At Segovia one still sees usages centuries old. It strikes one as strange to see on the wall of the staircase of one's hotel a notice to the effect that after midnight application must be made to the watchman for the key of the house. The same arrangement is in force both at Burgos and Zaragoza, but it was only at Segovia that I saw the notice painted up. The watchman is called "El Sereno," from his cry, which one hears every now and then echoing down the streets, if wakeful: "Ave Maria purissima! las dos," or "las tres, e sereno," for the weather is so generally fine in Spain that "sereno" is his customary cry. He goes his rounds wrapped in his great cloak and carrying a lantern, while in the other hand he holds a long staff like a halberd without the blade. To see the group separate to their various beats in the evening is a suggestion for a painter. Merchandise is still carried about the town on donkey-back, the usual wheeled vehicles one sees being diligences, or the hotel omnibus, though strangely-shaped carts come in from the country behind long strings of five or six mules gaily bedizened with tufted and jingling harness, with tilts constructed of reeds and with strange props and supports swinging below the body of the cart. But in the narrow streets of the town the dustman goes his rounds with a small donkey bearing panniers, or rather saddlebags made of a sort of reed plaited closely, into which all kinds of rubbish are rammed, until one wonders how it can be possible to empty them! The baker's cart is a mule with real panniers of wicker-work. The flour merchant carries his stock upon donkey-back, heralding his approach with a long drawn unmusical cry of "Harina-a-a"! and most of the other traders in eatables carry them about themselves. One hears in the distance a strange cry which becomes comprehensible as the vendor approaches, and one sees perhaps the hot roll boy calling "Paneritos Calientes," or the milkman, whose cry is "Lechero-o-o," though milk is also advertised by a few notes from the goatherd's pipe as he leads his flock through the streets, stopping at the door to milk them as required. In the shops the trades are queerly mixed up, as in an English country town, the most curious mixture which I observed being wax candles and pastry and confectionery.

The hotel not being large enough to contain the whole of our party, several of us had to sleep out, which gave us an opportunity of

seeing what smaller Spanish inns were like. Our inn, the Fonda del Leone, was reached by a narrow passage leading from the market place to the little plaza in which it stood, full of small shops on each side in which vegetables, fruit, fish and other wares were displayed, forcibly recalling the smaller "calles" in Venice, by which name Spanish streets are also known. The ground floor looked like an ordinary Spanish drinking shop, on the first floor was the eating room, "Comedor," where several peasants were eating and drinking; still higher, through a door and up an involved staircase we went to our room. All was as clean as possible—matting on the floor, whitewashed walls and comfortable beds. Neither flying nor creeping insects disturbed our repose, and the only point about which there was any difficulty was the supply of water.

I must acknowledge, however, that I have heard from a friend a dreadful account of his sufferings at Mérida in a room which looked quite as clean as this of ours did, so it may not be safe to count our experience as typical. At Segovia we had an instance of the anxiety of the Spanish innkeeper to satisfy the requirements of his guests. One of our ladies did

S. ESTEBAN, SEGOVIA.

not quite like the fish brought round at dinner, and passed it. The waiter went to the gentleman who managed the business of the party, and entreated him to find out whether she was unwell, or whether she disliked fish, and, though he fenced the question as well as he could, a special course was brought consisting of *raw ham!* which the lady felt herself obliged to eat under the circumstances.

Spanish sunsets are sometimes quite tropical in their splendour and recall the dream-pictures of Egyptian afterglow. At Segovia we had the good fortune to see one which lit up the upper part of the Alameda and the town, the green valley by the river being left in darkness and coolness, from amid which the rushing of the water over the weir below sounded soft and refreshing. The glow flashed up the valley, reddening the summits of the hills, and turning the whitewashed houses scattered here and there to sparkling jewels. As it slowly faded from the town the colours of the houses changed from pale orange through red and rose-colour, to a curious, pale amethystine tint, which seemed to shine rather by inner light than by reflection, and had a most weird effect, and the clouds in the western sky cooled and became slaty against the pale gold of the heavens as the day sank to its death.

**The Opening of the New School of Art at Bury** took place last Wednesday. It has been built at a cost of about £2,000.

## SWEDISH COUNTRY HOUSES.

By R. KEITH JOHNSTON.

(Continued from page 246, No. CCXXV.)

AS a house built of wood always "settles down" to some extent after it is built, as the material becomes gradually drier and drier, the outside boarding is at first put on in a temporary fashion, and, after a year or so from the building of the house, is all taken off and replaced permanently—sometimes, indeed, the other covering is not put on at all until the house has had time to shrink, though the former is a better plan, as the boarding itself contracts to some extent when first put up.

For the same reason the papers put upon the walls in the first instance are of inferior quality, as the final papering cannot be done until the building has become thoroughly dry and will not alter any more. To prevent the outer-boarding from becoming saturated with wet, as well as from æsthetic motives, it is painted, and with this protection, which should be renewed every three years, the house may be regarded as weatherproof, and, beyond the replacing of an odd board now and again, requires no more external repairs than do our English homes.

In a country where heavy falls of snow occur every winter precautions must be taken to give it no opportunity of lying on any of the wood-work, so there must be a plentiful supply of "weather boards" to shoot off the moisture from any position which would otherwise afford it a lodging-place.

The higher a house is raised from the ground the longer is its life, of course up to a certain point and subject to any special circumstances of situation, but about four English feet is generally considered ample to raise it beyond the effects of any exudations from the soil. Instead of the thick paper with which the house is lined, the interior of the walls is now frequently covered with "lat and plaster" as in England.

The floors in a Swedish house at once attract the attention of an Englishman, firstly because, except in winter, they are not covered with a carpet, and secondly on account of their pleasant aspect as compared with "bare boards" in his own home. Great pains are taken to make these floors what they are. In the first place the joists, which are only logs roughly squared with the axe, are carefully levelled. For this purpose straight-edge and spirit-level are employed, and any irregularities are carefully adjusted. The joists are much heavier than we use here, but are placed at a greater distance apart (usually 2ft.), so that while strength is assured, a pleasant elasticity is given to the floor.

The boards forming the floor are carefully selected, free from knots and of good white colour, and are usually much narrower than we are accustomed to. The manner of laying them, too, differs greatly from ours. In the first place the boards are all "tongued and ploughed," that is, a narrow projection on one edge fits into a groove in the edge of the next board, so that when all are laid the whole floor is one united layer of wood. The nails are driven through the edges of the boards, in a slanting direction so that in place of the ugly nail-heads and hammer-bruises so much in evidence on our own floors there is no sign of nail or hammer mark on the whole surface!

I may add that although such a thing as a "flooring-cramp" is unknown in Sweden, the joints are so tight that in a well-laid floor it would be a difficult matter to insert a knife-blade between any two boards! This tightness of joints is effected by the use of wedges when laying the floor, though it is assisted by the good quality of the timber selected for the purpose, and maintained by the frequent washings which the floors receive, their whiteness being the source of great pride to the Swedish housewife.

The same reason which prevents the outer covering being fixed permanently to the walls at first, applies equally to the floors, which are in the first instance laid so that they can be easily raised for their permanent laying when the house is quite dry. All skirting-

LYCKORNA, SWEDEN: A FASHIONABLE SEA-BATHING RESORT.

boards, dados, mouldings, and other woodwork of a "finishing" nature are subject to the same rule.

Timber being one of the best known conductors of sound, steps must be taken in a modern house for deadening the reverberations aroused by footsteps overhead, and this is effected in the following manner:—Before the floors are laid, boards, which need not be of great thickness, are nailed across the undersides of the joists, thus forming the ceilings to the rooms beneath, and the long troughs thus formed are packed with sawdust, which, though of the same material as the timber, is found to be an effectual absorbent of sound. This may no doubt be explained in the same manner as the exclusion of frost from the cellars by the use of stones which do not run right through the walls. This sawdust, however, must not be employed underneath a stove, where the packing consists of broken brick rubbish, or of sand, so that there may be no danger of fire.

The cold in winter in Sweden being so much more intense than we, fortunately for us, ever experience, precautions have to be taken against it which would be considered quite superfluous here, though the adoption of many of them would add in no small measure to the comfort of some houses in this land. For instance, as I sit writing these words my feet are rapidly becoming colder and colder, which makes me wish the builder of my house had followed the Swedish plan of providing in each room a raised step or "threshold," against which the door presses when shut, so that draughts along the floor are prevented. The doors themselves are also made to fit much more closely into their frames, and the windows, though we should consider them absurdly thin and light, both as regards frames and glass, afford far better protection from the North-Easter than our own heavy plate-glass concerns. The "sash" window, I may add, is practically unknown in Sweden, where the kind that opens on hinges, like a door, are always used.

A single sheet of glass, however, is not found to afford sufficient protection against the rigours of the Arctic winter, so when the cold weather approaches, second frames are put in on the inside, there being a space of about two inches between the glasses of the outside and inside frames; the joints are all covered with strips of paper pasted down so that no draught can get through, and the cold is effectually kept out. "So is all fresh air," will be the natural thought of an Englishman, therefore I must explain that one window in each room is left so that the inner window can be removed and the outer one opened whenever desirable. The strips used for pasting are coloured to match the paint of the frames, and are, therefore, not unsightly.

When spring arrives the inner windows are taken down and stowed away in cellar or attic until next winter. This putting in and taking out of windows all over the house sounds a rather serious undertaking, but as the frames and glass are so much lighter than we use, it is not so arduous as one would think, still, it entails a good deal of work, and in the most up-to-date houses the permanent window-frames are double glazed, with a space of half or three quarters of an inch between the

glasses, the inner ones being mounted in hinged frames to admit of cleaning. The warmth obtained by means of the double windows is due to the "cushion" of stationary air between the glasses.

Having provided for the exclusion of cold air, we will now turn to the question of creation of warmth inside the house.

In this the Swedes are far ahead of us, and, though I have to the full a Britisher's appreciation of the cosy appearance of our open coal fires—though, to my thinking, a wood fire on an open hearth is still better—I often wish I had either of the Swedish systems of warming in my own house.

The older of these is as follows:—In each room is an earthenware stove faced with ornamental tiles, and so constructed inside that the heat rises from the hearth nearly to the ceiling, descends almost to the floor, down a second flue, rises again to the top of the stove, and sometimes makes a further descent and ascent before reaching the pipe which leads to the chimney. This stove is called a "Kakelugn," which, literally translated, means "Tile oven," a name very indicative of the character of the article.

The hearth is approached through an opening about 15in. or 16in. from the floor, and about 12in. wide by 15in. in height, this opening being closed by folding doors of sheet-iron, which have small apertures covered by swivelling shutters. The iron doors, when closed, are concealed by ornamental ones of polished brass. The hearth is composed of fire-proof material about 15in. thick, and is solid, there being no grate. In lighting the fire an armful of birch-wood, cut into lengths of about 14in., and split into pieces rather thicker than a man's wrist, is piled on the hearth, and great are the arguments for laying them in this or that particular manner, whether all one way, or crossed, or all leaning upright against the wall of the flue, so that it does not seem to matter much how they are disposed. A few splinters from one of the pieces of wood are then ignited, and the whole pile is quickly in flames.

The draught is regulated to a nicety by means of a damper at the top of the stove, which opens or closes the pipe leading to the chimney, and the iron doors, which latter, however, are generally left wide open until the whole of the fuel is reduced to a glowing mass without flame. The doors are then closed, as well as the damper at the top of the stove (this is worked, by means of a cord, from the floor), and in a very few minutes the entire stove, from floor to ceiling, is quite hot—sometimes too hot to touch with the hand for more than a second or two. The room quickly becomes comfortably warm, even in the corner farthest away from the stove, and one can sit in comfort in any part of it. The warmth engendered by the quantity of wood named is sufficient to maintain a comfortable temperature for six or seven hours, the fire being re-lit in the afternoon, earlier or later, according to size of room and external temperature.

The other apparatus used for warming, and which is now very largely employed in Sweden, requires one fire only to heat the entire house!

In the cellar is a stove, or furnace, of iron, in connection with which are iron pipes, or flues, leading to a point near the floor in each room, or passage, where warmth is to be supplied. The mouths of these flues are fitted, in the rooms, with dampers, by means of which the supply of heated air may be controlled, and there are other dampers near the ceiling, connected with flues leading into the chimney, by means of which the vitiated air is allowed to escape.

The apparatus (which burns coke, not wood) is so constructed that the heated air is fresh air warmed on its way from the outside of the house to the various rooms, and the fumes arising from the combustion of the coke are led away up the chimney and do not come into the hot air pipes at all. The air being treated in this way—much the same, indeed, as our circulating hot water supply—is not unduly deprived of its moisture, so that it is in no way unpleasant or unhealthy, but rather the reverse; in fact, this apparatus is now strongly recommended by the medical profession for delicate people of all sorts, more especially those suffering from pulmonary affections.

This apparatus, as will be readily understood, must be situated at a lower level than the rooms it is expected to heat, as the hot air being lighter than that unwarmed, rises of its own accord.

In other respects a Swedish country house is not very unlike one in this country, though the appointments, such as curtain-poles, blind-fittings, door-hinges, lock-furniture, &c., are generally of a more simple character, and not so ambitious as ours.

The foregoing description must not be taken to apply to a house in Gothenberg or Stockholm or any of the larger towns, where, as already stated, stone and brick is the order of the day, and the floors will, in most cases, be found as well furnished with carpets as any in

PLAN OF KAKELUGN STOVE BUILT IN CORNER OF ROOM.

London, the dining-rooms, however, being very frequently laid in parquet, with, perhaps, a square carpet in the centre. But the purpose of this paper has been to show how our neighbours in the land of the Vikings build their houses, and how comfortable the said houses are to live in, different though they may be from our own.

**A New Church for Walton** is to be erected at a cost of £6,500, and the memorial stone was laid recently. Mr. J. Francis Doyle is the architect.

**A New Male Infirmary** is to be erected in connection with the Ecclesall Workhouse at a cost of £25,000, and the foundation stone was laid last Wednesday.

**The Foundation Stone of New Schools** at Cann Hall was laid last week. The building, which is 157ft. long and 63ft. wide, will be erected in Cobbold Road, and is to accommodate 550 children.

**A New Wesleyan Church at West Stanley** was opened last Wednesday. It has been built from designs by Messrs. Green and Brocklebank, architects, of Liverpool, and has cost £4,800. It is Gothic in style.

**A Memorial to the Kent Martyrs**, who were burnt at the stake for allegiance to the Protestant cause during the reign of Queen Mary, will shortly be unveiled by Lord George Hamilton, M.P., in the nave of Canterbury Cathedral. The memorial takes the form of a granite obelisk, surmounted by a Canterbury cross, with an inscription recording their fidelity.

## SOME ESSEX CHURCHES.\*

By J. GARD PYE.

WHEN asked to read a paper upon Essex Churches, I felt the task of condensing a subject so full of interest within the limit of a short paper would be a difficult one, so thought it better to confine my remarks to churches in the neighbourhood of Colchester, much as I should like to have enlarged upon the interesting Chapel of Great Peter on the wall at Bradwell, and St. Andrew's at Ashingdon, the latter being the oldest church now existing in Essex, and a good type of Anglo-Saxon work.

Colchester is well-known amongst archaeologists as the ancient Camulodunum, the earliest Roman settlement of importance. History tells us that this ancient town played an important part in the days of Boadicea. The town walls, evidently of Roman construction, are considered to be the best specimen that we have left in England, for while the masonry is not so perfect as in York, its full extent round the town is more intact. The Balcerne Gate is a good specimen of Roman work.

It is not my intention to dwell upon the fine old Norman Castle of which Colchester is so justly proud, as my paper is on ecclesiastical buildings only, but I should strongly recommend any member of the Society when in the neighbourhood to visit this old building, containing, as it does, some interesting herringbone work, and old Norman fireplaces in a good state of preservation. A good number of the churches in Essex, especially round Colchester, are of Norman origin, being restored or rebuilt later on in the Decorated and Perpendicular periods—more in the latter than the former.

St. Botolph's Priory, which was reduced to its present ruinous state during the siege of Colchester in 1648, consisted of nave, central tower, transept, and choir. This is a remarkable instance of the use made of Roman materials for building, and, singularly enough, these materials were used for the ornamental part, as can be seen in the west front. The bricks used were of the fourth century, and some even earlier. When the Royal Archaeological Society visited this building in 1877, several members pointed out some bricks that were as early as the first century, being only lin. in thickness. The west doorway is a good specimen of a Norman arch, with its zigzag or chevron, and billet mouldings, with a rude hood mould formed of tiles, and the interlacing arches from which it is said the Gothic arch of

later years took its form; but I think this is theory only.

The gateway is all that is left of the once large and handsome abbey, now known as St. John's Abbey gate. It dates from the time of Henry II., and has been very truthfully restored some years back by Major-General Montagu, of the Royal Engineers. Fortunately for him, one of the pinnacles was discovered buried in a wall, and from this clue he was enabled to add the others.

In the priest's doorway, in the ruins of St. Nicholas' Church, at Colchester, you again see the introduction of Roman bricks reused from some old building that had been pulled down. These ruins have given place to a new church that was designed by the late Sir Gilbert Scott.

A very interesting specimen of a Saxon doorway is in the tower of Holy Trinity Church, Colchester. Here we have another example of the introduction of Roman brick, and the primitive idea of ornament in the rude formation of the shaft, with cap and base, with the hood mould, and, as a sign of the religious revival, the formation of the Cross in the key of the arch. Ardleigh Church is a specimen of an ordinary Essex church, Perpendicular in style, with its tower, nave, aisles, and chancel. The porch contains some fine work in flint and ashlar work.

I should like to add here that the churches of East Anglia are different from those in the West of England, though there is much Perpendicular in each, the style being largely ruled by the materials at the disposal of the builders. Here there was little stone to be obtained, and they had to use flint, with facings of fine stone, which is the characteristic treatment of the district.

Great Bromley Church is another good specimen of an Essex Perpendicular church. The nave roof is very elaborate, having double hammer-beams, richly carved and picked out in vermilion. This church stands in the beautiful vale of Dedham, was the subject of one of Constable's paintings, and was built by a father and his son whose marks still remain in the tower. In this church, on the south side of the chancel, is an oven with flue complete, for the baking of sacred wafers, the only instance, I believe, in England of an oven in a church. The stairs to the roof loft still remain. The north porch has a narthex or room over, used either for storing parish documents, or as a library to store those books given to the parish, as in those days books were scarce, and such a gift was in consequence valuable. When these rooms had a fireplace in them and a window opening into the church, they were usually used as watching rooms and chambers.

Lawford Church has an interesting group of chancel windows of an earlier period than are mostly to be found in this part of Essex. Internally are some elaborate stone carvings.

Another fine Perpendicular church is at East

A SUMMER VILLA AT LYCKORNA.

Bergholt; it has an unfinished tower. The bells hang in a cage in the churchyard. There are several brasses and tombs in this church, and a window to the memory of the painter Constable, who was born in this village, and here painted many of his pictures.

The north porch of Boxford Church is one of the oldest wooden porches in England un-restored. The south porch is stone, which must have been brought from some distance, as there are no quarries anywhere near. The ceiling is very handsomely groined. There is a good specimen of a late Perpendicular door richly carved and moulded, and also a very handsome screen of stone in this church. This and the last two churches are, strictly speaking, not in Essex, but in Suffolk, but as they are just on the border of the two counties, and interesting, I have included them.

Great Bentley has a good specimen of a Norman door, with its zigzag and rose mouldings. There are several other Norman features in this church, including five windows. The staircase to the rood still exists. Fingringhoe has a Perpendicular porch, built in rubble work, finished with flint and stone in the parapet. In the spandrels are the Archangel Michael and the Dragon, evidently symbolical of heaven and hell, as the church is dedicated to St. Andrew and not to St. Michael, as these figures would lead one to suppose. This church was considerably damaged by the earthquake of 1884, and has since been restored. There are some interesting frescoes, including one of St. Christopher carrying Christ over the river of the waters of life, and an old oak chest, richly carved.

Brightlingsea Church contains good specimens of Perpendicular work, although it is clear from the buttress level with the chancel, which is of earlier date than the rest, that it is a fourteenth century church changed at the end of the fifteenth as regards the aisles with battlements and the tower added. The late Professor Freeman describes this tower as being one of the finest of its kind in existence.

The church at Copford was undoubtedly of Norman origin, having a vaulted roof, but the destroying hand of time obliged the substitution of a wooden roof, which is acknowledged by archaeologists to be a beautiful piece of work, and was much admired by the late Sir Gilbert Scott. The walls, which are very thick, were mostly built of Roman brick. The noted features of this church are its frescoes. In the apse Christ is represented seated on a throne with a rainbow behind, and clouds under his feet, His right hand in the attitude of benediction, and his left resting on a book, the wounds being visible in the hands and feet; below are angels, and in the background the towers of New Jerusalem. On each side and four apostles under canopies. Excepting the chapel in Canterbury cathedral, the late Sir Gilbert Scott said that in his whole experience he had never seen anything to compare

with it. The south porch to the same church was considered by Sir Gilbert Scott to be the most beautiful specimen of a Decorated wooden porch in the country. The door leading from the porch to the church was covered with the skin of a man who had been caught in the act of sacrilege.

Close by are the famous towers of Layer Marney, with its terra-cotta work, but as it is a domestic building it is out of my province in this paper to describe it fully; it is well worthy of a visit, however.

Marks Tey is a thirteenth century church, curious in its having the upper portion of the tower of wood. Great Tey Church is very interesting, with its Norman tower heightened at a later period. The plan of this church was cruciform, the nave and chancel being rebuilt in the Early English and Decorated periods. The old wooden porch to Aldham Church is of the Decorated style, and is mentioned and illustrated by the late J. H. Parker in his "Glossary of Gothic Architecture."

Bures Church, like that of Little Oakley, has the buttress of the chancel pierced for the priest-door, another good specimen of East Anglia Perpendicular work. The south porch is a good specimen of a treatment in brick, but of course is of later date than the church itself.

Mount Bures Church is another specimen of a Norman tower, but was heightened a few centuries later. Coggeshall has a fine Perpendicular church of large proportions, the interior

being richly carved. It is the largest church in Essex.

Little Maplestead was originally attached to the Rectory of the Knights of St. John of Jerusalem, founded here in the time of Henry I. Though restored in 1854, it is still of special interest as being one of the four remaining round churches in England, built on the model of the Holy Sepulchre; the others being the Temple Church, London; St. Sepulchre, Northampton; and St. Sepulchre, Cambridge. The chancel is an apse; the nave circular, with peristyle of six clustered columns. The western entrance has quatrefoil border. This church is said to have had the privilege of sanctuary.

### JERRY WAS A BUILDER-MAN.

(Sec. 170).

Jerry was a Builder-man,  
Of swindlers the chief,  
Jerry built a bad house,  
But he came to grief;  
The London County Council,  
When he was not at home,  
Pulled down Jerry's house,  
And left him in a foam.

### BALBUS THE BUILDER

(vide Latin Grammar).

(Secs. 103, 107).

Balbus, the Builder, built a wall,  
Which, when completed, threatened to fall;  
District Surveyor condemned it, when  
Balbus had to build it again.

A VILLA AT LYCKORNA.

## NOTES ON ART.\*

BY WILLIAM MEEK PAGE.

ART, we may premise, has had a life equal to that of mankind and consequently has a history interesting and educative in proportion to its length. Some remains found at La Madeleine belong to an age more than 50,000 years ago and show us that the sense of beauty existed in men who lived a painful and primitive life, making their homes in caves, but who had the impulse to adorn and to imitate natural forms. It is in Egypt, however, that we find the earliest works of art—dating probably from fifty centuries before the Birth of Christ. From that we can trace Art into Greece, where, from small beginnings, it developed to the highest perfection to which human labour has ever attained. Then in Italy, Grecian art in its decline revived into new forms and fresh life and vigour, through the great movement of the Renaissance, and thence down without a break to our own day.

## The Decay of Enthusiasm.

Through all this time Art flourished as a real live thing, and the people took an intelligent, active interest in matters artistic and made art a necessity almost of their lives. But now it cannot be said that enthusiasm for Art exists at all largely, and where it does is it not more in the form of amusement? Up to about the beginning of the present century the artists were allowed to pursue their mission as their art dictated. At this time, however, the public assumed to a great extent the rôle of teacher, and artists found that in order to live they had to pander to the uneducated public, and supply them with popular art. This was true to such an extent that James Smethan, an artist who lived some fifty years ago, was forced to exclaim that, in the pursuit of "the poetic," unless a painter could live independently of his art, he ran the risk of perishing on the mountains. This was the beginning of a dark time. Till now everything fashioned by man, from earliest times, was made, *in addition* to its primary purpose, with a desire to impart to it in form, ornament, or colour, something of beauty. Men now began to imagine that beauty was unnecessary to their happiness, and the march of civilisation had now quickened to a rush; buildings were thrown up regardless of the laws of beauty; engineering works disfigured our towns with unnecessary ugliness. Men lost sight of art in their eagerness to pursue and worship Mercury, and everywhere we have erections testifying, not to the nobility and philanthropy of the proprietors, but to their love of gain and utter want of good taste. And this has not ceased to-day by any means! Search your town from end to end, and you will not find more than a few modern buildings with any pretensions to beauty! Your suburbs are spoiled and rendered inconceivably dismal, and in the large cities huge, crowded tenements and frightful structures in iron testify to what I say.

## Popular Indifference.

Painters and architects, with few exceptions, alike suffered through being fettered and working for an indifferent, uncaring public, who did not, indeed, cease to give those artists commissions, but who insisted that the result should merely satisfy their passing fancy, and fulfil their utilitarian requirements. With this they are contented, and what is worse, they are proud of what they consider their achievement. The result is that to-day, at the close of the nineteenth century, the people for a great part are entirely indifferent to matters pertaining to art. "Why," you exclaim, "never was there so much heard about Art, never was it so popular, so universal, as it is to-day?" I will not deny that there is much talk about Art, but there is little Art spoken. I will not deny that Art, so called, is

popular, universal, but what is it in reality? "Oh," you say, "our sons and daughters paint, carve, and fret (a deal of it), and so adorn the home. Look at our children's work at school." But let us examine into it and see what it is all worth, what they attain. The boys carve before they can design, paint before they can draw, and fill our homes with useless "knick-knacks," and cover our walls with painted plaques and panels; here we have no art, but only a little technical skill. The girls are not taught the elementary principles of Art, and what is good and beautiful and what is not, at school, but are taught to pass the examination and earn the grant. I have known students to spend an entire session making elaborate drawings of a single cast or piece of building construction, while they might have been occupying their time to better purpose, studying and sketching a dozen others, and so acquiring a knowledge of their work and art. Here, I say, we have only a degree of technical skill. Designs are bought for so much per dozen and traced on, or copied with more or less accuracy from some perhaps not over correct print or plate. And then, moreover, why should art be confined in gilt picture frames? What does it avail if the knowledge of the beautiful and the good which is supposed to be acquired in the studio be confined there? And, as an evidence that Art is by most regarded only as an amusement, we have almost no art outside of the studio and its other acknowledged homes. Art should not be confined to the picture frame, to the gallery and exhibition, but should pervade and permeate everything and every place. It is not sufficient to have it in chalk and pigment, merely to beautify and adorn, we want it in material, we want to see it, feel it, understand and benefit by it and be artistic and cultured in all we do. Our towns have lost much of their charm, our streets are dismal, and our houses and homes are, with but few exceptions, quite the reverse of beautiful.

## Some Definitions.

And here, I think we might well pause and ask, "What is Art and what is an artist?" Shortly, Art is the interpretation of Nature and an artist is the interpreter. Or art may be described as the work of man expressing his ideas in painting, sculpture, or architecture. In the two former the artist accomplishes this by directly imitating Nature, but the latter, again, has to create its own forms and at the same time follow closely the laws and methods of Nature, especially where structure is concerned, only in the decoration of surfaces imitating natural forms of plant and animal life. An architect myself, I may be tempted to dwell at length on that department of art with which I am more particularly associated and omit to render—justice, I was about to say—due attention to the art of painting, which after all is a mighty factor in the world of Art even to-day, so I will make amends by dealing with it first. Those painters, I say, have missions, and right nobly do many of them pursue them. Wedded to their art as they are, they are great teachers. Theirs is often a hard life and they have trying work, for they have to conceive, feel, and suffer, or excitedly enjoy every new subject, and have to search the world over for ever new materials to enable them to realise their ideas.

## The Painter and Sculptor.

The artists are interpreters of Nature, they reveal something which we did not previously perceive, and our interest is awakened, and the indifference which was ours of old is usurped by a new delight, and we are led to look "from Nature up to Nature's God." What I have said regarding our painters applies equally well to the sculptors. They make the sculptured marble almost speak, who adorn our palaces with reproductions of the most beautiful thing in the world—the human form, giving us in the round representations of heroes of war, science, and art, and, which is better still by far, creations of their own imaginative genius, setting them on lofty pedestals whereon we may behold them, learn, and be elevated. And now we shall pass on to the consideration of that Art which has to do with the building, finishing, and decora-

tion of our houses and other edifices. I will the more easily show you what is good by first pointing out much that is bad, and, putting the two side by side, try to discriminate between them. We have learnt that Art is an interpretation of Nature. We may now attempt to define it at more length. The word "Art," according to its derivation, means that which is fit. Art is fitness, truth, directness of purpose, simplicity, sincerity, refinement, and, in order that a building may rank as a work of art, several things are very essential.

## The Essentials of a Building.

(1) Fitness for the purpose which it is intended to fulfil; (2) Good construction and workmanship in its erection; and (3) appropriate adornment, based upon its use and construction. That is to say, the building shall primarily fulfil all necessary conditions which are required by the occupant, whether as a home, factory, or public building. The construction shall be sound and genuine, and the workmanship of the highest order, employing the various materials in the most consistent manner. Added to this the building requires to be so grouped and disposed that its various parts shall each have sound proportional dignity, and, lastly, the decoration shall be such as is dictated by its character and construction. Do not let there be a scheme of elaboration on the exterior which is not carried out inside; or on one front and wanting on the others. Do not allow one part to contradict another, let there be no inconsistencies, but let the one idea, the one feeling, pervade the whole, expressing outwardly and inwardly the same thing. To the average man any talk about an artistic house and beautiful furnishings is quite unintelligible. It is sufficient for him if the drains are certified to be in good order, if the name of the house is in large gilt letters over the door, and there are the required number of rooms, provided with windows much too large, and high ceilings. Often when an architect is employed he is politely bowed out just when the bare house is completed, and then the worthy client proceeds to disfigure it with inappropriate furniture and decorations, carrying to an unworthy conclusion the architect's scheme. Hence we account for so many ignoble buildings, much of the sordidness of our cities. Hence those unsightly arteries stretching away into the green country with high, expressionless buildings, causing cold, draughty streets, and making a walk through them one long, monotonous progress.

(To be continued.)

**The Berlin Statue of Bismarck** is being erected in front of the Reichstag. The statue will be nearly 20ft. high.

**St. Michaels' Church, Shap,** was reopened last week, after alterations and repairs. The whole of the church, with the exception of the tower, the Norman arches, and a portion of the north and south walls, has been pulled down and entirely rebuilt under the supervision of Mr. Oliver, architect, of Carlisle, Mr. Grisenthwaite, of Penrith, being the contractor. The cost of the work has been about £2,900.

**A Great Hall for New York.**—A new Hall of Records is to be built at New York. Two million dollars are to be spent on the external building proper, and two and a half million dollars additional to complete the interior. It is estimated that the sculpture work will cost 85,000 dollars, and the mosaic work 10,000 dollars. No wood whatever will be used, the interior being entirely of coloured marble, and the window frames of copper.

**The Restoration of Rackenford Parish Church,** North Devon, has been carried out under the guidance of Mr. A. Bloomfield Jackson. It has just been reopened. A new roof has been given to the church, the old carved oak ceiling cleansed of whitewash, the sanctuary enlarged, a chancel formed, the whole church repaved and wood blocked, the seating modernised, and some oak choir seats, pulpit, and reading desk have been placed in the chancel.

\* Abstract of a paper read before the Perth Architectural Society on March 14th, 1899.

## ARCHITECTURAL ASSOCIATION.

## THE ANNUAL DINNER.

THE Annual Dinner of the Architectural Association took place last Wednesday evening at the Holborn Restaurant. The chair was taken by the president of the Association, Mr. G. H. Fellowes Prynne and about ninety members and guests were present. After the toast of "The Queen" had been duly honoured, the president proposed "The Church and State." After some general remarks on the relation of Architecture to the Church, Mr. Fellowes Prynne proceeded to refer to the

## St. Paul's Decorations.

After paying a tribute to the high aims of those who authorised the work, and of the artist who carried it out, the President said that as architects they were bound to take up a critical attitude. They looked upon St. Paul's Cathedral as a national monument designed and built by one of the ablest architects England ever produced. Therefore they had a right, as architects, to speak on such a subject. Sir William Richmond, in his famous letter to the "Times," put himself on a very high pedestal and ignored the views of architects. It was the wish of them all that nothing should be done that was in the slightest degree discourteous to Sir William Richmond; at the same time they could not look on at this noble monument being utterly ruined at the hands of one able man. The President rejected in emphatic terms the idea expressed by Sir W. Richmond that St. Paul's Cathedral is a magnificent skeleton to which colour must be applied to give life to it. If an artist wished to experiment, a great national monument such as St. Paul's was not the place for his experiments. The cheers of the audience clearly showed that they were in general agreement with this view of the matter. Proceeding to speak of the Houses of Parliament, Mr. Fellowes Prynne commented upon the general indifference of our legislators to architectural matters, and pointed out the contrast between the money spent on architecture in our wealthy England and that spent by a little nation like Belgium. The Law Courts and the Colonial Offices were mentioned as examples of the way estimates were cut down, so that the architects concerned had not a fair chance to produce worthy buildings.

## Archidiaconal Humour.

The Archdeacon of London, Dr. Sinclair, as a member of the Decoration Committee, had a somewhat delicate task to perform in replying to the toast. But he accomplished it with great skill and excellent taste; there was a dry humour in many of the Archdeacon's remarks, which was not the less appreciated by the architects present because it was directed against their own class. It was part of his duty, he said, to inspect the fabric of churches, and he found that many modern churches were rather thinly built, but the reason of that probably was that there was not sufficient money to carry them out in a substantial manner. He also found them often badly ventilated; when there was a large congregation the air became very foul, and the congregation often very sleepy. He would like to pass a law that all churches should have a row of goodly ventilators breaking the sky-line of the roof. He had lately inspected a church in East London, built by an eminent architect, of which the doors were so narrow and so beautiful that it was impossible to get a coffin through them. Not all modern churches, however, were thus defective, and the Archdeacon spoke in very appreciative terms of the work done at St. Saviour's, Southwark, St. Bartholomew's, Smithfield, and St. Philip's, Stepney. Modern architects were very conservative, but he could remember the ruthless way in which, under the purist impulse of the Gothic revival, many beautiful old things were swept out of our churches because they happened to be Renaissance or Elizabethan or Classical, and not consistent

with the original Gothic style of the church. "So when you are giving us the benefit of your advice, you must remember that the advice of your predecessors has not always been quite the wisest possible." In this bantering way the Archdeacon led up to

## An Important Pronouncement

on the subject of the hour, the St. Paul's decorations. He, in common with many members of the Committee (he was careful not to say all the members) welcomed the frankest and freest criticism. They did not set up to be eminently qualified to judge of this question. The Committee was at present too weak to bear the strain of so great a work, and they ought to have the assistance of some architects who were versed in the Palladian system, and able to separate Palladian ideas from Gothic ideas, and who were in full sympathy with Wren. They ought to get the most consummate advice possible, and he thought the committee should include the President of the Royal Academy, and he would even add the President of the Beaux Arts in France and someone of corresponding position from Germany. Passing on to speak of the history of the question the Archdeacon showed that he does not approve of all that has lately been done at St. Paul's. He expressed a hope that future generations would remove parts of the reredos and all the stained glass windows. Then in a few weighty words the Archdeacon practically endorsed the main criticism that has been passed on Sir W. Richmond's work. If, he said, he might venture to offer advice to any decorator, it would be: let him suit his ideas to the building, not the building to his ideas. Even if the great builder made mistakes in some points, the building should be left as he left it. It was true, as the papers had stated, that the committee had determined to take off the stencilled work and to reconsider the putting of panels upon the curtained walls. They had received a letter from Sir William Richmond, expressing his agreement with the resolution of the committee, and when the work was resumed Dr. Sinclair believed the result of this discussion would be satisfactory to the artistic minds, both of the artists and the architects of this country.

## Parliament and Architecture.

Sir Henry Howorth, M.P., who responded for the Houses of Parliament, admitted that neither in the Lords nor the Commons had the arts received that attention one might expect from a nation with such a long history. But when nations were making history they were very seldom artistic. Sir Henry then entered upon a rather curious defence of this Parliamentary indifference, the gist of which seemed to be that it was better for architects that they should be left alone by Parliament than that they should be hampered and restricted by the edicts of a public official. In spite of all difficulties we had had a succession of magnificent buildings, but there had been very few people indeed who had known how to decorate those buildings. Could anything be viler, he asked, than nine-tenths of the stained glass in this country?

## The R.A. and the R.I.B.A. defended.

The toast of "The Royal Academy and the Royal Institute of British Architects" was proposed by Mr. H. H. Statham. It was inevitable that the proposer of such a toast should take up an "official" attitude, but there were some interesting points in the speech. Mr. Statham made an ingenious defence of the Royal Academy. He pointed out that it was a modern characteristic to open new galleries as a kind of protest against the conservatism and prosaic character of the old ones. But he declared that there had never been a year in which you could not have taken out of the Salon and the Academy enough good pictures to crush the other exhibitions. He admitted that a lot of mediocre work was shown at the Academy, but hinted that the admission of such works might be defended on philanthropic grounds; the question was whether the family or Art should come first. Perhaps Mr. Statham's strongest point was his contention that neither the Academy nor

the R.I.B.A. could create genius; they could only promote artistic education, and uphold the standard of technical excellence. Thus the Academy was right in excluding Rosetti, who, though, no doubt, a greater genius than most of the Academicians, admitted that he could not draw the figure correctly. Similarly the R.I.B.A. could not decide that one man was an architectural genius, and another was not; it could only decide whether a man was a thoroughly educated architect from a practical point of view.

## An Example in Gallantry.

Mr. Aston Webb, A.R.A., responded in a brief and modest speech. He defended the Institute with much humour against those critics who maintained that its movements were of the steam-roller type. A few years ago, said Mr. Webb, a gentle tap was made at the doors of the Architectural Association, and ladies asked for admission. There was a great flutter in the Association, and the ladies were not allowed to enter. Of recent years the same tapping had been heard at the doors of the Institute. In this case the bolts were withdrawn, and now they had a full-fledged lady member. "You younger men will say," said Mr. Webb, "that your hearts are so warm and ours are so cold that the reason is obvious. I think, however, it is a sign that we are prepared to move with the times." Mr. H. L. Florence also responded.

## Sir Edward Clarke's Speech.

The toast of the evening, "The Architectural Association," coupled with the name of the President, was proposed by Sir Edward Clarke, Q.C., M.P. After speaking of the special position in the architectural world occupied by the Association, Sir Edward Clarke spoke of the difficulties of the architectural profession in general. Architecture was an art the study of which was, he thought, more difficult, more full of complex problems, making more demands upon the capacities of the men who devoted themselves to it than any other art he knew. That it was an art, no one could deny; but it was an applied art, with a scientific side to it, and he had always felt that among the many occupations to which a man could give his life there was none that combined a greater degree of enjoyment of artistic life with the responsibility of scientific study. The great art of Architecture was limited and controlled by considerations which did not affect what he might call the more ornamental arts. It was limited and controlled by considerations of expense, and of the convenience of those who were to use the works when produced. The best possible house that they could design was liable to be interfered with and spoilt by the man who was going, not to look at the house, but to live inside it. He might consider, for instance, that a serious modification ought to be made in the matter of a bath-room.

## In Praise of Architecture.

Sir Edward spoke with eloquence, and an enthusiasm rare in a layman, of the value of architecture to the world at large, especially in its application to religious buildings. In every creed, under every sky, whatever the character of the religion might be, the worshippers who went within the walls of the temple found inspiration in its architecture. After sitting in silence and contemplation in the marble cathedral at Milan or in St. Mark's at Venice one could not fail to understand that the architect had been through the ages of the past and would still be, if he was true to his mission, one of the greatest and noblest teachers, with one of the highest inspirations and missions it was possible for a man to have.

## What the A.A. is.

The President, in his response, reminded those who were visitors that the Association was practically the only society for the education of architects. Not only students were their members; amongst their 1,300 members only 200 were students, the others were men who had passed through its classes and retained their membership. He appealed to the profession at large to join their ranks, and to their own

students not to let their enthusiasm flag.—Mr. Beresford Pite, in proposing the health of "the guests," made some sensible and practical remarks on the need for tempering artistic enthusiasm with common-sense considerations. He referred to the Oxford Museum as an example of the indiscriminating application of artistic theories. It was a result of Ruskin's "Stones of Venice," and was much admired at one time, but had now become a mere laughing stock.—Alderman Hind, the Master of the Plumbers' Company, and Mr. Reginald Blomfield responded to the toast.—The remaining toasts were: "The Committee and Officers," proposed by Mr. F. T. W. Goldsmith; and "The President Elect," proposed by Mr. W. H. Seth-Smith.—Some capital musical selections were given during the evening by Messrs. S. Constanduros, H. Passmore, Gervase Bailey, F. D. Clapham, and G. B. Carvill.

## R. I. B. A.

### THE PLANNING AND CONSTRUCTION OF BOARD SCHOOLS.

BY T. J. BAILEY.

(Continued from page 249, No. CCXXV.)

UNDER the head of Buildings for the Training of Teachers, the author described a scheme of buildings for this purpose, which might be considered as very complete, and as embodying all that is likely to be required in the future. On the ground-floor are provided four classrooms for forty-two and thirty-six, two of each, seated with single desks; a central hall, 50ft. 6in. by 33ft. 6in., with staircases, &c.; at each end on the first floor are four classrooms, and a properly equipped gymnasium over the hall; on the upper floor an art room over the gymnasium, the remainder of the floor being devoted to chemical and physical laboratories, lecture room, balance and dark rooms. A basement is provided for the engineering apparatus, and also a kitchen for the preparation of luncheons. The site of the particular buildings dealt with was large enough to give space for lawn-tennis on the girl's side, and for football on the boys'. The buildings for

#### Industrial and Truant Schools,

which next came under consideration, must be of an essentially different character from other buildings of the Board, as they are Boarding Establishments. Descriptions were given of a building recently erected for this purpose in connection with the Shaftesbury Training Ship, and also of the Upton House Truant School, the only building yet erected specially for the purpose. The Board are negotiating for a large site of some fifteen acres in the neighbourhood of London for the purpose of erecting two establishments—an industrial school for about 120 boys, and a truant school for a like number. The two institutions will be entirely separate as far as their occupation and management are concerned, but will probably be under the control of one superintendent and body of managers. Details of the proposed plan and general arrangements of the buildings were given by the author. For the purposes of the administrative work of the Board, London is divided into eleven divisions, necessitating a corresponding number of office buildings. The offices for the East Lambeth Division, now being erected in the Peckham Road, were selected for description as a typical block. On the ground floor is the entrance hall, a large room 57ft. by 22ft. for the visitors to perform their clerical work, a room for the assistant superintendent, and an office for the check clerk, also the lavatories, w.c.'s, &c.; on the first floor a committee-room, used also by the superintendent, and a clerk's office; on the second floor the correspondents' and clerks' offices, and caretaker above.

In the few general remarks with which the paper closed, the subject of cost was dealt with.

The Princess May School, Kingsland, was cited as a typical case, and as tenders were received only so lately as March of the present year, it may be considered as up to date. The building is to be of three stories, to accommodate 1,548 children, on a site of about 1½ acres. The cost per head is estimated to be £13 18s. 4d. This includes building the whole of the brickwork in cement, also the provision of glazed bricks to staircases, corridors, and dados for classrooms and halls, but does not include furniture. The cost of inclosing the whole site with walls and railings, tar paving, drainage, and provision for deep foundations below a normal depth of 6ft., is about £5,000 more. The total cost will be some £750 within the limit allowed by the Education Department. There was a suggestion a few years back that unnecessary expenditure was incurred on architectural adornment, and the committee dealing with this branch of the work ordered two or three schools to be built of stock bricks and slate roofs, with no architectural features about them. It was found, however, that the difference of cost between bare utilitarianism and buildings designed in some sort of style and regard for materials and colour was rather less than 5 per cent.

### THE DISCUSSION.

The Hon. E. Lyulph Stanley, Vice-chairman of the London School Board, said that to build a public elementary school was a matter which could not be approached simply by architectural skill and knowledge, because the conditions were special. The best thing to do in planning schools was to follow the policy of the particular School Board or other managers of schools who employed them. In the planning of schools the architect had many difficulties to contend with in peculiarity of site and aspect, but to thoroughly know what a school ought to be he must be familiar with what had to be done in the school. Mr. Bailey had laid down a number of propositions as to what was best and most desirable, but at the same time his idea of what was best in some cases must have been limited by the parsimony of his employers. In describing what a classroom should be like, he mentioned that he would put glazed bricks as high as the dado, and then a wall of ordinary bricks. The speaker thought that if Mr. Bailey was to be employed by a provincial School Board—say Liverpool or Birmingham—he would probably find that

#### Their Standard of Requirements

would demand that the walls should be thoroughly finished with plaster, and not left in the rough brick; therefore he did not think because Mr. Bailey, working for economical, not to say parsimonious, employers, had indicated certain roughness of finish in the building that that really indicated the type of finish an architect, free to advise his employer, would consider was the proper one to adopt. He agreed with Mr. Bailey that the furthest scholars ought not to be more than 20ft. or 22ft. from the windows, getting their light from the left; but Mr. Bailey had not told them in how many of these matters the School Board for London had had to carry these points by force against the Education Department. They had even been invited quite recently to make their furthest row some 24ft. from the light. With reference to the

#### Use of Halls

in dealing with the discipline and education of children, that was a school-manager's question, not an architect's. If a room was to be used for one purpose, it had better be constructed for that purpose, and no attempt should be made to make it serve some other purpose. The department had sometimes suggested in the interest of supposed economy that they should put a class in the hall. It was apparent to architects how bad it was to have a class in a room 50ft. by 30ft. which was used as a passage for children going to and from their various classrooms. It also put a great strain on the voice of the teacher. Architects, in considering a school plan, should concentrate their attention first and foremost

on the arrangement of the classrooms. Mr. Bailey spoke about the

#### Stepping of the Floors,

but experts were not at all agreed as to whether the floors of classrooms should be stepped or not, and whether the platform from which the teacher delivered instruction should not be raised and the floor flat. These were things yet to be decided. The questions as to the size of a classroom and the cubic content depended very much upon the rapidity with which the air could be changed. There was not the slightest doubt that for the facility of a class seeing the blackboard, and for the diminution of the strain upon the teacher's voice, and for lighting the room quite to the back from the windows, it was not desirable to make the classroom a bit larger than was absolutely necessary for the health of the children. Teaching was much more pleasantly conducted in a moderate-sized room than in a large one; but they must have air. Mr. Bailey, he thought, had not fully brought out the importance of varying the

#### Size of the Classrooms.

The work of teaching in the more advanced classes made smaller classrooms necessary for the higher divisions, in order to lessen the strain on the teacher. There had been days when the Education Department recognised in its Code a class of eighty, and in those days an economical School Board built classrooms for eighty. One result of planning schools in that way in the earlier days was that, now that people had a higher idea of what was due to the teaching of children, a certain amount of space was wasted. Fifty children, for instance, were put into a classroom originally planned for sixty, with the result that ten places had to be written off and were unavailable. But it was policy that determined place, and it was not the architect who determined the policy; it was the Education Department, or the particular Board who employed him, and the public opinion of the country. He hoped that architects would make themselves acquainted with the requirements of school planning, so that they could make recommendations to the Board when they were called in, and their influence might do something to educate the Board who employed them.

#### A Schoolmaster's Views.

Mr. C. J. Dawson, Headmaster of the Alden-Street School, St. Pancras, said that he could only speak as a teacher in one of the schools which had certainly not been designed on the methods set forth in Mr. Bailey's paper. In the building he was engaged in there was one large room which accommodated over eighty scholars, and it was only separated from another room, which accommodated sixty scholars, by a sliding partition. Two others at each end of the building were separated by slight walls and partly sliding partitions there held over forty each. If they were taken together they were very inconvenient and too large for a teacher to properly manage, and if taken separately they were smaller than the Board and Education Department required to be placed under the control of a single teacher. The question of warming and ventilating was a combined question, because if scientific principles could be thoroughly applied, there should be a system possible by which the warming should help the ventilation and the ventilation assist the warming, in one way, by supplying cool air in the summer time and warmer air in the winter. If the system referred to by Mr. Bailey fulfilled all that was claimed for it, it ought to be put into operation in every school where it was possible—at all events, in every new school, unless the cost was so large as to be utterly prohibitive. But in many schools he was acquainted with the ventilation was an entire failure by the system provided. The points mentioned by Mr. Bailey that there should be no dark corners, and no pupil should be seated too far from the light, were important. Nothing had been said about the

#### Acoustic Properties

of the rooms. Many rooms in a school were not at all well-adapted for sound. Before he

came under the London School Board he had had to manage the whole of a school in a large room, over 60ft. by 30ft., and fully 20ft. high. Several classes were taught in that one large room, and the echoes were so confusing that it was a very great strain upon the teachers' voices, and they had a difficulty in making themselves heard distinctly by the scholars. This matter of acoustics certainly affected the question referred to by Mr. Stanley as to classes being held in school halls.—Mr. E. W. Mountford proposed a vote of thanks to Mr. Bailey for his interesting paper. The reference to the

#### Warming and Ventilating

of the buildings had interested him most, as some years ago plans of his had to go before the late Mr. Ewan Christian, acting on behalf of the Charity Commissioners, and he, with the later buildings of the Board before his eyes, absolutely refused to allow any kind of mechanical ventilation to be put into the building. Mr. Christian said he had been examining many of the London schools, and had come to the conclusion that there was nothing in the way of ventilating to equal windows. The "Plenum" system, which Mr. Bailey appeared to have adopted, was probably the best; but he should be glad to hear his opinion of that system in ten years time. It was said of the "Plenum" system that it was equally available in summer for forcing in cool air. That was a great mistake. People, he said, did not mind having air forced into a room so long as that air was warm, but when cold air was forced in, the inevitable result would be that the occupants of the room would block up the openings.—Mr. R. Phé Spiers seconded the vote of thanks, and said that he had built two of the first Board Schools, and he could now see that they were built entirely wrong, but they were built according to the policy of the Board at that time.—The vote of thanks was carried with much applause, and Mr. Bailey, in responding, said that he had tried to make the paper as comprehensive as he could, as he thought it right that they should be acquainted with details of the extensive work the School Board were carrying out.

#### Attractive Schools Wanted.

The Chairman considered that if children were put into rough, uncultivated, unattractive places they could not be expected to gain that admiration of form and colour which was so necessary to human happiness. He thought that the walls of their schools should be covered with beautiful tiles or enamelled bricks; that the best art England could supply should be constantly before the children when their attention was not engaged in their lessons; and that everything should be as simple as possible, but with a certain amount of grace, so that their faculties might be cultivated to admire the beauties of nature round them. He had found that even those students who were specially devoted to form and colour had a remarkably small observation of the objects of nature by which they were surrounded—the simple shells, flowers, and leaves. If that was the case with people who are trained to study, how much more so was it with those whose artistic faculties were left dormant, and who were surrounded with ugliness? He hoped the gentlemen interested in the work of the Board would give thought to the subject he had mentioned.

#### An Announcement.

After the discussion, Professor Aitchison announced that the next meeting would be held on Monday, June 12th, for the purpose of receiving the report of the scrutineers with respect to the election of the council and committee, and to elect the candidates for membership; also to discuss the report of the committee appointed to consider the administration of the building bye-laws in non-metropolitan districts, which report will be used to members with the next number of the journal; and, further, to consider a resolution on party structures, recommended by the committee, and approved of by the council.

## Views and Reviews.

### DURHAM CATHEDRAL.

Charles Lamb devided his library into two classes; one books, the other dictionaries, gazeteers, and the statutes at large. Were he living now, he would have no hesitation in which category to place Bell's Cathedral Series. The sixteen volumes which have appeared are painstaking, fairly accurate compilations; but they are not books. The one exception is the York volume, where Mr. Clutton Brock is refreshingly human in his vigorous criticism of the York design. If Mr. Ruskin's axiom be accepted, that the best work is that which gave the worker most pleasure, then the series will not rank high, for the books are but compilations; there is hardly a word in the volumes before us which one has not seen elsewhere. One hardly sees for whom the Durham volume is meant; if for architectural students, then why is the vaulting not shown on the plan, and some account given of the theories as to its chronology—the most difficult and important problem in English archaeology? The author does not even recognise that the problem exists. For the layman, on the other hand, the book is dry as dust and technical. As in most of the other volumes, the author seems never to have seen any church except the one he has been commissioned to write about. It is quite remarkable how he ignores the comparative method of treatment—a method which, in the hands of Professor Freeman, e.g., in treating of Peterborough, Ely, and Norwich together, gave such valuable and interesting results. We might have had here too what we have not, an account of the derivatives of Durham, viz., Lindisfarne, Dunfermline, Waltham, and Selby abbeys; and, on the other hand, a comparison of some of the Normandy churches, such as Cerisy, to which Durham is so closely akin. The author need have gone no further than Ruprich-Robert's "Architecture Normande." The result is that, having studied apparently only one church, Mr. Bygate sees nothing abnormal anywhere in Durham. He is not surprised that the magnificent Norman ironwork of one of the doorways is French, though it is almost unique. He is not surprised that the monastery was approached from the east, and that the monks' dormitory was on the west side of the cloister—probably being unaware how unusual such an arrangement is. He informs us that the ambulatory or eastern choir-aisle is far less common on the continent. It occurs in very early days in St. Martin, Tours; also at Vignory, Cluny, Paray-le-Monial, S. Benoît-sur-Loire, and is common in Burgundy and the south of France. Page 72 tells us that the Lady chapel was provided for the benefit of the ladies, as they might not enter the cathedral; he adds that women were allowed to enter the cathedral as far as a line drawn immediately west of the north and south doorways of the nave. Then we have long names introduced without any idea of their meaning. The Byzantines and the Lombards are here as usual. *Que diable allaient-ils faire dans cette galère?* How did they get to Durham? "Lombardic" capitals are figured in the crypt of the castle; they are just the ordinary Ionic capitals, which were in use all over Normandy and England in the latter half of the eleventh century. F. B.

"Durham Cathedral," By J. E. Bygate, price 1s. 6d. London: George Bell and Co.

### HADDON HALL.

This is no ordinary guide-book. Mr. Cheetham has chosen a hackneyed subject, but he has treated it in a manner that is refreshingly original. Without troubling much about historical and antiquarian details, which would interest only a small proportion of visitors, the author makes his appeal to the ordinary tourist, and tries to show him the significance of many matters that the ordinary guide book overlooks, and the ordinary tourist lacks knowledge to discover for himself. Mr. Cheetham's chief aim is to make Haddon Hall interesting to the tourist as a piece of architecture. He

begins with a few remarks—necessarily of a very elementary character—on styles of English architecture, and then proceeds to discuss the development of domestic architecture in England in the middle ages, from the Norman Castle to the Elizabethan mansion. This brief study in architectural evolution is a model of clearness and simplicity, and is admirably calculated to awaken in the non-professional reader a new interest in matters architectural, and to render a visit to Haddon Hall a far more interesting and profitable undertaking than it would otherwise have been.

Mr. Cheetham then proceeds to apply the general principle he has been explaining to the particular case of Haddon Hall, and clearly shows, with the aid of a plan, the various periods to which different parts of the house belong. He then button-holes the reader, so to speak, and conducts him through the various rooms, pointing out the special points of interest in each. In an interesting chapter on "Some General Characteristics of the Building," the author points out the remarkable unity of architectural character which Haddon Hall displays, although the various parts were built at so many different periods. The Elizabethan work, for instance, is far more Gothic in character than might be expected. This, the author considers, is largely due to local workmanship. "We can imagine several generations of builders and craftsmen, perhaps belonging to the same families, following one another in the work at Haddon, and getting so accustomed to Gothic treatment and forms of mouldings as to continue unconsciously to build in that style, having little or no knowledge of the outside world."

A few historical notes are added and the book is illustrated with a number of sketches by Miss Josephine Norris and the author. We could do with more guide books of this sort. It would tend towards a more general appreciation of architecture if those in charge of other historical buildings frequented by tourists would arrange for the publication of an explanation of their architectural characteristics, as lucid and intelligent as that supplied by Mr. Cheetham in the case of Haddon Hall.

"Haddon Hall: Being Notes on its Architecture and History for the use of Visitors." By F. H. Cheetham. Price 1s. Bakewell and Buxton; C. F. Wardley, "High Peak News" Offices.

### HAMMERED AND REPOUSSE SILVER.

It is difficult to feel enthusiastic over Mr. Gilbert Marks' exhibition of hammered and repoussé silver work at the Fine Art Society's gallery, though one would like to be able to do so. Every attempt to lift the applied arts out of the mud deserves our sympathy and help, and we would wish to give them freely to Mr. Marks. But somehow he irritates us, and we hardly know why. It is hardly kind to call his work commonplace, and perhaps it is not quite true; but there is in some of his things such an entire lack of design, of feeling for form and arrangement; and then, perhaps, we detest reproduction of natural flowers in hammered silver. There is a set of tea pot, jug, and basin; well—most people would prefer a Queen Anne or early Georgian. Because a thing is hammered and repoussé, that is no excuse for poverty of form. Of Nos. 3 and 28 what more can be said? We prefer Nos. 48 and 50, which have some shape and richness of effect, even though much of the ornament consists of naturalistic flowers; and Nos. 55 and 57, large plates purchased by the Vintners Co.; and No. 53, another large plate. The fact is that we are rather out of touch with Mr. Marks' style of work; it is not the sort of thing we would like to do ourselves, so perhaps we are blinded to many good points in it by lack of sympathy; but after all, much worse things than these would still be far better than the late Victorian teapot of commerce.

**A New English Church at Weimar.**—The foundation stone of a new English church was laid at Weimar by the Grand Duke last Thursday.

## Correspondence.

### SMALL COMPETITIONS: ARE THEY DESIRABLE?

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, N.

DEAR SIR,—I don't agree with your correspondent H. W. W. It is all very well for men who are well established in the profession to object to these small competitions. But for the beginner they are an undoubted boon. No one will give a commission to the young man just starting business for himself; the client assumes that the older and more experienced men must be able to carry out his wishes more satisfactorily. But if he enters an open competition, the beginner's designs are considered on their merits only; he stands an equal chance with the man who can write the magic initials F.R.I.B.A. after his name. With many eminent architects the winning of a small competition has been the first step on the ladder which has led to their present exalted position. Let them not, then, kick away the ladder by which they rose.

By all means let us have fair and reasonable conditions in all competitions, but do not let us condemn the system because sometimes it is badly carried out.—Yours faithfully,  
ASPIRANT.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, S.W.

SIR,—I have read with interest the letters you have received upon this important subject, and I notice that the professional seems to have swamped the artistic view of the matter. Allow me to put in a plea for the non-registration of architects. The great merit of the Bill is stated to be that it will create a higher status for the architect. Now, if we were to have registration, would that raise the architect in public estimation? I think not, while we have such abominations put forth every day by the men who have passed examinations of the Institute and Society of Architects. It is put forward that gradually we are progressing towards a higher appreciation of art, and that there is hope for the attainment of this by the registration of architects. This is a misapprehension. The men who are doing the best for Architecture, are not the men who have passed such examinations as the Society of Architects would offer. In the past there was no such passing of theoretical examinations. The architect was a man who had worked at "Arts and Crafts," had taken part in the actual building operations, and no one can surely deny that architects were held in far greater esteem then. Their buildings stand as witnesses of their skill. To my mind there is hope in the entry into the arena of persons unpossessed of a solely theoretical knowledge. In spite of all the examinations, there are many, members of the Institute, &c., who have passed these examinations who could not erect a satisfactory building were it not for the practical knowledge of the builder, and as for their designs, well, there is plenty of witness to my statement that they are a reproach to our state of civilisation. I welcome the influx of these "incompetent and unqualified persons," who will eventually revive the old craftsmanship spirit, and build for us beautiful buildings, practicably and workably planned, healthy, and safe.

Your correspondent, "Architect," calls for an "Architectural Union" for the protection of the interests of architects; rather call it a "Guild" and model it on the old lines, then should we obtain our recognition by the public and in law, and be able to guard against the cutting of fees. In your last issue Mr. Middleton states that the acquisition of a generally accepted minimum of knowledge and skill is no bar to genius. I quite agree with him in this, but everyone is not possessed of this genius, certainly not the majority of those who have passed these much talked of examinations. With regard to the "common

or garden kind" of architect, I consider it is wrong to force him to submit to an examination drawn up on the wrong lines, thus turning him upon the wrong metals, and wasting his time at that period of his life when it is most needed for the attainment of some practical skill and knowledge in the art of Architecture. If we had registration, those who had just managed to scrape through these examinations would, without doubt, be considered on much the same level as those who have a greater knowledge, for the generality of the public are unable to judge differently.—Yours, &c.,  
PRACTICAL.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### THE PRACTICE OF ENGINEERING.

To the Editor of THE BUILDERS' JOURNAL.  
DEVIZES.

SIR,—Will you kindly inform a constant reader whether a civil engineer has to pass any exam. before he can practice as an engineer. As you are aware, an architect has no exam. to pass to qualify him for practice, and I shall be glad to know through your columns whether this applies to civil engineering.—Yours faithfully,  
J. M. P.

Anyone is at liberty to call himself and to practise as an "engineer," and use the letters "C.E." after his name, but, of course, he cannot use the title of any of the engineering societies unless he is a member of them.

### CONCRETE MIXING.

To the Editor of THE BUILDERS' JOURNAL.  
ASTON.

DEAR SIR,—Would you kindly say what book you would recommend to a young starter, where there is a lot of concreting? Does mixing concrete at 6 to 1 mean 6 bushels of rubble, &c., to 1 bushel of cement and lime? What is the weight of a bag of ground lime, and how many bushels does it contain?—Yours, &c.,  
A BEGINNER.

Mixing concrete in the proportion of 6 to 1, means 6 parts—bushels or yards—of aggregate to 1 part of matrix. Aggregate for concrete foundations generally consists of broken bricks, stones, gravel, or similar hard and cheap materials; these are most readily obtained in the district of the proposed buildings. Aggregate for concrete paving, fireproof stairs, and similar works, consists of crushed granite, slag, used singly or in combination. Portland cement is the best matrix. Hydraulic lime is sometimes used for concrete foundations. One ton of quicklime = 27 bushels of ground lime; 3 bushels of ground lime = 1 sack; 9 sacks = 1 ton. "Plastering, Plain and Decorative," published by B. T. Batsford, 94, High Holborn, London, contains full instructions and illustrations concerning the use of concrete for all building purposes.  
W. MILLAR.

**Ilfracombe Improvements.**—Some time ago the Harbour and Pier authorities obtained an Act of Parliament sanctioning the construction of a breakwater, &c., at an estimated cost of £200,000. During the next twelve months it is intended to spend £17,000 upon a pavilion, and £10,000 upon dredging operations, and preliminaries in connection with the breakwater. The pavilion will be first opened on Easter Monday, next year, and will accommodate 2,000 persons. In connection with the pavilion will be a dining hall, refreshment rooms, cloak and dressing rooms, two lavatories, and a balcony right round the building forming a fine promenade. The breakwater will run out 60ft. from the present pier, and dredging operations are expected to deepen the water about 30ft. throughout.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
LONDON, W.C.

June 7th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkish carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### Picturesque Guildford.

It is a commonplace observation that we are apt to treat with much greater respect objects of interest and beauty that can only be seen with difficulty and expense than those which lie almost at our doors. Guildford is an example of a place, which, if it were located, say, in the Black Forest, would be much belauded by Baedeker and much visited by tourists. Mr. A. H. Powell, therefore, has done a useful piece of work in calling attention in the June number of the "Architectural Review" to the natural and architectural beauties of this interesting old Surrey town. Mr. Powell's article is illustrated by some charming sketches of his own, and we feel sure that after reading it many of our London readers, at any rate, will take the earliest opportunity of cycling or otherwise transporting themselves to Guildford, and making acquaintance, or renewing it as the case may be, with the Abbot's Hospital, St. Mary's Church, and perchance also the Angel Inn.

### An Excellent Number.

The article above referred to is but one of many good things in the current number of the "Architectural Review." The Academy Supplement given with this number contains twenty-three plates illustrating some of the most notable designs in Architecture and Crafts in this year's Academy; as not more than one design by any individual artist is given the collection is a very representative one. The editors seem to have succeeded in obtaining the right to reproduce practically all the most important designs, and there can be no doubt that the Supplement published last month, together with that in the present number, and a third supplement, which is announced for publication with the July number, will constitute the best and most complete record obtainable of the Academy architecture for 1899. Among other features of the June number are the concluding part of Mr. E. Guy Dawber's article on "Clocks and their Decoration," a second instalment of a well illustrated article on Toledo by Joseph Louis Powell, and an article in which all lovers of Nature will delight, entitled "Reminiscences of a Lincolnshire Stream," by R. B. Lodge. The ninth of Mr. F. L. Emanuel's series of plates illustrating "Disappearing London," which is given as a supplement with this number, consists of two small illustrations showing views of Milford Lane, Strand, and Booksellers' Row. We should not be surprised if these are regarded by many as quite the most charming drawings that have yet appeared in this series.

**Bricks as an Investment.**

THE "Financial News" published an article the other day in which the following reference was made to the present flourishing condition of the brick-making industry. "An examination of the accounts of the principal concerns suggests that the disinclination of shareholders to part with their shares is chiefly due to the lucrative nature of the business in which they have become interested, and to the handsome returns which are in many instances made in the way of dividend. The companies for the most part are moderately capitalised; but the dividend distributions in several cases are so considerable as to render it doubtful whether shares could be obtained anywhere in the neighbourhood of par."

**Tudor House.**

MR. HUGH BLAKISTON, the secretary of the National Trust for Places of Historic Interest or Natural Beauty, in a letter on the subject of the debate on Tudor House, Bromley, says that "by appointing a committee for the survey of the memorials of Greater London, the Council have admitted that architectural worth and historic interest are matters worthy of consideration. That such an admission should have been made by the greatest local governing body in the country is a precedent of great importance, and it would, therefore, be a great misfortune if, in the first case which came before them, the council were to ignore this admission. Further, the Parks Committee argue that the demolition of the house would provide more open space for the children to play in. The insinuation is, of course, that to preserve the house would be to postpone public utility to a mistaken aestheticism. Now are we, or are we not, to recognise that Art and History are not the hobbies of a few, but have a direct practical bearing on the lives of the people?" One of the most crying evils in the East End is the ghastly monotony which everywhere prevails, and although, as Mr. Blakiston remarks, beautiful surroundings are not a panacea for all ills, if the London County Council wish to make the lives of the people more healthy and more human, the preservation of such places of interest as Tudor House is one of the ways by which they can attain the desired end.

**Improvements in Aberdeen.**

AN arrangement was made some time ago between the Aberdeen Town Council and Mr. George Watt, architect, for the improvement and widening of a portion of Skene Square. A number of houses on the west side of the street are to be pulled down, and the new building line has been fixed so as to add 14ft. at one point to the width of the street. When this has been effected the west side of Skene Square will be one uniform line from Baker Street to Rosemount Place, with the exception of a small portion of open ground. Altogether six houses are to be demolished. One of the houses to come down is the birthplace of John Phillip, R.A., who was born there on April 19, 1817. His birthplace was suitably marked by a bronze tablet, and it is to be hoped that in any new building that may be put up care will be taken to mark in an appropriate manner the birthplace of the artist.

**The "Uglification" of Chelsea.**

A SHORT time ago attention was called to a very hideous shaft which the London County Council had erected on the Chelsea Embankment to ventilate the low-level sewer. The Chelsea Vestry, however, do not seem to appreciate its hideousness. Their artistic authority is Dr. Parkes, the Medical Officer of Health; he has examined the abomination, and at the last meeting of the Vestry reported as follows:—"The shafts are ornamental in appearance, with enlarged fluted bases and decorative tops, and do not, in my opinion, in any way detract from the beauty of the Embankment. A specimen one has been painted in three shades of green, which harmonises well just now with the surrounding foliage, and will, no doubt, have toned down to a somewhat more neutral tint with the

fall of the leaf." The italics are ours. Dr. Parkes admits that the ventilator at Battersea Bridge, not being screened by any neighbouring trees, and standing at a somewhat high level, is certainly a somewhat intrusive feature in the surrounding scenery, but it is difficult, he says, to see what other position could have been found for it. On the whole, however, he seems quite pleased with the proposed scheme, which, he says, "will be highly effective in preventing the nuisances which have been so long complained of, and will not in any way detract from the ornamental, architectural, or artistic features of the neighbourhood." We wonder whether the new councils will be more alive to the beauties of their neighbourhood than the present local authorities are.

**Fire Tests.**

THE British Fire Prevention Committee is showing further increased activity at its testing station, and a most important series of investigations is again in hand. Among these tests is one with a floor of steel joists and concrete filling, the concrete being of the aggregate lately allowed by the L.C.C. Another floor under investigation is one by the Columbian Fire-Proofing Company, U.S.A., which is to be subjected to very high temperatures. Various forms of doors of wood, armoured wood and iron will be under investigation, also silicate partitions and ceilings by Messrs. Anderson and Messrs. Broadbent; some patented partitions and plasters, some plain electro-glazed windows by the Luxfer Prism Syndicate; and lastly, some of the non-flammable materials. A set of ordinary partitions have also been recently tested. Nearly all the great public authorities are now represented at the committee's tests, and at the last test representatives attended from the leading insurance companies by special invitation. Owing to the numerous applications to visit the station, the executive has asked us to remind would-be visitors that the attendance is still strictly limited to the members by rotation, and a few special guests.

**The Consistory Court and St. Dunstan's.**

DR. TRISTRAM, Chancellor of the Diocese of London, sat last Wednesday to hear the application for a faculty to purchase the land next to St. Dunstan's Church. Mr. L. T. Dibdin appeared for the petitioners, and Mr. J. B. Aflay for the Law Life Assurance Society, and Mr. Hugh Blakiston for the National Trust for Places of Historic Interest of Natural Beauty. This latter's opposition was subsequently withdrawn. At the conclusion of the evidence the Chancellor reserved his formal judgment until next week, but said he should grant the faculty. We are very sorry that the considerable opposition which was raised to the hemming in with buildings on both sides of this fine tower was entirely withdrawn, so that the promoters of the scheme had it all their own way at the hearing of the application.

**Discoveries at the Tower of London.**

DURING the laying of the foundations of the new guard-room and other offices near the White Tower, the workmen cut through a Roman wall, probably belonging to the second century, beyond which were found a number of perfectly preserved flue-tiles, for the diffusion of hot air from the hypocaust. They are excellent specimens of their kind, measuring 15½ in. in length, 6½ in. wide, and 4½ in. in depth. Near by a Roman well has been uncovered, in good preservation, having a diameter of 4ft. 6 in. Several of the tiles are being found, and there is every probability that with such useful indications the Legion by which the constructions may have been carried out will be identified.

**Ancient Egyptian Building Materials.**

IN a recent issue of "Engineering" an article appeared on the architecture and chief building materials of the old Egyptians. It states that the chief building material of the old Egyptians was clay, dried, but not baked. The bricks

measured 5.5 in. by 14.9 in. by a minimum thickness of 4.3 in. Walls rose in step fashion. The sand-saw, made of wire, cord, or thin plates, and the bow were important tools. The enormous blocks of the statuary were first sawed in rough outlines with straight, or rather slightly curved, faces—the obelisk faces are all curved—and then worked down to proper shape. We cannot agree with the writer of the article that the workmanship of the architects of Egypt was poor. The workmanship of the Egyptians has always excited admiration, and certainly cannot be classed as poor. The writer says that the architecture cannot have descended from Nubia and the troglodytes; but the clay industry may have come from Chaldaea. The bricks of the Chaldeans, about 1ft. square, bore the Royal mark. It has been ascertained with practical certainty that they were chiefly used in the crude, soft condition. The Egyptians used mortar more like that employed in plaster than in ordinary masonry.

**The Tomb of Pelayo.**

THE Cathedral of Burgos are notable for their architecture and also for the tombs in them. The ornament which we here illustrate is in the Gothic Chapel of Santa Ana, and is on the sepulchre of Pelayus or Pelayo (date 1490), the conqueror of the Moors, at Cangas de Onis in the Asturias. By this battle of Cangas, Pelayo, who was the Cid of his time, gave the first serious blow to the Moors in Spain. The carving of the grapes and vine leaves is a good example of the free hand in sculpture possessed by Spanish artists. The vine was a favourite subject, being often combined with figures, birds and animals. Our illustration is drawn by Mr. Thomas R. Macquoid, R.I.

**A Portrait Exhibiton.**

ALL interested in portrait painting should make a point of attending an exhibition of the works of M. Benjamin Constant, which is to be opened in a few days at the Fine Art Society's galleries in New Bond Street. M. Constant is probably the most eminent of living French portrait painters, and he has lately received a commission for a portrait of Her Majesty the Queen. Among other works on view at the forthcoming exhibition will be portraits of Mlle. Emma Caloe, the Duchess Paul of Mecklenburg, Sir William Ingram, Bart., Madame Houssage, M. Paul Sohège, Comte Henri Delaborde, M. Chaplain, M. Bertrand, and others.

FROM THE TOMB OF PELAYO AT BURGOS CATHEDRAL. DRAWN BY THOMAS R. MACQUOID, R.I.

## Professional Practice.

**Bocking.**—A new church, erected in connection with the Franciscan Convent, was opened recently. The new building has been carried out in the Gothic style of architecture, with a belfry at the side, the materials used being red facing bricks with stone dressing, and windows of cathedral tinted glass. It comprises, in addition to the church, all the necessary accommodation for the nuns. The church is divided into three portions, the sanctuary, with the high altar, 20ft. by 25ft., the flooring being of stone and coloured tiles, and the front of the altar of glass mosaic. The reredos, of Hoptonwood marble and stone, is not yet completed. Facing the altar is the nave, 42ft. by 24ft.; this is fitted with oak stalls, the woodwork of which goes up and forms the gallery for the organ. At right angles with the sanctuary is the transept, 25ft. by 45ft., fitted with chairs for public use. The colouring of the ceiling of the church has been very artistically carried out, the sanctuary being blue, the chapel green, and the transept vermillion red, the combination of the colours having a very fine effect. At the rear of the church, the new portion of the convent forms a quadrangle with the old, around which are the refectory, kitchens, laundry, &c. The doors are panelled. Above the kitchens are ten cells or sleeping apartments for the nuns. The walls throughout are of grey plaster, and the floorings of wood. Mr. J. F. Bentley, of London, was the architect, and Messrs. A. Brown and Son, of Braintree, were the contractors.

**Mountsorrel.**—The enlarged chancel and vestry, new organ, reredos, choir stalls, and pulpit were dedicated recently at Christ Church by the Right Rev. Bishop Suffragan of Leicester. The chancel has been lengthened to 22ft. to accommodate the choir and organ. A simple but well-carved reredos has been erected at the east end. It has five panels, four for the Creed, Lord's Prayer, and Ten Commandments, and a centre having the symbolised vine and olive tree surmounted by the initials I.H.S. The organ consists of two manuals, great, swell, and full compass pedal organ. The manual action is on the Trackit system. The tubular pneumatic action is used for the pedal organ, and there are some interesting couplings in the stops. Mr. V. Dearden designed the combination, and Messrs. S. Taylors, of Leicester, were the builders. The oak choir stalls, executed by Mr. J. Dilks, of Mountsorrel, are nicely carved. The pulpit is of old oak of the church at Spondon, Derby. The contractors for the chancel, organ chamber, and reredos were Messrs. Scarr Jowell and Co., of Barrow, and the architects Messrs. Goddard and Co., of Leicester. The alterations will cost about £800.

**Portsmouth.**—A new drill hall is to be erected for the 3rd (Duke of Connaught's Own) V.B. Hampshire Regiment from plans prepared by Major A. H. Bone. The foundation stone was laid last Saturday. The frontage will be to Stanhope Road. The material will be dark red brick, with Portland stone dressings, and there will be a large square tower, with a miniature tower on it over the main entrance, castellated towers at the three angles, and a small circular tower at the Edinburgh Road corner. A further feature will be the large square bay to the officers' mess room, formed of Portland stone. The building consists of a large drill space, round which are grouped the various offices. The drill hall occupies the ground floor, its dimensions being 144ft. by 120ft.; the roof will be carried up by six wrought iron lattice principals; and there will be two galleries. To the right of the main entrance, and leading from the large hall, will be the gymnasium and recruits' hall. There will also be an extra hall and large gymnasium. The dimensions of the second hall are 60ft. by 46ft., and dressing rooms are attached. Over this portion of the building is the Officers' mess room and ante room. On the ground

floor to the left of the main entrance there are Commanding Officer's room, orderly room, armoury, men's recreation room, junior N.C.O.'s room, band room, and stores. On the first floor over the band room is the committee room; and another feature, the Sergeants' mess, 60ft. by 26ft., is over the N.C.O.'s room and part of the men's recreation room. Adjoining the Sergeants' mess is a room which will be set apart for the use of the Hampshire Yeomanry, and to accommodate large stores for the Quartermaster. The building will be mainly of two storeys, a third storey and a portion of the block being the caretaker's apartments.

**Reading.**—H.R.H. Prince Christian recently visited Reading for the purpose of unveiling the Murdock Memorial tablet in the pavilion erected on the Berks County Cricket Club ground at Elm Park. The memorial tablet is inserted 6ft. 6in. from the ground in the wall dividing the luncheon room from the members' dressing-room. It has been made from a richly-veined block of alabaster, and has a bold moulding, and the inscription, which states that the pavilion was completed as a memorial to the late Mr. Charles Townsend Murdock, the first chairman of the club, is incised in plain gilded block letters. The pavilion has been erected from designs by Mr. G. W. Webb, F.R.I.B.A., of Reading, and is a very commodious structure. It is in old English, half-timbered style, and of red brick, with ornamental brick patterns between the timbers, and surmounted by a bell turret, while in the central gable is a large clock. The roofing is in dark red tiles. The principal apartment of the building is the central luncheon room, which measures 40ft. by 20ft. The luncheon room is about 22ft. high, with open timbered roof, and four clerestory windows. On the left of the main entrance is the members' dressing-room, measuring 25ft. by 15ft., with adjoining separate bathroom lavatory, and other offices; while on the right of the luncheon room are a committee-room, about 15ft. square, a visitors' room, about 18ft. by 15ft., also with separate bathroom, lavatory, and offices, and a room and offices for professionals. Attached to the building on this side is a large covered stand, with terrace, which is reserved for the use of professionals. The floor of the pavilion is throughout raised some 5ft. from the level of the ground, and the terrace inclosure extends about 20ft. in front of the building. On the first floor the principal feature is the spacious balcony running along the front, and measuring 45ft. by 7ft.; this is approached by outside staircases. There is also a scorers' room, 14ft. by 16ft., with a balcony for the use of the scorers, and a large workshop and store room, 30ft. by 14ft., for the use of the ground men, each approached by a separate outside staircase.

**Roundthorn.**—Four foundation stones were laid recently on the site of the new chapel school to be erected at Roundthorn in connection with the Methodist New Connection Circuit. The style of architecture is Gothic, and it is to be built of brick, with stone and Ruabon dressings. The roof is to be open timbered to collar beam, and all the joiners' work will be of best pitch-pine and varnished. The access to the new school is by two entrances, from Roundthorn Road and from the old road, in which is a staircase leading to the gallery and to a corridor between the old and new schools, 6ft. wide, which gives access to both buildings. The large room is 52ft. by 34ft. 6in. There is a minister's vestry 14ft. 6in. by 12ft. The gallery over the main entrance is four sittings in depth. The outside facings to wall are to be of Newhey bricks. The glazing will be in ground sheet glass with lead lights above the transeam. The centre window in the front elevation is formed in a gable with buttresses on each side; this window will be all of stained glass in lead lights. The roof is to be covered with Welsh slates and Ruabon ridge cresting. The lighting of the school will be principally by ornamental coronas from the ceiling. The ventilation will be effected by fresh air wall inlets and outlets in the ceiling connected with patent exhaust ventilators on the roof. The

heating will be effected by hot water, low pressure. The total cost will be about £1,400, which includes lighting, heating, and ventilation. The schoolroom and the gallery will accommodate about 550 persons. The contracts have been let as follows:—Excavating, drainage, brickwork, and concreting, Mr. Whitworth Whittaker; stonework, Messrs. S. and J. Whitehead; joiner's work, Messrs. J. Hewkin and Co., of Greenfield; slating, Mr. R. C. Fletcher; plumbing, glazing, and varnishing, Messrs. Butterworth and Son; plastering, Mr. W. Lodge. The whole of the works are to be carried out from the designs and under the superintendence of Mr. John W. Firth, architect, of Oldham.

**Westbar.**—A new fire and police building is being erected for the Corporation of Sheffield on a corner site at the junction of Westbar and Westbar Green. The elevation is in the eighteenth century Renaissance style. Welsh bricks are being used for the facings, and Scotch stone is brought into requisition for the dressings. The tower rises to a height of 80ft.; the upper part is fitted as a look-out, and the lower is to be used for drying hose pipes. The police department is to the left of the tower, and consists of waiting, charge, telephone, and search rooms, inspector's office, four cells, parade in yard with glass roof over, and stable for twelve horses. The fire department, to the right of the tower, will have space for several engines and an escape, and stable for four horses, also a house for the superintendent. The whole of the upper floor is arranged as bedrooms, with lavatory and bathrooms, for twenty men, and the first floor has a kitchen, dining, and recreation rooms. White glazed bricks have been used for the walls of the fire engine house, police offices, and cells, and the floors will be of smooth surfaced concrete. The general contract is in the hands of Messrs. Ash, Son, and Biggin, of Furnival Street, Messrs. Charles Sedgwick and Sons have the slating and plastering, Messrs. Braithwaite and Co. the plumbing and glazing, Mr. Frank Tory the carving, Messrs. Bright Bros. the heating, the Gas Light Company is laying on the gas, and the building will also be fitted up with the electric light. The clerk of works is Mr. Walter Davison, and the architect, Mr. Joseph Norton, of Alliance Chambers Sheffield.

**Yarmouth.**—Last Wednesday afternoon the opening and dedicatory services took place in respect to St. Luke's Church, Cobholm. The building stands on a corner site in the principal thoroughfare at Cobholm, and has been built from plans prepared by Mr. Sidney Rivett, architect, of South Quay. It is in the simple Perpendicular Gothic style, and is built of red brick to the height of 6ft. 6in. from the ground line, and from thence is in half timbered work to the eaves, which are 13ft. from the floor line. The nave is 55ft. by 31ft. 6in. inside measurement. The chancel chamber is 11ft. 6in. by 11ft., the transept 11ft. by 11ft., and the chancel 23ft. by 17ft. The extreme height of the building is 28ft. The roof is of open timber work. The floor is of pitch pine blocks set on concrete, and the church is built on strong concrete foundations put in at considerable cost, on account of the marshy nature of the soil. The total building contract was for £930 and £52 for choir stall and other furniture. The church is seated to hold about 300 persons. The following were the various contractors:—Mr. A. E. Bonbrickwork and masonry; Mr. A. J. Willimon carpentry, &c.; Mr. W. T. Spencer, plumbin and painting; Mr. W. R. Weyer, of Norwich coloured glazing.

**The Coalbrookdale Company, Limited.**—The premises of this company at 1, Victor Embankment have become too small for the requirements, owing to the growth of their business in London, and they have been compelled to move into larger and more convenient show-rooms at 141, Queen Victoria Street, London, E.C.; the entrance for goods is at 231, Upper Thames Street, E.C.

## Keystones.

**Mr. John Smart, R.S.A.**, a well known painter of Highland landscapes, died at his residence in Edinburgh last Thursday.

**Woodford Diamond Jubilee Hospital** was declared open last Thursday by the Duke of Connaught. Mr. Kingwell Cole and Mr. Kenneth Wood were the architects.

**The Chancel of Holy Trinity Church, Aberystwyth**, was opened last Wednesday. The cost of the erection of the chancel, together with choir stalls, has been £3,000.

**Some of the bronzes ordered by Mr. Rhodes** to adorn the monument over the grave of Allan Wilson's patrol are on view at Earl's Court. They are the work of Mr. Tweed, the Scotch sculptor.

**The New Offices** of the Wandsworth and Clapham Board of Guardians are to be erected according to the designs of Mr. Cecil A. Sharpe, A.R.I.B.A., of 59, Fenchurch Street, London, E.C.

**Mr. Abraham Graham** has just died at the age of sixty-six years. The deceased was the head of the firm of contractors, Messrs. Abraham Graham and Sons, whose business is carried on at Longroyd Bridge.

**The Bury Fire Brigade's New Station** was opened last Wednesday. It is situated on the south side of the School of Art. The station proper measures 35ft. by 20ft. Adjacent is an orderly room, 14ft. by 17ft.

**An Altar Table** of oak has been placed in St. Andrew's Church, Lincoln. The work was carried out by Mr. S. C. Basker, the carving having been executed by Mr. A. J. Tuttell. The architect was Mr. Pratt, of Nottingham.

**A New Church at Denaby**, the foundation stone of which was laid last week, will cost about £3,500, and will accommodate 500 persons. The building will be of local stone, with pitch pine roof and red tiles. Mr. Fowler, Durham, is the architect.

**The Primitive Methodist Chapel at Loddon**, when completed, will seat about 200 persons. It will cost close upon £1,000, and is being erected by Messrs. Chaston and Grimson, of Loddon, Norfolk, from plans by Messrs. Kerridge and Sons, of Wisbech.

**The Foundation Stones** of the New Wesleyan Sunday School at Sileby, Leicestershire, have just been laid. The building, which is being erected by Mr. Sleath, of Rothley, from the plans of Mr. A. E. Sawday, of Leicester, is to seat 400 persons. The material used for the exterior work will be chiefly local bricks.

**A New Church**, to be known as the Church of St. Simon, has been erected in Saltram, Somerset, Paddington. The church, of which the chancel remains to be erected, is a handsome building of red brick and Bath stone dressings. The cost so far has been £4,500, but £2,000 more will be necessary to complete the original designs of the choir and chancel.

**A Bridge over the River Spey**, at Boat Garten, has been erected to take the place of the chain boat, which has hitherto connected the Duthil and Kincardine sides of the river. The bridge, which has a span of 350ft., is of timber, with stone piers and abutments, as designed by Mr. A. Mackenzie, of Kinrossie, and the contractor was Mr. Charles Mackay, of Inverness, the sub-contractor for the mason work being Mr. A. Macpherson, of Newtonmore.

**A Proposal to Keep the Sea on Southend** has been submitted to the Southend Town Council by a London capitalist, who is willing to construct a huge sluice sea wall at a cost of not less than £600,000. The only privilege the promoter seeks is that he shall be allowed to erect extensive generating plant, and use the tidal force for its working, with the idea of supplying the metropolis with electric motive power. The proposer is willing to guarantee that there shall never be less than 3ft. 6in. of water upon any part of the beach, which now remains uncovered for twelve hours out of every twenty-four.

**Aberdeen's New Fire Station**, in King Street, has been erected at a cost of £12,000. It is built of Kemnay granite, the walls rising to a height of about 52ft. A tower 100ft. high is attached to the building.

**A New Town Hall for Oldham** is wanted, and the Corporation have decided to obtain the advice of Mr. A. Waterhouse, F.R.I.B.A., upon the matter. The cost is roughly estimated at £100,000.

**St. Mary's Church, Waterloo Park, Liverpool**, is to be completed by the extension of the church three bays to the west. This will give a further accommodation of 250 sittings, bringing the total up to 800 sittings. The estimated cost is £3,000.

**A Suspension Bridge** is to be erected at Calais at a cost of about £70,000 in order to provide a direct connection between the town and the fine stretch of sands there. It is to be commenced at once. Tenders have been invited from French, English, and American firms.

**The Decoration and Repair of St. James' Church**, Hampstead Road, London, N.W., has been carried out by Messrs. Percy Bacon and Bros. The sanctuary floor has been raised and laid with wooden blocks; the walls have been panelled with carved oak, and a baldachino has been erected over the altar, with paintings of two censing angels above. Outside the church a wrought-iron structure of artistic design has been erected.

**Heckingham Church** has been opened after restoration. The building, which is dedicated to St. Gregory, is an ancient structure of the Norman period. The restoration has taken the form of a thorough renovation of the interior of the church. The old box pews have been replaced by substantial oak benches, new floors laid throughout, and the walls re-coloured. The interior of the roof of the nave has been covered with stained deal, and the exterior, which is of thatch, repaired where necessary. An entirely new roof has been placed over the north aisle. The chancel has been restored, and a new vestry has been provided by the erection of a panelled screen at the west end of the north aisle. The pulpit has also been remodelled. The work of restoration has been carried out by Mr. R. Morriss, of Ditchingham.

**Restoration of St. Edith's, Anwick, Lincolnshire.**—Archæologists will be glad to hear that the greater part of the outer arch and the tracery of the original chancel window heads have been found in the foundations. It will be remembered that the chancel was mutilated by pulling down the eastern bay and reducing the height; and it was during the excavation for the restoration of this bay that this interesting discovery was made. The priest in charge, the Rev. A. H. Staffurth, will be glad to show anyone with archaeological tastes over the church. The plans for the restoration have been drawn by Messrs. Brewell and Baily, Nottingham and Newark, so we feel sure all features of historical interest will be considered, and the old tracery built into the new bay. An appeal is being made for contributions towards the £150 required to complete the chancel.

**The Plans for the Restoration of Paisley Abbey** have been approved of by the Executive Committee. The architect, Dr. R. Rowand Anderson, has arranged for the work to be done in sections, so as to interfere as little as possible with the public worship in the church. The first portion to be undertaken will be the restoration of the transepts and the four great arches of the centre tower, and then will follow the rebuilding of the choir, the foundation and lower walls of which are still intact. The final portion of the work will be the completion of the tower. Some contention has taken place as to whether it was a tower or a spire which adorned the abbey in olden times, but the architect states that the probabilities point to its having been a tower only, finished with a cape and saddle-back, as in the Dundrennan, Sweetheart, and other abbeys. The total cost of the restoration will be about £40,000.

## Under Discussion.

### TRADE UNIONISM.

The subject for discussion at a meeting of the Toynbee Hall Economic Club on Tuesday evening last week, was "The Future of Trade Unionism." The debate was opened by Mr. Francis E. Douglas, who considered the possibility of forming a national federation of trade unions. He believed that the future would see the launching of some great federal scheme, but such a federation should not be looked upon as a menace to trade, but as a safeguard of the interests of the workers and of their future advancement. Some of the schemes which had been put forward might be justly looked upon by employers with suspicion, and any scheme that was a standing menace was not likely to be of advantage either to employers or employed. The scheme put forward last year at the Manchester conference began at the wrong end. Before there could be a comprehensive measure, there must be sectional federation, and the structure must be built up from the bottom and not from the top. The only way to obtain permanent cohesion was by a community of interests, and the federation of kindred trades presented least difficulty. Were such sectional federations first launched, it would be easy to combine them into a national organisation. Mr. R. Bell, secretary of the Amalgamated Society of Railway Servants, fully agreed that there must be federations of kindred trades before there could be a federation of the whole, but instanced the difficulties that had prevented the union of the three organisations of railway men as typical of what might be expected in other trades.

## New Companies.

### Artillery Mansions, Limited.

Messrs. Godden and Co., of 34, Old Jewry, London, E.C., registered this company on May 10th, with a capital of £100,000 in £5 shares. Its object is to acquire, complete, and furnish the hereditaments and premises known as Artillery Mansions, Victoria Street, Westminster, and the land belonging thereto, and for that purpose to adopt and carry into effect an agreement to be made between J. C. Wood of the one part and this company of the other part; to build and maintain maisonettes, flats, or suites; to lay out pleasure grounds, gardens, &c.; to erect kiosks and conservatories; as wine and spirit merchants, hotel keepers, boarding and lodging-house keepers, ice manufacturers. The first subscribers (each one share) are: J. C. Wood, W. Rolfe, J. H. Randall, J. E. C. Wood, W. Godden, J. Calder, and E. Crutchloe. The first directors—of whom there shall be not less than three nor more than six—are W. Rolfe, J. C. Wood, J. E. C. Wood, and J. H. Randall. Qualification, £100. Remuneration, £300 per annum, divisible.

### Carl Hentschel, Limited.

This company has been formed to acquire, and to extend and carry on, the business of photo engravers, designers, electrotypers, and stereotypers carried on by Carl Hentschel and Co., of London, Manchester, and Liverpool. The share capital is £60,000, divided into 39,500 six per cent. cumulative preference shares, and 20,500 ordinary shares of £1 each. The company also acquires half-interest in the Studio of Design, Limited, Effingham House, Arundel Street, London, W.C., the other half being held by Mr. Harry Furniss. The company acquires half the ordinary share capital of the Carl Hentschel Colortype Co., Limited, which was formed at the commencement of this year to work a new colour process, and which owns freehold premises at West Norwood, fitted up with plant and machinery. The purchase price for the businesses has been fixed by the vendors at the sum of £48,000, payable as to £20,500 in ordinary shares issued as fully paid,

and as to the balance, £10,000 in preference shares and £17,500 in cash or preference shares, at the option of the company. Subscriptions are now invited for 29,500 preference shares. The company was registered on May 24th by Martin and Co., of 29, Queen Street, London, E.C. The first directors—of whom there shall be not less than two nor more than seven—are Carl Hentschel, C. Akers and J. Grego. Qualification, £1,000. Remuneration to be fixed by the company.

#### George Freeman, Limited.

This company was registered on May 19th, by H. W. Watkins, of 11, Queen Victoria Street, E.C., with a capital of £50,000 in 49,000 ordinary and 1,000 "B" shares of £1 each. The object of the company is to acquire the business carried on as George Freeman at Gordon House, Frederick Place, Brighton, and at Conway Street, Hove, and to adopt an agreement with F. W. Freeman, and to deal in builders' and contractors' materials, cement, stone, marble, sand, lime, bricks, tiles, terracotta, &c.; to acquire and turn to account any real or personal property, patents, patent rights, and inventions; to construct and maintain rail and tram roads; to carry on the business of a mining and trading company in all its branches; to lay out towns and villages, &c.; to construct gas works, &c., rail and tram roads, &c.; as stock raisers, farmers, and graziers, &c.; stock and share dealers, bankers, and financiers; to undertake and carry out all kinds of agency, guarantee, and trust business. The first subscribers (each one share) are: Mr. and Mrs. T. W. Freeman, Mr. and Mrs. J. G. Williamson, and Messrs. E. Wilson, P. R. Jackson, and W. O. Williamson. The number of directors is to be not less than two nor more than five; the first are F. W. Freeman (chairman and managing director) and J. G. Williamson. Qualifications, £500. Remuneration as fixed by the company.

#### Hedingham Brick Company, Limited.

This company was registered on May 29th, by E. S. Beard, Headgate, Colchester, with a capital of £25,000 in £1 shares. Its object is to acquire and carry on the business of a brick, tile, and drain pipe manufacturer carried on by E. West as the Purls Hill Brick Company at Great Maplestead and Sible Hedingham, both in Essex. The first directors—to number not less than three nor more than five—are E. S. Beard, G. Comer, and W. H. King. Qualification, £100. Registered office: Headgate, Colchester.

#### Midland Brick Company (Wellingborough), Limited.

This company was registered on May 25th by Jordan and Sons, Limited, of 120, Chancery Lane, London, W.C., with a capital of £15,000 in £10 shares, to acquire from G. Hensen certain lands at Wellingborough, Northants, and to manufacture and deal in bricks, tiles, earthenware, fireclay, &c. Registered office, 29, Church Street, Wellingborough, Northants.

# CANADIAN NOTES.

## II.—THE PORTLAND CEMENT INDUSTRY IN AMERICA.

By J. RAWSON GARDINER, of Montreal.

IN the article under this heading which appeared last week, mention was made of the manner in which the American manufacturer was forcing his goods into the market. Let us take Portland cement, and see what is being done on the American continent in regard to this article, which is of so much importance to both engineer and architect.

The market for Portland cement in the United States has been growing very steadily, and at the same time has been undergoing a great change, as will be seen by the following figures:—

Portland cement made in United States	1891 barrels.	1894 barrels.	1897 barrels.
States	455,000	798,000	2,678,000
Imported	2,783,000	2,638,000	2,090,000
	3,243,000	3,436,000	4,768,000

These figures show that while the imports have been decreasing slightly the amount produced in the United States has been increasing very rapidly, until in 1897 the home-made article exceeded the imported. Of these 2,678,000 barrels 75 per cent. were manufactured in the Lehigh valley district by some five or six manufactories. Of the 2,090,000 barrels imported, Germany has nearly 50 per cent. to her credit, England and Belgium about equal quantities, and France completes the list.

These five or six American manufacturers have been improving the quality of their cement, so that at the present time they are trying to compete against well-known German brands, such as the "Dykerhoff," "Germania," and "Mannheimer" brands. It was to the German that the American turned for his methods of manufacture, as it was the German who held the palm for high-grade cements. This point of recent years is rarely disputed, although now the American manufacturer is claiming that his cement is at least equal to the German standard.

English cement seems to be gradually but surely growing in disfavour in the American market, whereas, ten years ago, English cement held the place taken now by the German article.

This, no doubt, has been caused, to a large extent, by the newer works and machinery used by the Germans, which are turning out a finer and more uniform product than that turned out by the majority of English firms. The kilns used by the Germans are usually "continuous," on somewhat the same principle as the well-known "Hoffman" brick kiln; whereas, the English, and formerly nearly all American firms, used a modified lime kiln.

To show somewhat the feeling in the United States in respect to German versus English cements, let us take the following quotation from a well-known American architectural paper:

"The principal reason the English manufacturers lost their grip on this market was due to the question of fineness. Until quite recently they stubbornly refused to meet the importers' demand and furnish a hard-burned cement, ground fine enough to meet the requirements of the engineering profession in this country. To the German manufacturers is due the credit of educating this country (the United States) up to requiring a finely ground cement, but it must be said to the credit of the American Portland cement manufacturers that they have been prompt in meeting this issue."

Now let us compare some tests made for the Engineering Commission of the District of Columbia, which shows—

Average of 6 German cements	Passed a No. 100 sieve.
" 5 American "	92.8 per cent.
" 2 English "	93.1 "
	83.0 "

Or again some tests made by the Survey Department of Philadelphia in 1893.

	GERMAN.	Passed No. 50 sieve.
"Dykerhoff" .....	...	99.52 per cent.
"Germania" .....	...	100.00 "
"Mannheimer" .....	...	99.42 "
	ENGLISH.	
"Brooks Shoobridge Co." .....	...	96.25 "
"Burham" .....	...	95.58 "
"Gostling" .....	...	94.00 "
	AMERICAN.	
"Saylor's" .....	...	100.00 "
"Whitakers" .....	...	99.80 "
"Egypt" .....	...	99.21 "
	BELGIUM.	
"Dagger" .....	...	99.25 "
"Bell" .....	...	98.13 "

These quotations and tests show fairly well how English cement is looked upon by the American engineer when compared with high grade German, and, of latter years, the best American grades. American Portland cement is no doubt going ahead, as they have splendid raw material and the ingenuity to turn the knowledge acquired by the German to suit their needs. The rapidity with which it has pushed itself to the fore in the last four years is phenomenal. Here are two tests taken from the "Whitaker" deposit and the "Glen Falls" deposit:—

	"Whitaker."	"Glen Falls."
Silica .....	14.44	21.50
Carb. Lime .....	75.17	63.50
Alumina, Sesquioxide of Iron .....	5.91	10.50
Magnesia .....	.77	1.80

In both cases the deposit is very uniform, with hardly any perceptible change in the analysis, and both lists show a very high percentage of lime.

In respect to Canada, the following returns give a fairly good idea of the Portland cement market:—

	1892.	1894.	1896.
Great Britain .....	216,000	190,000	134,000
Germany .....	11,000	2,000	15,000
Belgium .....	22,000	60,000	79,000
United States .....	23,000	33,000	22,000
France .....	2,000	4,000	11,000

The above figures show that English cement holds the Canadian market, although even here the amount is on the decrease. There are some four or five manufacturers in Canada, the most prominent being in Ontario. The industry shows signs of turning out a high grade of cement, and usually passes a very good test for fineness and also for strength. The following is a clipping from a Montreal paper of March, 1899: "We quote spot prices, ex store, as follows: English brands, 2dols. 35cents, to 2dols. 45cents; German, 2dols. 50cents, to 2dols. 60cents; and Belgian, 1dol. 90cents, to 2dols. 10cents."

Of the countries in South America importing cement the chief are Brazil, Chili, and Venezuela. Brazil imports from Germany alone some 200,000 barrels, while Chili imports about 70,000 barrels.

The above notes will give those interested in the Portland cement industry some idea of "things as they are" on this side of the Atlantic, and they will be able to draw their own deductions therefrom.

**The Bradford Rural District Council** held a meeting last week, at which a letter from the Local Government Board, inclosing formal sanction to the borrowing of £1,760 for works of water supply for the parish of Gotham, was read. The sanction was given conditionally that all the pipes be laid with a covering of at least three feet, measuring from the top of the pipe to the surface of the ground.

**Street-Paving at Goole.**—An inquiry was held at Goole last week by a Local Government Board Inspector, respecting the application of the Goole Urban District Council to borrow £10,700 for purposes of wood and granite road making. It was stated that the Council had decided that wood paving and granite would be better than either tar macadam or plain macadamised road. The streets to be paved are Market Square, Boothferry Road, Dutch River Bridge, Bridge Street, and Marmers Street.

# THE FAWCETT FIRE-RESISTING CONSTRUCTION.

THE destruction of life and property by fire is one of those calamities which we look forward to with dread, combined with an amount of expectancy savouring almost of fatalism; yet the safeguarding of our dwellings, business premises, and public buildings, by the adoption of some system of fire-resisting construction is a matter in which progress is very slow. One of our national characteristics being extreme conservatism and cautiousness, we oftentimes seem to lag behind in the march of progress, especially when keeping abreast of it implies the adoption of something which savours of being new-fangled, untried, or unproved. But if we move slowly perhaps we move none the less surely, and when we find the Government somewhat extensively adopting for all their new and important buildings a patented system of fire-resisting construction, the obvious inference is that that special system has points of merit which raise it above the level of mediocrity.

In all systems of fireproof construction iron or steel is largely employed; but, as is well known, when subjected to high temperatures both become so weakened as to be unable to overcome the strain and stress of the load they bear, and, consequently, collapse. Any system, therefore, which affords thorough protection to the supporting girders and joists, at once gives an additional and a very high factor of safety. Fawcett's system fully accomplishes this by not only entirely casing all steel, but also by providing continuous ventilation throughout the floor, wall, or ceiling.

These protective casings (see Fig. 1), are technically termed "lintels;" they are made of red chimney-pot earth, and are hollow from end to end. Each end is notched to fit over the lower flanges of the joists, and the abutting ends of adjacent bays of lintels form an air space from end to end beneath the flange of each joist (see Fig. 2, which is a longitudinal section through the centre of abutting bays of lintels), so that a Fawcett floor is thoroughly ventilated in both directions. Another feature of this system, as will be seen by reference to Fig. 3—a cross section through the lintels—is that a perfectly flat ceiling is obtained, the underside of each lintel being flat and being provided with longitudinal dovetail grooves to afford a key for the plastering. The steel framework having been laid, with the joists arranged 2ft. from centre to centre, the lintels (previously sorted to exact length) are rapidly slid into position, the diagonal method employed for fixing them facilitating this operation, and also allowing of very close jointing. Lintels and steel framework are then covered in with concrete, composed of the ash and clinker from steam boilers, passed through a riddle and mixed with Portland cement. This mixture provides another fireproofing element, as the concrete contains nothing that is in any way combustible, and at the same time it possesses all the good qualities of breeze concrete by affording a very secure fixing to whatever is nailed to it; and whilst it is harder than the latter material, it is just as readily cut away when necessary.

The system referred to is that invented in the year 1888 by Mr. Mark Fawcett (Mark Fawcett and Co., 50, Queen Anne's Gate, Westminster), its initial adoption into Government work being in connection with the National Portrait Gallery in 1891, since when it has also been introduced into the Houses of Parliament, Buckingham Palace, Marlborough House, South Kensington Museum, the Public Record Office, the General Post Office, the Patent Office, the Royal Mint, the New Admiralty Buildings, and other Government buildings. In addition to this extensive official use, the system has been adopted in upwards of 2000 other buildings of all descriptions in the United Kingdom and in the U.S.A.

Now for the "proof of the pudding." Messrs. Fawcett claim that no building in which their system has been adopted, and in which a fire has occurred, has been destroyed or seriously

FIG. 1.

FIG. 2.

FIG. 3.

damaged. The report of a test by the building department of the City of New York is also instructive. A room 11ft. by 14ft. by 10ft. high, with walls 12in. thick of common brick in mortar, was covered with a "Fawcett" floor loaded to 150lb. per square foot over the whole area. A fire was started at 9.33 a.m., and continued until 12.16 p.m.—the heat reaching as high as 2200 deg. F.—when a stream of water at 60lb. pressure was turned on for fourteen minutes. The report terminates: "At no time did the fire penetrate through the floor, nor did the fire stream cut through at any point."

Recently, by invitation, we had the pleasure of inspecting Block II. of the new Admiralty Buildings, now approaching completion at Spring Gardens, Charing Cross. This block of buildings—to all intents and purposes a replica of Block I. (commenced in 1892, and now in use)—offers plenty of scope for the display of constructive ingenuity in adapting a fire-proofing system to particular needs. Owing to the natural characteristics of the site—the name suggesting the presence of water—the floor of the basement is hollow, and in construction is treated precisely as all the other floors of the building. Except for the brickwork shell the whole block is practically—to coin a word—"Fawcettized" throughout, not only the floor, but the roof and nearly all the partition walls being fire-proofed on the Fawcett system. Of the adaptability of the "boiler-ash" concrete to fixing purposes we found ample evidence; the Westmoreland Green slating on the front sloping portion of the roof is nailed direct to it, as also are the rolls for the lead on the inner almost flat portion; the metal also is dressed to it without any preparation. The plumbers, too, seemed to have discovered the advantage of being able to secure their tanks without the intervention of plugs and blocks, the presence of the latter being so noticeable where piping had to be carried across and secured to the face of brickwork. Fig. 4 is a photographic reproduction of a portion of the Admiralty Buildings, showing the work in progress of fixing the lintels and filling in over them with concrete.

"Good wine needs no bush," and, possibly, Fawcett's system of fire-resisting construction may stand in no need of laudation by us; still, we have pleasure in introducing to the notice of our readers something which, evidently, has merits above the average.

## THE DISPUTE IN THE BUILDING TRADES.

### TERMS OF SETTLEMENT.

THE dispute was satisfactorily settled at the meeting, on May 30th, between the representatives of the two associations, and the men are to resume work on or about June 12th, on terms which seem to meet the wishes of both parties. In considering the conditions of the settlement, the masters were certainly ungrudging in their concessions. Many would have held them justified in holding out much longer against some of the demands made of them, but they probably felt that the sooner such an unpleasant matter ended the better, and therefore met the men in a very friendly spirit.

At the meeting, which took place at the Salisbury Hotel, Fleet Street, E.C., under the chairmanship of the editor of the "Daily News," Mr. E. T. Cook, the following gentlemen represented the National Association of Master Builders:—Alderman Holdsworth, president; Mr. B. I. Greenwood, London; Mr. C. W. Green, Liverpool; Mr. Geo. Nichols,

Leicester; Mr. James Higson, Manchester; and Mr. J. W. Sugden, president of the National Master Plasterers' Association, Bradford. The representatives of the Operative Plasterers were Mr. Mark Jones, president; Mr. M. Deller, secretary; Mr. Dan Hennessy, London; Mr. A. McLeon, Newcastle-on-Tyne; Mr. Geo. Jackson, Manchester; and Mr. Henry Duckett, Birmingham. There were also present Mr. J. A. Hassal, Secretary of the National Association of Master Builders, and Mr. Clement Edwards.

The questions concerning compelling foremen to join the Union, boycotting and black-listing, demarcation, and refusal by the men to work on buildings where some of the workmen employed may not belong to a trade union have been settled according to the basis stated in our issue of last week. It was agreed that the question of the limitation of apprentices should be referred to a special Joint Committee of both sides to draw up working rules to govern the matter. The conference was of opinion that the difficulty with regard to the proportion of apprentices could be best solved by every apprentice being legally bound. At the conclusion of the conference, the Joint Committee of the two associations, which was appointed to deal with the apprenticeship question, came to a decision on two of the points under this heading. It was agreed that no employer should engage any additional apprentices whilst the number of his apprentices exceeded one-fourth of the number of journeymen plasterers then employed by him. It was also decided that all apprentices should be legally bound, but as the delegates could not agree upon the age at which apprentices should begin work, the matter is to be further discussed at a subsequent meeting of the committee. The employers maintained the right to apprentice boys at any age, but the operatives insisted that a boy should not be bound above the age of sixteen years. It was provisionally agreed that the lock-out order should be withdrawn on June 12th.

At York last Thursday the 75 per cent. of the bricklayers who had not been locked-out by the suggestion of the Yorkshire Federation took the matter into their own hands and struck work. On the same day the lock-out of 25 per cent. of the union men in the building trades in Scarborough became effective; this step affects about sixty men.

**Surveyors' Institution.**—At the annual meeting of the Surveyors' Institution last week Mr. T. M. Rickman was appointed the President for the ensuing year. Mr. Gate gained the Institution Prize, Mr. Arthur George Bradshaw the Special Prize of Ten Guineas, Mr. Geo. Freeman the Penfold Silver Medal and the Driver Prize, Mr. Sidney Arthur Smith the Penfold Gold Medal, Mr. Bowden the Crawler Prize, and Mr. A. Neate the Students' Prize.

FIG. 4.

## Masters and Men.

**Paisley Labourers** have gained the advance from 5½d. to 6d. per hour for which they struck work.

**The Chester Bricklayers' Labourers** to the number of about 150 have struck for an advance of wages from 5½d. to 6d.

**Edinburgh and Leith Joiners' Strike.**—Thirty-three masters, employing about 380 men, have accepted the men's terms.

**The Masters who have conceded** to the men's demands in connection with the Edinburgh plumbers' strike now number fifty-three.

**The Strike in Sunderland** of builders' labourers has resulted in the men accepting 6½d. per hour, and time and a quarter for overtime.

**Bolton Stonemasons** went on strike last Wednesday for an increase of ½d. per hour and an alteration in the apprentice and overtime rules.

**The Joiners at Fleetwood** have struck for an advance of ½d. per hour, which will bring their wage up to 8½d. About 150 men came out last Thursday.

**Arbroath Masons** have gone on strike for an increase of wages from 8d. to 8½d. per hour. At a mass meeting it was stated that Mr. Adamson, the contractor for the new post office, had signed the by-laws, and the whole of his men have remained at work.

**The Lock-out in Denmark** still continues. The employers of Christiania, Malmö, and Gothenburg, according to telegrams received from those places, have decided not to give employment to those who are out of work owing to the lock-out in Denmark.

**Strike at Lowestoft.**—Between 200 and 300 carpenters, joiners, bricklayers, and labourers went on strike last Wednesday. The men demanded 1½d. per hour advance for artisans, but the masters would only agree to ½d. advance. Another point in dispute is that the men desire that overtime shall commence at the conclusion of the "ordinary" day's work, but the masters demand that it shall not commence until 7 p.m. Two firms in Lowestoft are paying the sum demanded, viz., 7½d. per hour.

**Newport Building Trade.**—In answer to an inquiry made by the secretary of the National Building Trades' Federation, the secretary of the Master Builders' Association states that the latter are offering employment at the following wages: 8d. per hour until December 1st, 1899, when the figure will be 8½d. per hour, and there will be a new code of rules. Labourers will receive 5½d. on the same date. The bricklayers alone have accepted these terms. The Newport Master Builders' Association have established an office to receive applications from men for employment.

**Labour Disputes in Germany.**—A Bill has been submitted to the Reichstag for the protection of the position of workmen in industries. The measure visits the use of physical force, threats, defamation, or boycott in labour questions with imprisonment not exceeding one year, or, in case of extenuating circumstances, a fine not exceeding 1,000 marks. Should, in consequence of the unyielding disposition of the parties approached, a strike or lock-out have been forcibly brought about, or should, from the same cause, the security of the empire or of a federal state have been jeopardised, or life and property have become endangered, the penalty shall be hard labour not exceeding three years, except in the case of the ringleaders, for whom the maximum penalty shall be five years.

## Engineering Notes.

**The New Board Schools, Llanelly,** have been fitted with the latest improved hot water heating apparatus by John King Limited, engineers, Liverpool.

**Railway Extension in Donegal.**—Mr. Gerard Balfour, accompanied by Lady Betty Balfour, visited Cardonagh, co. Donegal, on May 23rd, for the purpose of cutting the first sod of a new railway to be constructed between Cardonagh and Buncrava, which will open up the populous peninsular of Inishowen.

**Liverpool to Manchester in Twenty Minutes.**—The joint committee of Liverpool and Manchester representatives, who have been considering the scheme by Mr. Behr for establishing an electric express railway on the mono-rail principal between Liverpool and Manchester, have reported favourably. A meeting of the committee was held last Wednesday, at which a resolution was adopted setting forth that some such scheme would be of public advantage. The estimated cost of construction is £1,500,000.

## Builders' Notes.

**The Acomb Board Schools, York,** are being warmed and ventilated by means of Shorland's patent Manchester grates and patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**A Mechanical Bricklayer.**—A consulting engineer of Birmingham, and his son, have just secured British and international protection under the Patent Acts for an invention entitled "a mechanical bricklayer," for use in automatically laying, cementing, and levelling bricks, slabs, stones, and the like, in buildings of every description. The inventors expect to save two thirds of the time occupied in laying bricks by hand.

**A Recipe for Mortar used in Leeds.**—The Building Clauses Committee of the Leeds Corporation, at a recent meeting, passed a resolution requiring that in future all mortar used for buildings in Leeds shall consist of not less than one part of lime to two parts of good engine ashes, or clean river sand. This resolution was the outcome of a report presented by Mr. Fairlie, the city analyst, showing that many samples recently analysed fell far below this standard. As a result of the action of the committee the building inspectors of the Corporation will have power to take samples of any mortar being used for building purposes, and have them submitted for analysis.

**Building Offences at Ossett.**—At the Ossett Borough Court, on May 29th. Mr. John Cooper and Mr. Moses Ellis, builder, were summoned for erecting a dwelling-house without leaving sufficient space at the rear as required by the by-laws. An undertaking was given by the defendant to acquire the necessary land, and the adjoining owner, Mr. Percival Terry, expressed his willingness to sell it to him. Upon this understanding the Bench only inflicted a penalty of 5s. and costs upon the builder, and 10s. and costs upon the owner, with a further continuing penalty of 1s. per day, which was not to be enforced if the requirements of the by-laws were complied with in two months. The case against Mr. William Broadhead for converting a building formerly used as the Gawthorpe Liberal Club into two dwelling-houses without submitting plans to the Corporation, was dismissed. Mr. William Wilcock, rag merchant, and Mr. James Hemingway, builder, were summoned for erecting an engine and boiler house for the former without submitting plans to the Corporation. The Bench fined the owner 5s., and the builder 2s. 6d.

## Surveying and Sanitary Notes.

**Bacterial Treatment of Sewage.**—The Sewage Committee of the Blackburn Corporation have recommended the bacterial treatment of sewage by Dibdin's process. They recommend the laying down of five acres of bacteria beds at a cost of £21,000, and estimate that an actual saving can be effected on the method now in use. Experimental bacteria beds have been in use at the Samlesbury Sewage Works for twelve months, with satisfactory results.

**The Disposal of Bingley Sewage,** at a cost of £26,000, formed the subject of a Local Government Board inquiry last Wednesday. The District Council sought power to borrow the amount for the purpose of completing the disposal works and laying the necessary main sewers for the conveyance of the sewage from the whole of the district around Bingley, including Wilden and the Harden Valley. The cost of these sewers was estimated at £8,040, the extension and completion of the works at £10,487, land and easements at £4,001, engineers' costs, law costs, &c., at £1,350, and contingencies at £2,121.

**Sanction has been refused** by the Local Government Board to the Barnsley Rural District Council's application to borrow £6,500 for a sewage scheme at Cudworth. Objection was taken to the site for the outfall works as too near the highway, also to the unsuitability of the site for sewage treatment, and the fact that the sewage from all the houses was not treated at one outfall works. It was stated at the meeting of the Council that the requirements of the Local Government Board were unreasonable and would cost about £10,000, while it was almost impracticable to include all the property in one outfall works. The matter was referred to the Parochial Committee.

**York Street, Leeds, Insanitary Area,** was the subject of a Local Government Board inquiry, held at the Leeds Town Hall, last week. Col. J. T. Marsh, R.E., conducted the inquiry with reference to the provisional order, confirmed by the Act of 1896, in regard to the housing of working people displaced under the York Street insanitary area scheme. What the Corporation ask is the exclusion from the scheme of a lodging house in Harper Street, and of certain land adjoining the North-Eastern Railway, and the sanction of the Board, under Article 3, sub-section 5, of the Order, to the disposal of certain land comprised in the scheme for purposes other than the erection of suitable dwellings for the accommodation of persons of the working class. The number of persons to be rehoused is 2,000. There was no opposition to the application.

**Wigan Gas and Sewage Works.**—A Local Government Board inquiry was held by Mr. W. A. Ducat into applications made by the Wigan Corporation to borrow £8,000 for sewage disposal works, and £5,000 for gas works purposes. The town clerk explained that the sewage works proposed were certain settling tanks and filter beds at the sewage farm. The application to borrow £5,000 for gas works improvements was next brought before the inspector. The town clerk said that sums totalling £39,000 were sanctioned in 1893, and the amounts had been spent in all cases except in those of the new retort house, where they had a balance of £1,131 13s. 6d.; the sidings extension, balance £213 12s. 3d.; the new purifier, balance £204 16s. 7d.; meters, balance £1,173 7s. 3d. The total balance underspent was £9,403 1s. 11d., and on the other hand, on other items they had overspent to the amount of £4,349 8s. 7d., which was chiefly made up of new mains £2,300, new services £855, and the washer scrubber £1,028, which was especially sanctioned.

**Sowerby Bridge Sewage.**—The District Council desire to borrow £2,000 in connection with their sewage scheme, and applied to the Local Government Board for permission to do so. An inquiry into the application was held last Wednesday. The scheme, it was stated, was originally sanctioned in 1880. A site for outfall works was then purchased in the Holmes for £4,000, and the amount granted for works was £10,643. Nothing whatever, however, was done by the Local Authority until 1893, when the Holmes site was abandoned, and a fresh site for outfall works secured at Milner Royd. In the construction of the sewers, the purchase of easements, &c., the amount sanctioned had already been exceeded to the extent of the £2,000 now applied for. To complete the scheme, and to carry out the outfall works, a further expenditure of about £7,000 would be necessary. It was also stated that the District Council had agreed to accept the sewage of the adjoining district of Sowerby, and that, if the Local Government Board insisted on their present requirements as to land, about 280 yards of sewer already laid would have to be taken up in order to extend the site to the necessary dimensions.

**Discoveries in Leeds.**—During the process of laying eleven fresh cables for the conveyance of electric light from the generating station of the Leeds Corporation in Aire Street to the centre of the city, the workmen came across a splendidly-preserved stone arched vault in Aire Street. Its area was 20ft. long, 12ft. wide, and 10ft. high to the crown of the arch. Subsequent excavations showed that it was one of a series of five beautifully-preserved arches of similar dimensions, the walls between the arches being about 4½ft. thick, and well preserved. It was discovered later that, in addition to the vaults having communication with each other, there was in the one farthest from Wellington Street an entrance to a subterranean passage.

Trade and Craft.

WOOD-WORKING MACHINERY.

The hand-power circular sawing machines of Messrs. F. W. Reynolds and Co. are perhaps too well known to our readers to need describing, but the "Queen" is one which is most likely not yet quite so well known, although

"QUEEN" COMBINATION CIRCULAR AND BAND SAW MACHINE.

its merits are sure to bring it to the front. It is constructed with a self-contained driving shaft, from which power is communicated to the saw spindle by means of a strong and durable driving chain below the table. The flywheel may be used on the saw spindle for ripping. The circular saw being made to rise and fall, the height of its teeth above the table may be regulated at pleasure to suit the depth of the rebate, groove, or tenon. It will cut 4½in. deep, and also cross-cut any length.

The "Queen" hand-power combined circular and band sawing machine is similar in every respect to the above-mentioned, with the addition of the band saw apparatus. It has the advantage that the circular saw can be used independently of the band saw, as the driving gear of the latter is made so as to be instantly disconnected when desired. The 12in. planing, jointing, trying-up, and moulding machine, No. 4 pattern, can be made to do a large variety of work, and the quality of the work turned out is excellent. Its approximate weight is, without countershaft, 8cwt., with countershaft, 9cwt. The vertical spindle moulding machine, No. 2 pattern, is specially suitable for making circular, irregular, and ornamental mouldings, which can be worked against the collars on the spindle or from a template. Architraves, sash bars, and straight mouldings, of all descriptions, can also be worked against the fence-plates. It is adaptable for planing, thicknessing, trying-up, chamfering, &c., and will work timber up to 4½in. deep. No. 3 pattern is fitted with a rising and falling spindle, worked by hand-wheel and screw, and is made both with collars and a square cutter block for holding the cutters. Its qualities can be summed up in a very few words; it is a reliable machine. The power tenoning machine, with self-contained countershaft, type B, is a very useful size for joiners and cabinet makers. It is very strong, and occupies little space. The table can be removed when it is not in use, and the swing bracket closed. The design of the patent guards for circular saws has certainly been considered with a view to securing the greatest possible amount of safety to the workman, and the least amount of hindrance to his work. It always remains in the same position, and does not require adjustment for every different thickness of wood, so that it is not a source of trouble or waste of time to the workman. The address of the firm is Acorn Works, Edward Street, Blackfriars Road, London, S.E.

# Property and Land Sales.

**TO BUILDERS AND OTHERS.—DAGENHAM, ESSEX.**—Valuable BLOCK OF FREEHOLD BUILDING LAND, comprising an area of  $\frac{3}{4}$  acres in an important corner position on the main London road, eight minutes from the station, with existing frontage of upwards of 700ft. to parish roads, and ripe for immediate erection of small houses, for which the demand is increasingly good. Excellent beds of sand and gravel.

**MESSRS. KEMSLEY will SELL the above** by AUCTION at the Mart, E.C., on MONDAY, JUNE 19th, at Two o'clock, in One Lot. Particulars of Messrs. WRENSTED and HIND, Solicitors, Ormond House, Great Trinity-lane, E.C.; and of the AUCTIONEERS, Railway Station, Woodford Green, and at Romford. 1

**TO BUILDERS AND OTHERS.—ILFORD.**—Absolutely ripe FREEHOLD BUILDING LAND, close to two parks and to Ilford Station, G.E.R., whence the city is reached in quarter of an hour. The land has important frontages to Ilford-lane, Hampton and Mortlake roads, and affords the choicest sites available in the vicinity for the immediate erection of first-rate shops and villas, for which there is a very keen and increasing demand from occupying purchasers. Ground rents readily created. Free conveyances, payment by instalments.

**MESSRS. KEMSLEY will SELL the above** by AUCTION, at the Angel Hotel, Ilford, on WEDNESDAY EVENING, JUNE 14th, at SEVEN, in lots to suit all buyers. Particulars of Messrs. PATERSON, SONS, and CANDLER, Solicitors, 26, Bouverie-street, E.C.; of A. W. HUDSON, Esq., Architect, 42, Bishopsgate-street, E.C.; and of the AUCTIONEERS, Railway Station, Woodford Green, and at Romford. 1

**BUILDING LAND (Freehold), at Buckhurst Hill, Essex,** frontage 155ft. to main London road; depth, 150ft., elevated position, overlooking Epping Forest; ten minutes from station, and thoroughly ripe for ERECTION OF SUPERIOR RESIDENCES. Price only £600 to close estate, payment by instalments if desired.—KEMSLEYS, Land Agents, Woodford Green. 1

**CLAPHAM.**—Freehold Building Land in the centre of a populous, well-established district close to the Common and the Railway Station.

**WEATHERALL and GREEN will SELL** by AUCTION at the Mart, City, on MONDAY, JULY 3rd, at TWO o'clock, 5 acres of FREEHOLD BUILDING LAND, in six lots, each containing plots of odd depth, and possessing excellent frontages on Ascot Road, Abbeville Road, and Briarwood Road, Clapham. Also a block of Freehold Building Land at the corner of Abbeville Road and Park-place, Clapham, on which at present stand Nos. 177 and 179, Abbeville Road, and 88, 90, and 92, Park Place, but high afford excellent facilities for the erection of several houses.

Particulars, with plans and conditions of sale, may be obtained of Messrs. HAWKS, STOKES, and MCKEWAN, Solicitors, 101, Borough High-street, S.E.; and of the AUCTIONEERS, 22, Chancery-lane. 1

**HARRINGAY PARK, Crouch Hill** (outside the jurisdiction of the L.C.C.).—Freehold Building Estate of 5 acres, three minutes from the Broadway, and five minutes from the station; ripe for immediate development for the erection of houses that readily let and sell.

**WEATHERALL and GREEN will SELL** by AUCTION at the Mart, E.C., on MONDAY, JULY 3rd, at Two o'clock, in one lot, the FREEHOLD BUILDING ESTATE of over 5 acres in extent, upon which at present stand Nos. 13 to 28, Harringay Park, on lot and producing £1,070 10s. per annum. This area of 5 acres is all matured land, surrounded by good roads, and ripe for the immediate creation of freehold round-rents, as about 2,000ft. of building frontage can easily be dealt with, and there also is the advantage to purchaser of the income from the existing rents which will be receivable until the scheme of development has been matured and the sites cleared. The estate is high and healthy, and modern houses are in great demand.

D. P. RODYK, Esq., Solicitor, 70a, Aldermanbury, E.C. Particulars at the Mart, and of the AUCTIONEERS, 22, Chancery-lane. 1

**FLEET STREET, CITY.**—By order of the Governors of St. Bartholomew's Hospital.—A fine commanding Building Site, occupying an area of about 2342 sq. ft. on the south side and newly widened part of this great main thoroughfare, within about 40 yards of Fleetgate-circus, having frontages of about 55ft. 6in. to Fleet-street and 51ft. 5in. to St. Bride's-avenue in the rear (facing St. Bride's Church); remarkably well lighted back and front, and suitable for the erection of first-class shops and business premises—a bank, newspaper or publishing office, or other important buildings adapted to the position.

**MESSRS. DEBENHAM, TEWSON, FARMER, and BRIDGEWATER** are instructed to LET by AUCTION, at the MART, on TUESDAY, JUNE 13th, at TWO, on a Building Lease, for a term of 80 years direct from the Freeholders, the very compact and valuable SITE of Nos. 90, 91, and 92, Fleet-street, and 2 and 3, St. Bride's-avenue, in the City of London.

Particulars, with plans, of Messrs. WILDE, MOORE, and WIGSTON, Solicitors, 21, College-hill, Cannon-street; of Messrs. E. FANNOS and SON, Architects and Surveyors, 7A, Laurence Pountney-hill, E.C.; at the Clerk's Office, St. Bartholomew's Hospital; and of the AUCTIONEERS, 80, Cheapside. 1

**KINGSFIELD ESTATE, WATFORD, HERTS.**  
**SEDGWICK, SON, and WEALL will SELL** by AUCTION, in a Marques on the Estate, on WEDNESDAY, JUNE 14th, 1899, at FOUR for FIVE o'clock, by direction of C. King-Smith, Esq., about 144 Plots of very valuable FREEHOLD BUILDING LAND, fronting Eastbury-road, and the two roads now being formed. Adjoining Bushey Station on the L. and N.W. Railway, Oxhey Church, and close to the town of Watford; healthy situation, 260ft. above sea level, and dry soil. The plots will have frontages varying from 25ft. to 50ft., and with depths varying from 150ft. to 200ft., and are very suitable for superior villa residences. Sewers, storm water drains, gas and Colne Valley water mains, are being laid in the roads. Nine-tenths of the purchase-money may remain on contract. Conveyances at stipulated fees. Tithe free, and land tax redeemed.

Particulars, with plans and conditions, may be obtained of Messrs. HEPBURN, SON, and CUTCLIFFE, Bird-in-Hand-court, 76, Cheapside, London, E.C.; and of the AUCTIONEERS, 38, High-street, Watford, Herts.

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

**R. I. B. A. EXAMS. PREPARATION,** personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**ARCHITECTURAL Institute, Society of** Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

**MASON'S CHISEL, STEEL,**  $\frac{1}{2}$  to  $\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$  in. to 4d. lb.—E. DEALEY, Moore-street, Sheffield. 8

## An Architectural Causerie.

**George the Fourth's London.** THERE is no period so quickly forgotten as that whose events have been described as "the history of the day before yesterday." It is true of buildings as of nations. A few famous structures, each representative of an epoch, have established a hold upon the popular imagination, structures of long ago standing out as landmarks, like Westminster Abbey and St. Paul's Cathedral. Great streets also attract the mind and are themselves landmarks; unfortunately they are far too rare in London. Ancient ones like Cheapside have been rebuilt, whilst those of modern times leave an indefinite impression upon the spectator. But there is one comparatively modern district which has a certain air of dignity and distinction, suitable to a great capital; this is the London of the Regency and the first quarter of the present century. Inferior in grandeur to the great group at Westminster and not associated with the Thames, the starting point of the old builders of London, it is nevertheless effective and dignified. Modern changes in building material, and the conception of what a city should be undoubtedly threaten it, but when built it effected a genuine improvement, and it remains to be seen if our generation with greater knowledge and newer appliances can beat it. When our century opened, what is now the most typical part of the West End was a great labyrinth of slums. Trafalgar Square, "the finest site in Europe" was covered with courts and alleys which would have disgraced Whitechapel; these bore curious names such as "the Carribee Islands," and "the Bermudas," whilst "Porridge Island" was full of cookshops; all accounts agree in describing them as mean, filthy, and disreputable. The northern part, including the site of the National Gallery, was long occupied by the King's Mews. In an earlier age Chaucer had held the office of "Clerk of the Mews at Charing," then a village; but the Mews were removed, and a menagerie of wild animals took their place. Mean, tortuous streets, whose inconvenience was not atoned for by any picturesque character, or historic association, led north-westward to Oxford Street, a name then recently assumed from that of "The Oxford Road." The Prince Regent lived at Carlton House, where Carlton House Terrace now stands, a Palladian palace not without merit: before it rose a large open screen of columns, whose purpose was not obvious, and gave rise to many gibes. To him, undoubtedly, the conception of a handsomer capital is due, but it would have remained unfulfilled had not an architect appeared to give it form and substance. This

was John Nash. Perhaps no man that ever played a part in the rebuilding of a capital has been more sharply criticised; contempt has been heaped upon all his work; it has been styled tame and formal, and he has been accused of not knowing the elements of his profession. Yet he produced a palatial quarter, convenient and dignified, and one street which is certainly the brightest, gayest, and airiest in the capital. That he was not the creator of any great building, nor an artist of high originality, may be admitted, but he understood proportion. His work was like that of Baron Haussman at a later period—to lay out thoroughfares, to give air and light, and to produce streets and squares in place of slums and alleys. In this he succeeded. He did not aim at the picturesque, as we understand it; his work is wholly Palladian, and, last but not least, he worked in stucco. This circumstance indeed is but a detail, and one, too, over which he had probably no control, but it has largely helped to prejudice him in the eyes

Nash's monument. Its success is due to its excellent proportions; a wide thoroughfare with houses of very moderate height, allows the sun's rays to flood the pavement and shop-windows; the Woods and Forests department is the ground landlord, and the leases contain a clause stipulating for frequent re-painting. It does not contain a single remarkable building, yet it is the most popular street in all England; it is bright almost at all times and its success and popularity are plainly due to its skilful design. In spite of the assumed "formality" of its Palladian, much variety exists in its designs, except in the Quadrant; but this is itself a clever piece of planning, and very effective with its bold, sweeping curves. Many obstacles were met with in carrying out the Prince Regent's idea, and the present street is admittedly a compromise: originally it was intended that one wide street should start from Carlton House, and run in a straight line to Regent's Park; but private rights and interests interposed, and

BEATEN METAL DOOR-PLATES AND HANDLES FOR A YACHT (ESCUTCHEONS COVERING KEYHOLES ARE ALSO IN BEATEN METAL; HANDLES ARE CAST.) DESIGNED AND EXECUTED BY EDGAR SIMPSON. (See p. 275.)

of the present generation. We little realise the sort of London from which Nash—helped and supported by the Prince Regent—really rescued us. He was bitterly assailed in his own time. Yet he found some supporters, though not until his work was complete and could be seen in full. "Whether the stranger," said an appreciative critic in the *New Monthly Magazine*, "traverses the splendid line of Regent Street, the Quadrant and Portland Place, until he reaches the Regent's Park, beautifully disposed and laid out in walks and groves, dotted with elegant villas. . . or takes his way from Waterloo Place towards Somerset House, and sees before him streets and places and arcades occupying the sites of the filthiest courts imaginable, his first inquiry will be to whose taste, genius and enterprise are these improvements owing? He will be answered that they are all attributable to the genius, energy and talent of Mr. Nash, to abuse and ridicule whom was the fashion of the time in which he lived." Regent Street is really

Nash was compelled to divert it at the top of the rising ground. Resolved, however, upon carrying it northward parallel to the original line, he happily solved the difficulty by taking it round a quadrant. As we now see it, the street is much injured by the loss of its Doric colonnade; this was removed in 1848, and a rather feeble balcony substituted. The cost of the entire street was as nearly as possible a million and a half sterling. To the Prince Regent and Nash we owe Regent's Park, originally known as Marylebone Park Fields. Nash commenced it in 1812, at the same time as Regent Street. Here again detraction has followed him, for if the park be admired for its skilful arrangement and planting of ornamental timber and shrubs, Nash's terraces—that is, all except Cornwall and Munster and Cambridge Gate, which has been rebuilt—are condemned as spiritless. On the whole, however, they are lines of pleasant, comfortable English homes, in accordance with the taste of the time; if not picturesque, they are at least free from affectation, and they

act as a frame to the wide expanse of green-sward and stately trees. One of the most beautiful features of the park is the Regent's Canal, with its green banks and May trees; this, too, is partly Nash's design, though James Morgan was the engineer—an association of two allied professions, which, if adopted in our own day, might have saved many mistakes. Returning to Pall Mall, the United Service Club is by Nash; the Athenæum, its opposite neighbour, is by a man who has been too quickly forgotten, Decimus Burton. How will the former fare if the whole neighbourhood be rebuilt on the colossal scale of the Carlton Hotel, which already somewhat dwarfs it? And how will Regent Street look if structures towering to the height of that which has taken the place of Hanover Chapel are raised on both sides and throughout its length. What will become of its light and sunny appearance? It may be noted that in Paris, where new streets are very wide and the sky is very bright, the limit of height for many years was 60ft.; in London (by the London Streets and Building Acts) it is 80ft., and that too in a climate which is not too liberally provided with light. But in the matter of street designing proportion is everything, and here, whatever his other defects, Nash was simply admirable. The Marble Arch is his design; it originally stood in front of Buckingham Palace, and was removed to Cumberland Gate, Hyde Park, in 1851. It sorely needs completion in the form of a group of statuary above it. The arch is of pure Carrara marble, and cost thirty thousand pounds. Trafalgar Square and its approaches are not wholly Nash's work. The National Gallery has been as much criticised as any production of his, but it is due to Wilkins. The latter was capable of better designs, as witness his excellent portico and court at University College. The story of his National Gallery is a painful one. He was given the old columns, entablatures, and other stonework of Carlton House, then being pulled down, and told to work them into his gallery. He did his best, but was thwarted and embarrassed at every turn by his employers. His history illustrates only too well the way in which England treats her architects. J. C. P.

## OUR COMPETITION.

THE following is a complete list of the designs received:—

Abacus, Ad Rem, Ad utrumque paratus, Ad Valorem, Albion, Alfio, Appliqué, Aurora Borealis, Barbara, Black "●," Bluebell, Brum, Build, Con'M, Caractacus, Carnation, Casement, Charter, Christian, Cleopatra, Clerk of Works (two sets), Clodhopper, Comfort and Convenience, Compass, Cottage Ornée, Craignez Honte, Cypress, Domi, Domus, Dormouse, Dulce Domum, Dulce Domum 2nd, Dum Spiro Spero, Endeavour, Eros, Esprit, Firefly, 500 to 1 Chance, Flint, Forward, Fox, Furor, Gables, Gipsy, Gordon, Gradatim, Gray's Inn, Grey Man, Guido, Habitable, Hawthorn, Heather, Heather 2nd, Hen Pewyl, Home, Homé 2nd, Homestead, Horndean, Hospice, How, Ingle, Joss, Kentish Rag, Knight, Kooms, L.A.Q., L.N.Z., Lib Nell, Lilac, Long and Low, Long and Low 2nd, Lyn, Man of Kent, Martello, Meliora Sperando, Muff, N. or M., Nemo, XIX. Century (two sets), No. 113, North West, Nulli Secundus, Ogee (two sets), Old Time Glory, Pippa, Prêx d'Accomplir, Pulo, Q.E.F., Quercus, Quex, Quis, Raider, Red Rose, Red Roofs, Regis, Rex, Riggs, Rough Cast, Rus, Rustic, St. Crispin, Seagull, Simplex, Squirrel, Sou' Wester, Speedwell, Star, Strata, Sunshine, Sussex, T Square, Tempus Fugit, Thatch, Thatch Roof, Thislixum, Thrums, Torso, Tribly, Try, Tucro, 23, Tyke, Unus, Vau, Vim, White Heather, Whist, Yew, Young 'Un, Young Will.

Othniel has only sent two plans with his envelope and will therefore be disqualified.

## On Reflection.

### The Revival of Mediævalism.

THERE seems to be at the present time a disposition in many quarters to return to mediæval ideas and practices. The ecclesiastic seeks to restore in the church the ritual of pre-Reformation days; the art worker finds his Golden Age in days before the invention of machinery, when every craftsman had a chance to be—and often was—an artist; the social reformer longs for the return of the simpler forms of living and the more human relationships between masters and men that characterised an earlier age. Within certain limits the tendency no doubt makes for good. It is well to remember that our modern progress is not unmixed gain, and that in spite of our increased wealth and enlarged opportunities there are some beautiful things that we have lost, or are in danger of losing. But although it is well to preserve what was good in the spirit of a former age, it is impossible to preserve forms and usages that had their *raison d'être* in conditions that have passed away; placed in a different environment these become out of place and even ridiculous. For this reason we are not disposed to regard the coming revival of that old English form of entertainment, the Masque, as possessing more than a merely antiquarian interest. The Art Workers' Guild have been hard at work on the scheme for nearly two years, and they will shortly produce at the Guildhall an entertainment which is to reproduce—with a difference—the form of histrionic art which delighted our forefathers of two centuries ago, and commanded the best poetic and artistic talent of the time. It is this combination of efforts by various art workers—poet, artist, musician—that gives to the Masque much of its charm in the eyes of its admirers. We gather from certain forewords that have appeared in the press that there is to be a moral purpose underlying the Allegory. We are to witness the discomfiture of dragons and demons, including such up-to-date examples as Philistinus, Scampius, Shumlordus, and Jerry, and we are to be instructed thereby, as our fathers before the days of Board Schools were instructed by witnessing miracle plays. Did we not believe the Art Workers to be serious people, we should be tempted to regard the whole affair as an elaborate joke. But we are assured that it has a serious purpose, which is nothing less than to show how London may become in future the most beautiful as well as the greatest of cities.

**A Model Village.** THAT is an end well worth striving for. It is worth while, however, to consider along what lines we may most reasonably hope for anything like a general revival of a sense of the beautiful. We are convinced that it is not to be sought by the restoration of customs and forms belonging to a less scientific, if a more picturesque, age, or by waging hopeless warfare against machinery, factories, and railways. The wiser and more practical course is to accept frankly, even thankfully, these modern conditions and seek to engraft upon them such elements of beauty as we can. We may admire the ideals of Ruskin and William Morris, and wish it were possible for every workman to take a pleasure in his work, to put into it some individuality and some thought. But unfortunately this is not possible under modern conditions; the introduction of machinery into nearly all trades, with the resultant division of labour and enormously increased output, has converted the craftsman of a former generation into the mere machine-minder. The community on the whole benefits from this, but it is inimical to the cultivation of the æsthetic sense and

of some other of the higher qualities. That side, therefore, of a man's nature which is starved in the process of his daily toil must be cultivated by other means. A good example of one way in which this may be done is afforded by the model village at Port Sunlight, which Messrs. Lever Brothers have erected for the accommodation of the workpeople engaged at their soap factory. We fear there can be little that is æsthetic or elevating in the daily toil of the hands at a soap factory. But soap, one may suppose, is a necessity of even a comparatively primitive civilisation; soap factories, therefore, there must be. One can well believe that their charming village home, with its picturesque and well-built cottages, its ample breathing spaces, and its opportunities for self improvement and healthful recreation must exercise on the workers an elevating and refining influence, and provide just the antidote that is needed for the deadening influences of factory life. The village has attracted attention even outside England, and we note that it forms the subject of an illustrated article in the American "Architectural Review" for May. It shows how important a part the architect may play in the beautifying and uplifting of the common life, even under the economic conditions that prevail to-day. It would be an enormous gain to the community, in more ways than one, if villages such as this were to spring up on the outskirts of every manufacturing town, providing the workers with cleaner, healthier, cheaper, and more beautiful homes than they could possibly find in the crowded tenements of the city.

### The Need for Technical Instruction.

AN Exhibition has just been opened at the Imperial Institute which deserves attention altogether apart from any scientific or artistic value possessed by the articles exhibited. It is a display of practical work executed by candidates at the examinations for 1899 of the City and Guilds of London Institute, and its interest lies in the fact that it affords a rough means of gauging the extent and value of the technical and technological instruction those who are to be the skilled workmen of the future are receiving. It is a matter of national importance that this instruction should be thorough and efficient, and that large numbers of young workmen should take advantage of it. There is practically no other means in these days for maintaining and raising the standard of workmanship. Even in those trades where apprenticeship is still the rule, it is very seldom made the means of giving a lad the thorough training needed to make him a master of his craft. In the stress of modern competition, masters and foremen cannot find the time, even if they have the inclination, to give their apprentices an all-round training. The Duke of Devonshire, in opening the exhibition last Friday, paid a well deserved tribute to the Institution which has been the pioneer of technical instruction in England. During recent years many other bodies—School Boards, County Councils and Polytechnics—have taken up the work of technical and manual training, and most of them have modelled their efforts on the City and Guilds Institute. There is room for all the work that is being done in this direction, and for much more. The artisan students in the registered classes of the Institute throughout the country number over 34,000. That is a good record, but it still remains true that the great majority of young artisans are as yet untouched by these efforts and those of similar organisations. What is now wanted is to arouse in masters and workmen alike so strong a sense of the importance of technical and technological education in these days of foreign competition, that they shall be equally anxious to take advantage of all the opportunities available.

ELECTRIC LIGHT REFLECTORS IN REPOUSSÉ COPPER. DESIGNED AND EXECUTED BY EDGAR SIMPSON.

## THE PERMANENT GALLERY OF DECORATIVE ART.

By ERNEST RADFORD.

AN institution, the value of which is undoubted, has lately been opened at No. 9, Harrington Road, South Kensington. The idea, we are told, is to give designers and craftsmen an opportunity they might not otherwise have of showing their best in London. In order that there may be no suspicion of its being either shop or bazaar, there is no commission exacted on sales, and the moderate fees that are paid are expected to do little more than merely support the establishment. There would hardly be room for any bad work in the place even if there were any desire to admit it, and the consequence is that the visitor sees a surprising proportion of really good things. The absence of anything amateurish seems to limit the critic to the expression of his opinions on style. An absolute purist might wish that evidently careful work were not so liberally bestowed upon things designed in a fashion which he himself does not approve of, but the more catholic mind, that sees nothing but beauty in "Art," will have little to do but praise.

The illustrations which accompany this notice are supplied in the main by artists residing as far from London as Nottingham and Altringham, Cheshire. There are many similarly placed, to whom the advantages of such an establishment should be considerable, and others, even more numerous, who for all practical purposes might as well be in Jericho as in the outlying suburbs of London. Whoever visits the place within the next few weeks will be shown designs by Miss Eustace for frieze and brocade which must be admired; by Miss Lowndes, some delightfully

imperfect "wood-white" glass for window panings, which she herself makes. Mr. J. M. Ellwood is very well-known for what he makes and designs of furniture, but is now courting fame with brooches and jewels which he has designed or executed. Mr. Ellwood prefers the lumpier kinds of old furniture; while Mr. Chas. Spooner's taste is for cabinet work at once light and durable—the design of the simplest, and the ornament reduced to a minimum, so that the thing itself commands praise, not what has been lavished upon it.

Mr. R. M. Nance shows a three-fold screen of which no idea can be given in prose. Although simply a painting in oil it is decorative to an amazing degree. The subject, a "Whirlpool" describing a circle as large as the extent of the surface allows, into which will be drawn, unless human effort can save it, the wierdest sea-faring vessel that ever has been depicted. This alone is worth a long journey, and most certainly should be seen.

To return to our illustrations, they are examples of repoussé and pierced metal work supplied by the kindness of Mr. Edgar Simpson; of wood-carvings by Mr. Joseph Phillips; and of decorative designs by Miss H. M. Pemberton.

## NURSERY RHYMES FOR BUILDERS.

Prepared by the London County Council under the provisions of the 164th Section of the London Building Act, 1894

"DICKERY, DICKERY, DOCK."

(By-law 1891 [3]).

Dickery, dickery, dock!  
A place-brick's not a stock;  
But sure as a gun,  
It will pass for one,  
If you know what's o'clock.

### A Central Fire Station at Scarborough.

The Streets Committee of the Scarborough Corporation have approved of a scheme for erecting a central fire station in North Marine Road, at a cost of £3,000. Tenders are invited.

### A New School for the Catholic Blind

is to be erected at West Derby at a total cost of about £4,000. The building is to be of plain Gothic description in brick, and has been designed by Messrs. Linnott, Linnott, and Powell, architects, of Harrington Street, Liverpool.

**Improvements at Middlesbrough.**—The first sod of a new road and railway on the north bank of the Tees, opposite Middlesbrough, was cut by Sir Lowthian Bell a short time ago, and Sir Joseph Pease, M.P., laid the foundation-stone of the new Tees Conservancy offices at Middlesbrough.

## NOTES ON ART.\*

By WILLIAM MEEK PAGE.

(Concluded from page 264, No. CCXXVI.)

LET us look at a modern suburban villa. When you approach it you are conscious of receiving a shock as the glaring mass of stone and plate glass bursts upon your affrighted gaze. The front is heavily ornamented, the sides and back are destitute of any adornment—we are evidently not intended to look at these—and the whole thing forms a mass; there is no grouping, form, or proportion, given to it. The front railings and gates are heavy and florid with gilded tips; the walk, of uncomfortable, crunchy gravel, has painfully correct flower beds on either side and rustic seats of iron. The foot scraper is crude and ugly, and you are not meant to scrape your boots thereon. The front door is of imitation oak or walnut, and there is now, alas! no quaint "tirlin pin" or knocker; ah! no, we no longer knock for admission, we have to "push." The tiles in the lobby arrest your attention and deviate your footsteps because of their vividness and slipperiness. The glass door, resplendent in red and blue glass, still looks painfully newly varnished and actually sticks as you push it open. If you gain the further side of the coat and hat stand without several more "tiles" and sticks obstructing the way—for hats have a knack of falling off those stands—you will find yourself confronted by the staircase, a stretch of wood and varnish, with more red and blue light. The lobby lamp has an

ELECTRIC BELL-PUSH. DESIGNED AND EXECUTED BY EDGAR SIMPSON.

almost toy-shop appearance, while the cornice and plaster ornaments which literally cover the ceiling are too much for any words. The ceilings are too high; the windows far too large, admitting too much light, and letting all the heat escape; the venetian blinds are green and noisy; the chimney place is a sham; it is of iron or slate or wood, but pretends to be much more, something finer; its proportion is bad, as is also that of the doors; cornices, architraves and mouldings are all too large. In fact, those things are used in houses, up the street and down the street, without their fitness ever being considered. Nor will I guarantee the efficacy of drains and flues, for I have seen the smoke finding an outlet for itself at the gas-alier (another wonderful feature) and at the window. But enough; everywhere unrest, bad taste. Art conspicuous by its absence.

Nothing has form, proportion, dignity, beauty, but on every hand are inconsistencies in design and colour, untruthfulness in construction, and very often bad workmanship, all the result of a work over which there was no presiding spirit, on which there were no love and knowledge lavished. Why make your door of deal and then grain it oak—that

\* Abstract of a paper read before the Perth Architectural Society on March 14th, 1899.

DESIGN FOR GLAZED TILE (PRINTED OUTLINE). BY HILDA M. PEMBERTON.

form of decoration dear to railway companies? Why have your chimney-piece of wood and make it imitate marble? Why hide that joining in the wood if it is well made? Why elaborate with ridiculous ornament the front of your house? Some people ignore the vulgar show and look round the corners. Why build your house of brick or wood and then try to make it resemble stone? Why do we do all this and then make a futile effort to make our home "artistic" by smearing jim-crack furniture with enamel and crowding our rooms with ill-made, impossible furniture, screens and vases, making them like some fancy bazaar? Everywhere we have superficialities, shams, inappropriate ornament, ponderous ugliness.

This is not Art because it is not true, not genuine. Architecture is building in its best form, constructive and artistic, and if truth is not in the foundations it is idle to suppose that it can blossom forth into beautiful forms on the façade. Let everything we build be *genuine*, let that be the first essential. Let us employ our materials in an honest straightforward manner, putting forth our best skill and best workmanship, allowing nothing to be hidden, nothing to appear what it is not, everything to perform its own part and tell its own story. Begin at the foundation, working from a genuine specification, with genuine materials, even up to the very apex, and the result will be a genuine whole, highly artistic, because of its genuineness and truth.

How much happier might the people be if, instead of the squalor and sordidness characteristic of our most recently erected towns, the streets were lined with beautiful buildings; the houses more attractive and artistic; the churches more worthy of our creed. "A picture remains in the gallery; a book upon its shelf, but our buildings are for ever before our eyes on our daily walks, and depress each passer-by by their ugliness, or elevate him by their beauty."

Do not suppose for a moment that I in any way suggest a mere system of picture making, houses that will merely be pleasing to the eye. They must, in the first instance, be constructed on the soundest principles, and every precaution taken to ensure perfect sanitation and hygienic requirements. They must not only be adornments to the town, but must do something to alleviate disease, suffering, and death in all densely populated centres, teaching the people not only the laws of beauty, but helping them to lead cleaner, sweeter, healthier lives. I plead for improved Architecture, for more beautiful buildings. I do not mean highly decorated ones, but buildings which shall be beautiful irrespective of their adornment, beautiful in form, conception, proportion and grouping. I do not say that elaborate buildings may not be highly artistic, but unless the same magnificent scheme can be carried throughout, and that correctly, the mere ornament is futile. Men have not performed their duty when they build an erection for the accommodation of themselves, their manufactory or trade; they still owe a duty

DADO PATTERN. BY HILDA M. PEMBERTON. (See p. 275.)

to their fellow men, to Art, and to themselves. The amenity of their city is in their hands. Let them remember that all that remains of a people are its literature, painting, and architecture, and that every time a man builds he raises unto himself a monument, which shall remain when he is not. It is not sufficient to have a history of Art, but it is our duty to add to it worthily, and to have present day architecture of a high order. "Degrade first the arts if you would mankind degrade," says Blake.

And now I should just like to point out that while everyone who builds bears a great responsibility, yet it is to the architect we look to carry out every scheme worthily, and his responsibility is still greater. His duties are multitudinous and are daily becoming more so, but this is no excuse for his doing bad or slovenly work. He must thoroughly understand his client and grasp his client's ideas; if the building is for manufacturing purposes he must acquire a knowledge of the requirements; if a house, of the people's habits and so on, and by dint of going into and mastering every detail, however small, produce a whole as nearly perfect as may be. He must spend his client's money to the best advantage, and spare himself no pains to produce a building, well and economically built, and an architectural acquisition to the town. He must see that the work is carried out strictly in accordance with his intentions and that the proper materials are used, contenting himself not only with specifying the best materials, but, by means of supervision, seeing that they are used and everything is carried out correctly. He must take his client along with him in everything, reasoning gently, but firmly, against those proposals of which he does not approve and which he knows to be wrong, accepting thankfully the suggestions that are good; every new undertaking will then prove itself to be an education to both client and architect and will contribute greatly to the advancement of good art.

Happily we have to-day architects who are working hard to raise the standard of our art, and we have artists co-operating with them and lending them valuable assistance. Our delightful domestic architecture has been revived and is built at the hands of such

eminent architects as Norman Shaw, Ernest Newton, C. F. A. Voysey, John Belcher, Grayson and Ould, and others. A hundred years ago the artist was a man who painted large oil pictures, the larger the better. To a great extent, this idea still lingers, but it is being replaced by the artist suggested by the times of the Early Renaissance, when each painter was a craftsman in some form of art work. As it was then, it is beginning to be realised now that to the true artist no form of art work is other than acceptable. Already in some parts is great improvement effected; already we have men who realise their duty and who are establishing beautiful communities; but ruts are deep and mankind is callous, and we must content ourselves with helping on and seeing that the progress, if slow, is sure.

I take it for granted that you are all more or less interested in this, and that the object of an Architectural Society is not the study of Architecture alone, but that you take a sincere interest in Art in the widest sense, and are anxious to promote art culture amongst the people. This, indeed, is your duty. How, then, may we pursue this path—a path bordered with pure delights, leading to a goal which is golden and satisfying beyond measure? It is only by dint of hard, unceasing work that we can ever hope to be masters of our profession to any extent; it is only by paying careful attention to everything pertaining to the office work, from the merest detail, observing system, care and thoroughness, acquiring a complete knowledge of construction and design, attaining proficiency in draughtsmanship, and conjointly with this a regular inspection at the building itself, learning how things are actually done, and seeing what you design and draw on paper perpetuated in lasting material. Although it may be given to few of us to become famous architects, yet we have all our own part to perform, however small, and just as the old master painters used to employ their pupils to paint in a seemingly unimportant part of their immortal canvasses—a part, however, that helped to make up the magnificent whole—so must we endeavour to make our small part thorough, realising that "trifles make perfection, and perfection is no trifle." We can study in our schools of art, in our academies, our galleries, and in our libraries; we can study in the woods, by the river, on the hill.

Nature lies before us, boundless, inexhaustible, full of beauty, ceaseless change, romance and mystery. Her fountains are filled with unending knowledge and still unplumbed depths. We have the masterpieces of the past and those of to-day to study and enjoy. Do not give way to criticism or mere fault-finding, which is futile and unbeneficial, but look earnestly and searchingly for what is good and beautiful.

The history of Art is long, but it is not yet finished. The age of Painting is not past. The time of Sculpture has not yet been concluded. Literature and Poetry shall still remain to sing of what is good and beautiful. Architecture has not ceased to rear homes for man and his arts. These things belong to all times and all peoples, and though the eras to come may not be like those of the past, we look with confidence into the future, feeling assured that man will continue to teach that Art is truth; that he will still labour on

TILES. BY HILDA M. PEMBERTON. (See p. 275.)

stimulated by the golden record which trails behind him into the shadowy past, and continue in these paths which have been trod for countless ages to the Glory of God and the betterment of man.

## ACCOUNTS FOR ARCHITECTS.

By HENRY CALDER MARSHALL, F.C.A.

[I]N the hope of gathering some useful information on this subject, I recently called upon two architects of my acquaintance. In reply to my questions as to how they kept their accounts and what books they made use of, architect No. 1 replied, "Accounts! books! Oh, yes! I have my bank pass-book and keep a letter book; now, what more can I want?" said architect No. 2, "I keep a letter-book and have my bank pass-book, and they are quite enough for me."

Now I hope you will not imagine that I for the moment think, that if I called upon all the architects whose names appear in the "London Post Office Directory," I should receive similar information. I should hope not; but one thing I feel sure of, and that is, there are very many professional men who keep no accounts at all, or who have a system of accounts, somewhat similar to my friends', consisting of bankers' pass-book and a letter-book, totally inadequate either to the requirements of their business or even as a record of their household and personal expenditure.

I would therefore call my readers' attention to a few remarks, firstly, as to the necessity and advantage of keeping proper accounts; and, secondly, as to a simple system of accounts, suitable for the profession of an architect, and I would ask their indulgence if I appear to go too much into detail. We have to build up as we go along, "Line upon line, precept upon precept, here a little, there a little," until we have the fabric fully completed, a credit both to the architect and the builder—or I should say to the accountant and book-keeper.

Firstly, then, as to the necessity and advantage of keeping proper accounts. Among other purposes, accounts, proper and correct, may be required for the following:—

- (a) Showing the amount of business done, or the purpose of admitting a new partner for partnership adjustments;
- (b) Showing the profits for the purpose of income tax, or for production to the assessors or commissioners;
- (c) For production to bankers or others in the case of requiring a temporary loan;
- (d) For production (if necessity requires it) to the Law Courts;
- (e) For showing profits, in order to arrive at the value of the goodwill and for ascertaining

CARVED OAK PANEL. BY JOSEPH PHILLIPS.  
(See p. 275.)

the amount of outstandings for the preparation of the accounts for probate, or for the administration of an estate in the case of intestacy;

(f) And last, though not least—but let us hope it will never be required by any reader of the BUILDERS' JOURNAL—for the purpose of the deficiency account under the Bankruptcy Act.

Let us now deal with each of these headings *seriatim*.

(a) Suppose an architect in practice finds his business increase in such a way that the work becomes too much for him. He requires a partner to bring in a certain amount of capital and to relieve him of some part of the work. The architect, knowing that he has a good and well-established connection, is naturally not particularly anxious to let anyone come in and take a share of his hard-earned business for nothing, so decides to make the incoming partner pay a good round sum for the goodwill, and arbitrarily fixes an amount. The incoming man demurs at the figure asked and enquires how it has been arrived at. "Oh!" says the architect, who like my friends relies on his bank pass-book, "look at what my takings have been," and so he takes the total of the "payments in" side of the pass-book quite oblivious to the fact that there might be items received in the business that have not been paid into the bank, and *vice versa*, there might be sums paid into the bank that do not pertain to the business; there might also be loans which would go to swell the total, without really, of course, being takings of the business; there might, also, be amounts of cheques returned for re-endorsement and paid in a second time; and above all the pass-book might be wrong—bankers' clerks like other men are not infallible. On the other side there might be loans repaid and cheques paid in but returned for endorsement, and, certainly, any cheques that have been drawn but not presented, would not appear in the pass-book at all.

The banker's pass-book is all very well and useful for showing the state of your banking

account at any given date, but for no other purpose. It cannot take the place of a properly drawn up and correctly kept cash-book.

The incoming partner objects to taking only the pass-book figures, so an accountant is called in, who, with a great deal of perseverance and at a considerable expenditure of time, and at the expense of the architect, produces an account by analysing the pass-book and writing up a proper cash-book therefrom, and from the counterfoils of the paying-in book and cheque-book, and going carefully and systematically through the letter-book, and writing up commission book, etc., from it. This account shows the profit to be considerably less than it was thought to be, and much to the chagrin of the architect the negotiations fall through. Now had there been an adequate system of accounts showing properly the takings and the net profits of the business, correct figures would have been submitted in the first place to the proposed incoming partner, and the negotiations would probably have been carried through to the satisfaction of all concerned.

Of course, where a partnership has already been entered into, it is more than ever a necessity to keep true and correct accounts and to have a proper system of book-keeping. Do we not often hear of disputes and disagreements between partners, and of final adjustments of partnership accounts.

You will, I think, quite see that with only the pass-book before us we get no information on the following points essential to the making up of a correct balance sheet and profit and loss account:—

1. Money owed and owing at the commencement of the financial year.
2. Money owed and owing at the close of the financial year.
3. Business in hand, both at the commencement and end of year.
4. The separation of capital and revenue accounts, and the raising of accounts for the depreciation of leases, furniture, &c., also the reserve for bad debts.

It is clear, therefore, that the pass-book does not have a very prominent place in a system of book-keeping. As I have already stated it is a useful book, but only in a subsidiary way, as a means of showing the state of your banking account and for reconciling therewith the balance of cash as shown in your cash-book, but it does not show either the gross takings or net profits of your business.

(b) Accounts may be required for the purpose of showing the profits for income tax or for production to the assessors or commissioners.

How many complaints we hear on all sides

PIERCED AND REPOUSSE COPPER DOOR-PLATE AND ELECTRIC BELL-PUSHES. DESIGNED AND EXECUTED BY EDGAR SIMPSON. (See p. 275.)

CARVED OAK PANEL. BY JOSEPH PHILLIPS.  
(See p. 275.)

of the iniquity of the income tax and the unreasonableness of the assessors and commissioners. Of the iniquity of the tax I have nothing to say—it has been imposed and we must submit, cheerfully if we can. There is not a single individual, I take it, who would not rather be in a position to pay the income tax collector a larger sum than he already does. Of the unreasonableness of the assessors and commissioners I have this much to say, that I have always found them very amenable to reason, and that in any dealings I have ever had with them I have been treated with every courtesy; of course, we cannot expect them in every case to see eye to eye with us, and it is this, I think, that causes people to complain of their unreasonableness. They have their duty to perform, not always a pleasant task, and they are not often thanked for performing it.

It is wonderful to me how elastic, as a rule, people's consciences are. When filling up the income tax return they seem to look at their profits through the large end of a telescope,

reliable data to go upon, especially if your accounts have been made up or audited by a duly qualified accountant.

(c) Accounts may be needed for production to bankers or others in the case of requiring a temporary loan.

It may be that a time comes when financial assistance is required to tide over some temporary difficulty, and the architect naturally turns to his bankers for such assistance. The first question that will probably be asked is: "Where are your accounts?" If the answer is: "Oh, I keep none, I rely on my pass-book," there is every likelihood that he will be politely told that the money cannot be advanced. See in how much better a position the man is who can produce a properly drawn-up balance sheet and accounts, especially if the figures have been verified by a chartered accountant; even, I take it, if the profit and loss account only show a small margin of profit. The banker sees that his client is a careful man. In the balance sheet he finds a

We appoint our friends executors of our wills, but do we at the same time try to ease their work by having our accounts in such order that, when we are called to "join the great majority," the work we leave our executors to do is comparatively easy and straightforward? Not if we only leave them a bank pass-book and letter book, together with a chaotic mass of vouchers and papers to wade through. Poor executors! Ill requited by the legacy of twenty-five or even fifty guineas mentioned in the will.

(f) Accounts may be required for the purpose of the deficiency account, under the Bankruptcy Act.

The deficiency account is to the perplexed and harassed bankrupt the most unsatisfactory of all the forms he has to fill up. It is so difficult to account for the disposal not only of your income but of your deficiency—that is, the difference between your assets and your liabilities; and, if you have only your pass-book as a guide, I fail to see how it can be

LISIEUX CATHEDRAL. SKETCHED BY G. A. T. MIDDLETON.

minimising them down almost to vanishing point; but give them a new road or a railway compensation claim to make up—what a change—the profits, barely visible for income tax purposes, assume gigantic proportions. It is human nature, I suppose, so we must bear with it.

With only a pass-book I do not see how the Income Tax return can be properly filled up, and the ratepayer stands a chance of cheating either himself or the Government if he relies upon getting his information from that source alone. The pass-book might contain dividends from which the tax has already been deducted, and he would be paying twice over—a thing, I think, nobody ever wishes to do.

If you have a properly drawn-up balance sheet and profit and loss account before you, the matter becomes much easier, and, should you be called upon to appear before the income tax authorities, you will have some

statement of his client's liabilities and of his assets, and can judge therefrom as to his solvency, and consider whether or no it would be prudent to make the loan.

(d) Accounts may be required for production as evidence in the law courts.

In such a case how awkward it would be if you had only a bank pass-book to produce; as we have seen, nothing satisfactory can be got from it. You may, through not having proper books, lose your case, and retire from the court a wiser and a sadder man, determined, perhaps, to keep your books on some proper system, and not to rely any longer on the broken reed of a pass-book.

(e) Accounts may be required for showing profits in order to arrive at the value of the goodwill, and for ascertaining the amount of outstandings for the preparation of the accounts for probate or for the administration of an estate in the case of intestacy.

done, for even with properly kept books it is no easy task, and woe betide you when you appear before the Official Receiver with an unsatisfactory deficiency account. Then there is the penalty attached to the neglect of keeping a proper system of accounts. The Act provides that under certain conditions, and on proof of certain facts, the Court shall suspend the discharge of the bankrupt. One of the facts reads as follows:—"That the bankrupt has omitted to keep such books of account as are usual and proper in the business carried on by him, and as sufficiently to disclose his business transactions and financial position within the three years immediately preceding his bankruptcy." The meaning of this is that his books must be kept in such a way as to show at once, without the necessity of investigation by a skilled accountant, the state of his business.

HOUSE, RUE CONDORSET, LISIEUX. DRAWN BY J. EDWIN FORBES.

So far I have been trying to prove by a negative argument, if I may so term it, the advantages of keeping proper accounts, or, I should say, the disadvantages of not keeping them. Let us, in a few words try to prove the same by a positive argument.

We all like, I take it, to know how we are going along, what profits we have made during the year, so that we may perchance be able to launch out a bit, or put by something for a rainy day, or indulge in some extra luxury, enjoy a more protracted holiday, or, perhaps, treat ourselves to a new bicycle, or a camera, and so follow up a pet hobby. How much more we enjoy these things when we know the money is really earned and that our accounts are all correct. Besides, you know without an adequate system of book-keeping, how can we look after our business efficiently, or know all the necessary details. Should, however, misfortune smile on us, that is, if misfortune can be said to smile, and our accounts show a loss instead of a profit, how much better it is to face the difficulty and to know the worst at once. And if we keep our books on a proper system it is even a grim satisfaction to know where the shoe pinches and so to regulate our expenditure, and if we are wise men retrench where necessary.

I think now that all my readers will agree with me that there is an advantage in keeping proper accounts, and I hope that they will even go so far with me as to say that it is an absolute necessity.

In France and other countries where the Code Napoleon prevails, it is obligatory for everyone in business to keep proper books, and not only so, but in the case of one book, "the journal," each page is numbered and stamped and is revised by the President of the Tribunal of Commerce, the mayor, or other authority. No blanks, erasures, tearings out, or addition of pages are allowed, and you are only permitted to have one journal at a time, which, when finished, is so marked before a new one is allowed to be commenced.

(To be continued.)

A Cottage Hospital is to be erected at Blairgowrie, at a cost of about £5,000. The accommodation will consist of two large wards for male and female patients, and a special ward for isolated cases; there will also be a matron's room, operating room, dispensary, bath-room, kitchen, &c. The building will be of Blairgowrie Quarry material, with Bannockburn stone for facings. Mr. Lake Falconer is the architect.

## SOME NOTES FROM LISIEUX.

By G. A. T. MIDDLETON.

NORMANDY has always been a somewhat favourite sketching ground for the architectural student, and Lisieux has come in for quite its fair share of attention. Now that a direct steam-boat service has been arranged from Newhaven and Caen it is likely to become more popular than ever, as it will be easy to reach and comparatively inexpensive. In fact, a holiday in Normandy costs but little more than one in England, while there is all the

added stimulus of a foreign tongue and foreign ways. The general risk is that the student will acquire a knowledge of foreign rather than of English architectural details, but this is not so likely in Normandy as in most other parts of the Continent. For many hundred years Normandy and England were under the same rule, and communication was close and constant, so that the work of part of France and of the South of England may naturally be expected to be of similar character.

In Lisieux, both the similarities and dissimilarities are easily found and noted. There is one great church, formerly the Cathedral, the Romanesque work of which has been restored, and its character greatly lost, but this is scarcely the case with the Gothic. Even the light perspective sketch of the north transept, made one sunny day a few years ago, shows long lancet windows which are much more English than Continental in appearance, in fact, such thirteenth century work is very rare abroad, it being almost always traceried, and the windows being generally wider. But here at Lisieux it is as simple as at Whitby.

This is not the case, however, with the little niche in the south transept, which is essentially French, having deep semi-Corinthian capitals, octagonal Abaci and roll moulding, such as one would rather expect to find in England in the latter part of the twelfth, instead of the thirteenth, century. It is a pretty little feature, and worthy of a measured drawing rather than a slight sketch, though these sketches have other value in giving an idea of concrete form, which is sometimes of greater importance than mere planned elevation. The arched sill will be noticed rather as a curiosity than as something to be copied, and is indicative of a vault beneath.

In the town itself are found a considerable number of old half-timber houses. Most of these are crowded into narrow streets; but one at a corner is sketched by everybody. The large over-hanging gable is essentially French, and is a feature found in many of the neighbouring towns, particularly at Caen, where there are several examples, and in other respects the work differs from any seen in England, particularly in the great use of light, short, diagonal timbers. In Kent for instance, light vertical timbers and

OLD HOUSE, LISIEUX. SKETCHED BY G. A. T. MIDDLETON.

long diagonals would be found, in our north-western counties the timber would be heavy and the panels cusped, while in scarcely any cases would the design be so broken up or so picturesque as in Normandy. Also as shown in the sketch there is a plain iron grille to these old houses of Lisieux, which is of interest, not from its beauty but for its great strength and the immense amount of labour expended in its manufacture; each vertical and each horizontal being alternately worked into

## OLD ENGLISH WOODWORK at Sizergh Castle and Levens Hall.

By E. P. MILNE.

IN connection with the measured drawings of woodwork given this week in one of our inset plates, the following details of the

surrounded by oak wainscot of very fine design, and said to be the best example of manœuvring of the Elizabethan period. The paneling is in two stages with a cornice, and divided into coupled compartments with paneled pilasters. The ornament is all inlaid in the solid, and consists of white holly and black oak on brown oak ground, with black panel in the intermediate pilasters, the whole giving a very rich effect. The original fine-paneled plaster ceiling, with pendants, and shields of arms, and figures of animals, still exists at Sizergh Castle, the ceiling at South Kensington being copied from it. My drawing was made some twenty years ago, from the room as then existed in the castle.

*Levens Hall* is the residence of Joscelyn Fitzroy Bagot, Esq., M.P., D.L., J.P. The mansion, which is of the Elizabethan period, was remodelled by James Bellingham, Esq., whose initials, J.B., and the date 1595, are carved in the upper panels of the magnificent oak chimney-piece in the drawing-room; this was illustrated in the BUILDERS' JOURNAL, August, 1897, in connection with the visit of the Architectural Association. The two staircases and details of panelling are excellent types of the woodwork of the period. In the dining-room there is a fine old oak chimney-piece with fluted pilasters, the upper portion being quaintly paneled and inlaid with black and white woods; this bears the date 1586. The walls of this apartment are covered with old embossed and gilded leather. There are also some very interesting types of lead glazing in the windows. Levens and Sizergh are only about four miles apart, so it is very probable that the work was designed by the same artist, the details in both cases are almost identical. My studies from Levens Hall were also made many years ago, but I have no doubt that the interior is in the same splendid preservation as it was then, and I can strongly recommend this grand old mansion as "a happy hunting-ground" to any architectural student who is interested in the best period of Old English domestic wood-work.

**A Memorial Tablet** to the forty-eight officers and men of the Northamptonshire Regiment who fell in the North-west Front campaign of 1897, was unveiled at All Saints Church at Northampton recently.

**Sewer Fatalities.**—Three men were killed at Wigan last week while cleaning out a sewage manhole. They were overcome by poisonous gas and suffocated. Last Wednesday, while a number of men employed by the Rochester Corporation were emptying a cesspool, a man named Edward White became unconscious, owing to the poisonous gas, and fell in. Another man, named Wright, endeavoured to rescue him, and also became unconscious. Both were got out, but White was dead.

**A Remarkable Competition.**—A committee, under the presidency of the Duke of Genoa, met at Turin last week to make the necessary arrangements for an international competition, having for its purpose the delineation of the head of Christ, either in sculpture, painting, or drawing. The dividable price for the best work is 3,000 lire, and all the works sent in will be exhibited on the occasion of the unveiling of the Victor Emmanuel monument at Turin in September next. The idea of the competition originated with the well-known painter, Carpanetto.

**Uniformity of the Pavements** of the Metropolitan streets was one of the subjects advocated at the seventy-fifth annual meeting of the Royal Society for the Prevention of Cruelty to Animals last Wednesday. In a report presented it was stated that at present time each vestry determines whether the carriage-ways within its own district shall be of granite, wood, asphalt, or macadam, and the result is that horses suddenly meet with dangerous consequences, from one to the other in the various thoroughfares. The Society does not state which material is best suited for animals, but only seeks great uniformity.

NICHE IN SOUTH TRANSEPT, LISIEUX CATHEDRAL. SKETCHED BY G. A. T. MIDDLETON.

a ring which the other passes through, there are no continuous rods from top to bottom or from side to side, and the whole forms a most solid cage, which almost looks as if the room to which it belongs had been used as a prison.

**Two new wings have been added to Dundee Convalescent Home**, which include two large day rooms, reading and writing rooms, two dormitories, and five additional bedrooms. The cost has been about £4,000.

**A Mill Dam Burst** at St. Andrews recently, and damaged a brick partition within a new sanatorium which has been erected for the St. Andrew's School for Girls Company, Limited. Some masons' lime pits, stones, &c., were washed away, and old fishcuring premises in the Pends were damaged.

**Death of an Aberdeen Architect.**—The death has occurred at Bridge of Allan of Mr. William Low Henderson, head of the firm of Messrs. W. Henderson and Son, architects, of Aberdeen. Mr. Henderson was seventy years of age, and his firm have since the Disruption been architects for many of the Free Churches in the North of Scotland.

buildings from which they are taken will probably be of some interest:—

*Sizergh Castle*, the ancient seat of the Strickland family, is a castellated mansion on the bank of the river Kent between Kendal and Milnthorpe, and was erected at various periods from the fourteenth to the close of the eighteenth century.

The castle now consists of a central block with side wings, thus forming three sides of a large courtyard. The earliest portion of the building is the tower. The rooms on the first floor were elaborately fitted up during the Elizabethan period, and comprise the drawing-room and a bedroom, known as the "Queen's Chamber." The drawing-room is wainscoted with oak panelling relieved by fluted and paneled pilasters, and has an elaborately carved mantelpiece with shields of arms, and the date 1564. On the second floor was the splendid apartment known as the "Inlaid Chamber," supposed to have been originally used as a banqueting hall. The "Inlaid Chamber," which measures about 24ft. by 19ft., was in later years used as a bedroom, and was until 1891 (when the panelling was sold to the South Kensington Museum for £1,000)

## Correspondence.

### OUR ST. PAUL'S CATHEDRAL PLATE.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, N.

SIR,—Surely your description of the engraving of St. Paul's Cathedral which you reproduce in your issue for May 31st, is inaccurate? You give the year of publication incorrectly.

It was published on May 27th, 1755, by the proprietors at the Golden Ball, in Little Court, Castle Street, near Leicester Square, price 12s., as may be seen at the bottom of the plate. As regards its interpretation, it is not easy to see how a section through both transepts looking eastwards can avoid showing the choir. Nothing is clearer than the interior of the eastern apse and the small altar supported on an eagle. Above that there seems to be a transparency of the Last Supper. Wren never made any design for the cathedral without a choir. The mere suggestion of such a thing is ridiculous. The design popularly called Wren's "original design" is shown facing page 110 in "The Three Cathedrals Dedicated to St. Paul," by W. Longman, F.S.A. (Longmans, 1873), and the succeeding plate, facing page 111, shows Wren's scheme for arranging the choir stalls and screen in the easternmost bay of this plan. There is as complete a choir arrangement in that plan as there is in the cathedral as actually built. F. C.

[Our correspondent is a trifle over positive. The engraving seems to have been published originally in 1755, but our reproduction was made from a later edition, dated 1801. Any one who will examine the original plan as published in Longman's book will see that this design may be described with rough accuracy as being "without a choir." There was, of course, accommodation for singers, and no doubt the eastern bay where this accommodation was provided would strictly speaking be called "the choir." The object of our note was simply to render intelligible the sectional drawing, which to readers unaware of the radical difference between the original and the present design might prove somewhat mystifying.—ED. B.J.]

### GAS STOVES FOR HEATING.

To the Editor of THE BUILDERS' JOURNAL.  
HUDDERSFIELD.

SIR,—Permit me through the medium of your valuable paper to call attention to the special suitability of gas heating stoves for vestries and classrooms in connection with churches, chapels, or schools. In many instances, the room is only required either before or at the close of the public services for the transaction of business matters in connection with various societies. Frequently, the verger or caretaker does not deem it necessary to light a fire, especially when it is contemplated the meeting will be a short one. In many cases, however, contemplated short meetings develop into long ones. It is anything but desirable to sit in a cold room. If a gas stove were available it could be lit at any time, and would render immediate service in the way of increasing the temperature of the room.

Considering that the principal gas undertakings in the United Kingdom supply and fix gas heating stoves free of charge for a few shillings rental per annum, the cost is not a matter for serious consideration, especially putting against the small expense the vastly increased comfort of those immediately concerned.

Gas stoves are peculiarly useful where a fire is only required intermittently as in the cases pointed out. An average sized stove will consume about twenty to thirty cubic feet of gas per hour, which would cost less than a penny. With careful usage the consumption is less. Possibly the suggestion may be of service in some instances.—Yours faithfully,  
EDWARD A. HARMAN, M.Inst.C.E.

## THE DISPUTE IN THE BUILDING TRADES.

To the Editor of THE BUILDERS' JOURNAL.

ST. HELENS.

DEAR SIR,—In view of the proposed conference between the representatives of the National Association of Master Builders and the delegates of the Allied Building Trade Unions, it is advisable for the representatives of the Master Builders to take note of the bricklayers' demands in St. Helens, Lancashire, for which the men came out on strike on June 1st:—

(1) Walking time to be allowed when starting at 6 o'clock, 7 o'clock, and 8.30 a.m.

(2) Breakfast, 8 o'clock to 8.30. Dinner, 12 o'clock to 1 o'clock.

(3) Employers to be responsible for men's tools where lock-up cabins are not provided.

I think the unreasonableness of these three demands needs little explanation. As to

(1) Why should the master be called upon to allow a man walking time after first starting, when he has to pay labourers to be there to attend to the bricklayers, and any failure on the bricklayers' part to be at his work at first start makes the labourers' wages a considerable percentage more costly than it should be?

(2) A demand is made for meal hours at a certain time, which if granted would leave an employer powerless in cases of emergency, viz., in many places where an employer is called upon to do a job which may be very important about machinery, which machinery might be stopped at these certain hours, a master could not do the work without the sanction of the men's union. Instances have been known when men have been stopped all morning for rain up to 11.30 and 12 o'clock, and although the men have brought their meals on the job, and eaten them while waiting for the rain to clear off, they have been prevented from commencing work before 1 o'clock, although they have lost all the morning, because their rules stated they should have between 12 o'clock and 1 o'clock for dinner.

(3) If this was adopted it would be impossible to tell where a master's responsibilities would end.

I think the Masters' representatives ought to draw up their resolutions so as to protect local associations from having these demands to contend with.—Yours truly,  
THOMAS WOODS.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

BATTERSEA, S.W.

SIR,—Kindly allow me through the medium of your influential paper to call attention to the limitations to that liberty of action, the pride of every Englishman, which is seriously threatened in the Bill for the Registration of Architects.

It is claimed that this Bill will raise the status of the architect in the eyes of the public, but should it not also aim at demanding greater efficiency from its members and debar those who are incompetent to superintend the construction of their own designs from practicing? As far as I can see there seems no promise or likelihood that the General Council which it is proposed to appoint will substitute radical changes in the present method and subjects in which candidates will be examined.

I have often wondered in what a hopeless muddle many architects would find themselves if the builder constructed the erection exactly according to their plans as originally placed in his hands, and withheld that advice and those suggested alterations in many details of the construction, without which the building could not be successfully completed. Yet I suppose if the Master Builders' Association had the power granted to them by Her Majesty to appoint several of their members to that general council their presence would be considered derogatory to the profession. Yet there is no doubt that a great improvement would be effected, and

much that is now theoretical would be replaced by that which is really practical; the staircases then designed would allow a man of ordinary height to walk to the top of them in an upright position, instead of crawling upon his hands and knees through a space of two or three feet when he got to the top; windows would then be designed with frames; timber would be specified in sizes which are actually imported and obtainable in this country, and also not be, as at times, specified entirely without knots, sap, or shakes.

No matter how well qualified a man may be by the possession of sound practical knowledge obtained by years of actual contact with work, and even should he possess artistic genius in addition, when this Bill comes into force he will be liable to heavy penalties should he call himself the architect of any building he may have designed and whose erection he may have superintended, and he will be unable to enforce the payment for any fees for the services he has rendered. Whereas, upon the other hand, a boy would be eligible who had been for a short period under the tuition—*sic*—of another certificated man, probably a blind leader of the blind, possessing in many cases no other qualification than a very superficial knowledge of the rudiments of the theoretical part of his profession, and with such a small practice, that the number of practical examples he could place before his pupils could be counted upon one's fingers. Yet after this course he would have every advantage denied to the practical man above referred to, and would be eligible for any public appointment after being branded with the trade mark of this architectural Trades' Union in which all members are equal and all receive the same rate of pay. Yet the Bill wisely specifies that this new brand of architect shall have studied three whole years and shall not be less than twenty-one years of age when this exalted title shall be conferred upon him, which would certify that he possessed all the knowledge necessary to instruct and correct one who, like myself, had studied the actual carrying out of work for over thirty years. The granting of this certificate to such a prodigy is surely not sufficient; the members of the council appointed by Her Majesty's Privy Council should request her to grant him letters patent!—Yours faithfully,

BUILDER and CONTRACTOR.

To the Editor of THE BUILDERS' JOURNAL.  
GLOUCESTER.

DEAR SIR,—Having read Mr. H. T. Bonner's letter of the 24th ultimo upon the subject of Registration, we specially note that portion relating to the treatment received by pupils.

We, the undersigned, can fully endorse his views upon this matter. We trust that you will oblige by inserting this in your valuable columns.—Yours obediently,

THREE PUPILS.

To the Editor of THE BUILDERS' JOURNAL.  
ST. JAMES'S HALL, PICCADILLY, LONDON, W.

DEAR SIR,—Your editorial on "Birthday Honours" in your last issue suggests one of the strongest arguments in favour of registration.

The reason of the lack of titular honours among members of the architectural profession is undoubtedly the result of its individual members, of however high standing and ability, having to share the drawbacks attaching to the profession as a body, for while honours of all kinds are scattered broadcast in the legal and medical professions, architecture has, we believe, only one knighthood, and, until we are recognised by the State and our profession closed to incompetence, we cannot expect that those in high place will recognise the claim our leaders have to the rewards of merit so freely bestowed elsewhere.

Yet the remedy is obvious. Let these latter take up the question of registration, and by their personal influence secure to the profession a legal standing.—Yours faithfully,

C. MCARTHUR BUTLER,  
Secretary, the Society of Architects.

## Views and Reviews.

### SKETCHES IN THE RIVIERA.

The Fine Art Society have now on view a collection of water colour drawings by Arthur Berrington, R.I., illustrating a season on the Riviera. The treatment of the different subjects varies very much; some of the drawings, such as Nos. 17 and 20, are elaborate pictures with much work in them, while others are the merest sketches. The value of the pictures seems also to be as variable as the treatment. On the whole it is a collection of bright, vivid, transcriptions of the brilliant atmosphere of the south, in which this atmosphere, if not always faultlessly rendered, is generally well suggested.

In one or two of the sketches this brilliancy has been rather overdone, which gives an effect that is, perhaps, gaudy, violent, and unpleasant, such as in No. 43—"King Carnival." In pleasing contrast to this is No. 46—"Where the Torrent Joins the Sea"—cool, grey, and restful. We think the painter has been most successful in the simpler sketches, where the effect has been obtained quickly and directly, such as No. 39—"On the High Road"—which contrasts favourably with No. 27—"Drying Sails," which is laboured and "faked up." Of the more elaborate drawings we like No. 20—"Place du Casino, Monte Carlo"—and No. 55—"Le Berger"—which seems in the treatment of the Shepherd and Tree to be a good attempt at something in altogether a bigger style. On the whole one can hardly say that these drawings are of first class interest or importance—both in drawing and colouring the artist seems uncertain—and it is doubtful whether they merit the dignity of a "one man show," but they are evidently done with a certain enthusiasm for, and appreciation of the subject—Nos. 16, 21, 34 and 42 are charming subjects—and they interest us accordingly.

### ACADEMY PICTURES.

In spite of all the shortcomings of the Royal Academy its annual exhibition remains, for the great majority of people, the most interesting Art exhibition of the year. We hear doleful reports every year of the poor quality of the work shown, and we do not deny that the pessimistic critics have much ground for their complaints. Yet, in spite of all that can be said, there has not yet been an Academy which did not contain a considerable number of genuinely beautiful works of Art, works that deserved not only to be carefully examined, but to be remembered. The best means we know of preserving in the mind the recollection of the pictures one has seen at the Academy is supplied by Messrs. Cassell's "Royal Academy Pictures." We do not wish to imply that this publication merely serves the purpose of a mnemonic. The five parts when bound together will form a sumptuous volume, which many who are unable to attend the exhibition at all will like to possess, for these illustrations represent the high watermark of "process" reproduction. Seeing that their appeal is to a wide public, not merely to a few art connoisseurs, it would be hypercritical to object to the inclusion of a certain number of pictures that no one ought to wish to see a second time, or to the exclusion of all examples of architectural art. The multitude, as we all know, take no interest in Architecture, and Messrs. Cassell cater for the multitude. For those who care for architecture, are there not the supplements to the "Architectural Review?" These and the "Royal Academy Pictures" together form the most complete and satisfactory souvenir that can be procured of the Academy for 1899.

"Royal Academy Pictures." In five parts, 1s. per part. Cassell and Company, Limited: London, Paris, New York and Melbourne.

### FOR ART TEACHERS AND STUDENTS.

It is hoped that the issue of these portfolios may be continuous, for the matter must be inexhaustible. The institution of the Technical Education Fund has led to there being

schools of design all over the kingdom, and these illustrations of art should be part of the furniture of every such school. The teachers, it should be remembered, have even more need of instruction than the pupils themselves, and the aim of the said schools of design being to provide instruction in every department of decorative art, a series of illustrations drawn from the best of the past cannot fail to be exceedingly valuable.

The sheets contained in these portfolios are unbound, and unrelated as to the subject matter; but there is wisdom and forethought in this apparent indifference to order, for it would not do to have each part so complete as to exhaust a particular subject; if it were it would be impossible for the series to maintain its even, deliberate course, and one can imagine the publisher saying: "Let the whole be subscribed for; the parts arranged afterwards." It is not supposed that there will be a very extensive demand for such things in the household, but the tendency is to think more of municipal than private establishments, and it is for the schools of art that they are provided. The writer, to make his point clear, must be allowed to suppose himself an art master. He would certainly require, if he were, to be supplied with all the parts of this publication, and would arrange the plates in such wise that they might at all times be shown to the students of any particular art or its history.

By permission of Messrs. Longmans we reproduce in our inset plates this week two examples taken from the first two portfolios that have been issued.

"Selected examples of Decorative Art from South Kensington Museum." Edited by F. E. Witthaus. Longmans Green and Company, 39, Paternoster Row, London.

### RURAL SANITATION.

Within the last three years our contemporary, "The Lancet," has conducted an interesting investigation into the relative efficiency and cost of house drainage; and the best means of providing a pure water supply and satisfactory sewage disposal for country residences. The reports of the special commission appointed to carry out the inquiry are now reprinted from "The Lancet" in convenient book form.

The first part of the volume refers to the construction and cost of plumbing and drainage work. Three examples are given for the purpose of illustrating the most common and dangerous sanitary defects found in ordinary houses. They include complete drainage plans of two terrace town houses, and a small suburban villa; each indicating the existing insanitary lines of drainage and positions of the old fittings. Corrected plans, showing an entire reconstruction of the work, and exhaustive reports upon the sanitary condition of each house are then given. These are accompanied by full particulars as to the best means of remedying existing defects, sketches of sanitary fittings, together with estimates of the cost of the alterations.

Exception might be taken to a few matters of detail and construction which are recommended in the examples described, but they are comparatively unimportant, and do not call for special notice. Some of the prices quoted are also rather high in these days of excessive competition, and in accepting them as a basis, it must always be borne in mind that the market value of materials and labour is continually fluctuating, especially for plumbers' work, where the current price of lead is necessarily an important factor.

It cannot be denied that the typical plans and particulars here brought under observation, would actually represent—in a greater or less degree—the very insanitary condition of many large town and country residences. If such a state of affairs could only be realised by the average owner and occupant, steps would soon be taken to remedy such grave defects at all costs.

The second portion of the work deals with water supply, drainage, and sewage disposal in connection with houses situated in rural districts. The various methods of obtaining a pure water supply, and the most approved

means of sewage disposal by the dry earth system, irrigation, precipitation, and biological filtration, are well described and illustrated.

The provision of an economical and efficient system of sewage disposal for a large country residence is often-times a very difficult problem to solve. This portion of the subject has accordingly received the most careful consideration. It is assumed that indoor closets and other modern sanitary conveniences are a necessity, so that the water carriage system of drainage must be applied to the mansion. The entire separation of rain and surface water is rightly insisted upon, in order that the total quantity of sewage may be as small as possible. A storage tank is provided for the rain-water, whilst surface water is discharged into a pond or ditch. The disposal of the sewage is effected by means of a "Scott Moncrieff" cultivating tank, the effluent being discharged upon a plot of prepared land. With ordinary attention this system would prove quite successful. For cottages and houses of medium size in rural districts, the Commission arrived at the conclusion that nothing more simple or economical than the old fashioned dry earth system—or Dr. Poore's modification of it—can be adopted.

We heartily recommend the book to all who are interested in the construction and maintenance of healthy dwellings; for it does not consist merely of a number of plans and suggestions, but a clear and concise statement of the principles underlying each phase of the subject is given. At the same time it furnishes an excellent object lesson on the method of making a systematic and comprehensive sanitary inspection and report; and for this reason possesses a distinct value to architects and others professionally engaged on works of similar character. Such distinguishing merit, combined with its moderate price, should insure for this book a wide circulation. T. E. C.

"Water Supply and Sewage Disposal in Rural Districts; and Plumbers' Work in Its Relation to Town and Country Houses." Price 1s. "The Lancet" Offices, 423 and 424, Strand, W.C.

### A WATER-COLOUR INDICATOR.

This indicator is a handy companion for the student of water-colour painting. It consists of a single sheet of thick drawing paper, and is coloured with pure water-colour pigments. It is arranged in the form of a semi-circle, divided into three angular divisions, each one-sixth of a circle. These are again divided into five by semi-circular divisions proceeding from the centre of the circle. The lower three angles at the base are coloured by the primaries,—red (rose madder), yellow (gamboge), and blue (French blue). Above these are arranged the secondaries, purple, orange, and green, formed by the combination of the primaries. In the next series are the tertiary tones, brown, olive, and grey or slate, formed by the combination of the secondaries, thus making them combinations of all three primaries. The two outside rings consist of twenty-one compartments, showing combinations of the sixteen pigments: Vandyke brown, sepia, brown madder, burnt sienna, raw sienna, ivory black, terra verté, Prussian blue, French blue, indigo, cobalt, vermilion, light red, rose madder, gamboge, and yellow ochre. We think that this chart could have been considerably improved by the arrangement of the tertiaries on an easier system for the young student to understand. Thus it might have been shown in which tertiaries the colours were balanced, and which were dominated by the primaries and secondaries. The theory of colour decoration has almost entirely changed within the last few years, and there are still many debatable points to be cleared up. Black and white were once thought not to be colours, but white has been shown by spectrum analysis most certainly to be one. So our theory of colouring will doubtless be further modified at no distant date. But, still, such a chart as this is of undoubted use to the architectural draughtsman and art student.

"The Water Colour Indicator." By Frederick Oughton. Price 3s. 6d. nett. London: George Philip and Son, 32, Fleet-street, E.C.

## R. I. B. A.

## BUILDING BY-LAWS: REPORT OF THE COMMITTEE.

AT the meeting of the Royal Institute of British Architects on Monday last, the following gentlemen were elected as Fellows:—Messrs. George Frederick Bodley, A.R.A., Edwin Arthur Johnson, George Augustus Bligh Livesey, Edwin Arden Minty and Andrew Murray. Mr. Jasper Wager was elected as an Associate, and Comte Paul de Suzor, of St. Petersburg, as an Honorary Corresponding Member.

The following report, submitted by the Special Committee appointed by the Council to consider the Administration of Building By-Laws in non-Metropolitan Districts, was then received and considered:—

The committee have considered the present condition of building by-laws in England outside the County of London, and their administration.

Some of the larger municipalities are governed in these respects under private Acts of Parliament, but the great majority of boroughs and urban districts have adopted by-laws under the Public Health Acts which have been confirmed by the Local Government Board, and they are for the most part founded on, though they do not absolutely follow, the model by-laws issued by that board.

Around some of the larger centres of population there are urban districts which have obtained the sanction of the Local Government Board to building by-laws varying in several particulars from the model by-laws and from one another. This want of uniformity in districts closely adjacent causes inconvenience and irritation to building proprietors as well as to architects.

It is within the powers of rural sanitary authorities to apply for and obtain from the Local Government Board "urban powers," which have been freely granted. They can then adopt the whole of the model by-laws.

When adopted the by-laws become operative not only in that part of the district which is crowded, but also in its suburbs and outlying districts; and thus a rural district, often extending for miles round the large village or small town which forms its centre, has just the same building regulations as a crowded town.

It is the experience of the Committee that some of the by-laws thus introduced are not well adapted for general use throughout the country, and when applied in connection with ordinary buildings over large areas of a purely rural character, they become oppressive.

The enforcement of unnecessary regulations in respect of matters in which the public has no practical interest seems to the Committee an improper interference with the liberty of the subject.

It gives useless trouble to local authorities. It multiplies undesirably officials to be paid out of the rates.

It adds unreasonably to the cost of building. It promotes monotony in design, stultifies invention, and prevents improvement.

It occasionally stops building. More particularly it discourages the erection of cottages for the labouring classes by landed proprietors on their country estates.

Recognising the necessity for such building by-laws as are proved to be essential to the safety or health of the public, and desiring that the by-laws relating to the same subject should, as far as practicable, be alike throughout the country, the Committee suggest that the model by-laws should be grouped in divisions as detailed below, in order that buildings in rural localities may be relieved from those divisions which appear inapplicable in such places. In an appendix they deal in detail with each division so far as amendment appears to them needed therein.

## Suggested Divisions.

A. Definition of Terms and Exempted Buildings [Model By-laws 1 and 2].

B. New streets [3-8].

C. Space about Buildings and Area of Windows [53-58].

D. Structure of Party Walls [25-32].

E. Structure of Walls, Foundations, Roofs and Chimneys (11-23, 33, 34, 36-52].

F. Sanitation, Preparation of Site, and Drainage [9, 10, 17, 52A, 60-89].

In rural districts the committee consider that A, D and F would suffice. It might be desirable to add B in the case of any part of a rural district likely to become urban.

Possibly E might be added, to apply only to large public buildings, warehouses, and factories of considerable height. Ordinary shops should not be regarded as other than domestic buildings.

In towns where a competent building surveyor of experience is engaged the whole of the by-laws should be in force. In such places exemptions from certain divisions of the by-laws should be made applicable to particular buildings rather than to districts. The committee are of opinion that in no case should the exemptions extend to sanitary matters. The exemptions they suggest are set forth in the Appendix, Division A, No. 2.

It appears to the committee that no model by-laws can be considered complete which do not include those to be enforced by local authorities with respect to the staircases and exits of public buildings and factories, even though authorised otherwise than under the Public Health Acts.

It is of great importance that the requirements of the local authorities as to the deposit of drawings should be reasonable, and that they should be explicitly stated. The committee suggest that in all cases a block plan, with the lines and depths of drainage shown thereon, together with the nearest public roadway and adjoining premises within 100ft. of the proposed building, should be deposited, and that, where required, plans and sections (together with elevations, if needful to explain methods of construction) should be submitted for inspection during a defined and limited time; which drawings should be then returned, stamped, if approved, or, if not approved, accompanied by a precise statement of the particulars in which the by-laws have not been complied with.

It would be of great advantage if an appeal could be provided to a technical authority as to the meaning and applicability of by-laws.

The Committee have the honour to lay this report, with the Appendix, before the Council of the Royal Institute of British Architects, and request that it may be submitted to a General Meeting.

It might be well to forward copies to the Allied Societies, for their consideration, before the Meeting is called.\*

On the report being adopted, the Committee suggest that the Institute should request the Local Government Board to receive a deputation, whose objects would be to point out to the Board the desirability of altering some of their Model By-laws and arranging them in divisions, and to request the Board to take such steps as may be necessary to bring the new method of administering the By-laws before the notice of the local authorities.

The influence of those who are interested in building would have to be brought to bear upon the local authorities to urge them to give effect to the proposed measures of relief by adopting such, and such only, of the divisions of the By-laws as would be applicable to their districts or to different portions thereof.

## Synopsis of Model By-laws as Issued by the Local Government Board.

No.	Division.
1.	Interpretation of terms See Appendix, A.
2.	Exemptions ... See Appendix, A.
3-6.	New streets. Retain...
7.	New streets ... See Appendix, B.
8.	New streets. Retain ...
9, 10, 10a, 10b.	Sites. Retain
11, 12.	Walls ... See Appendix, E.
13-16.	Walls. Retain ...
17.	Damp course ... See Appendix, F.

\* Copies of this report have been sent to the Allied Societies, and their opinions invited thereon, according to the suggestion of the Committee.

18, 19, 20, 21.	Walls ... See Appendix, E.
22, 23.	Walls. Retain ... E.
24.	Wood in external walls. Omit.
25-32.	Party-walls ... See Appendix, D.
33, 34.	Support of timbers. Retain ... E.
35.	Brick nogging. Omit.
36-51.	Chimneys, &c. Retain ... E.
52.	Roofs. Retain ... E.
52a, 60a.	Water on roofs, &c. See Appendix, F.
53, 54.	Open spaces ... See Appendix, C.
55, 57.	Windows ... See Appendix, C.
	Height of storeys. Omit.
56.	Ventilation under floors. Retain ... C.
58.	Ventilation of rooms. Retain ... C.
59.	Ventilation of public buildings. Omit.
60.	Subsoil. Retain ... F.
61-64.	Drainage. Retain ... F.
65.	Drainage ... See Appendix, F.
66-79.	Drainage. Retain ... F.
80-85.	Ashpits. Retain ... F.
86-89.	Cesspools ... See Appendix, F.
91, 92.	Notices and plans ... See Report.

## APPENDIX.

## DIVISION A.—DEFINITIONS AND EXEMPTIONS.

## Interpretation of Terms.

No. 1\*.—Terms defined by the Acts under which the By-laws are made should be inserted here for general information.

"Base" of a wall carried on a bressummer should mean the course above the bressummer. See London Building Act, 1894.

"Topmost storey" should be defined to include a one-storey building.

As far as possible the interpretations should accord with the London Building Act, 1894.

## Exempted Buildings.

No. 2.—It is undesirable that any buildings should be exempt in practice from supervision respecting sanitation and drainage; certainly not railway stations.

No. 2 (h) (i) (j).—To be substituted for Model By-law No. 2 (h) (i) (j).

The following buildings to be exempted from all By-laws excepting Division F. (Sanitation, &c.).

(h) Any building, not being a Public Building or Factory (or which, being a Public Building or Factory, is one storey only in height, and is without any gallery), which is situated not less than 15ft. from the boundary of the curtilage thereof.

For the purposes of this by-law two domestic buildings shall be regarded as one building provided they are separated by a party wall in accordance with Division D.

NOTE.—This is not intended to exempt any Public Building or Factory from By-laws regulating Exits and Stairs, should such By-laws be introduced.

(i) Any building situated within 15ft. of the boundary of the curtilage, which is distant 15ft. at the least from any public way and from any other building within the curtilage, and does not exceed 600 superficial feet in area nor 15ft. in height, provided that its external or party-wall towards the boundary of the curtilage is constructed as provided for a party-wall in Division D.

(j<sub>1</sub>) Greenhouses if not attached to other buildings (see London Building Act).

(j<sub>2</sub>) Greenhouses attached to other buildings so far as regards the necessary woodwork of their sashes, skylights, doors, and frames.

## DIVISION B.

No. 7 (c).—Suggested amendment:—He shall construct on one side at least of such street a footway not less than 6ft. wide.

## DIVISION C.

No. 53.—Omit 53 in favour of 53A.

No. 54.—Add to 54 and its provisos Section 41 of the London Building Act, part of Sub-section i., modified thus:—

Where there is a basement storey directly and insufficiently lighted and ventilated, or where the basement storey is not constructed or adapted to be inhabited, or where there is no basement storey, and where the ground storey is not constructed or adapted to be inhabited, the open space required by this

\* These numbers refer to the Model By-laws.

section may be provided above the level of the ceiling of the ground storey or a level of 16ft. exclusive of lantern lights, measured from the level of the adjoining pavement.

Section 52 of the London Building Act should also be introduced in the following form:—

In the case of domestic buildings and stables or other dependent buildings abutting in the front upon a street and in the rear upon a mews or public way, the sufficient open space provided for the domestic building shall serve also for the stables or dependent building.

It might be desirable to introduce Section 45 London Building Act respecting "Courts within a building."

No. 55.—Suggested amendment: Every person . . . shall construct . . . suitable windows in such manner that effectual means of ventilation by direct communication with the open air shall be provided for every habitable room of such building.

NOTE.—It is not desirable that the heights of storeys should be arbitrarily fixed by By-laws.

#### DIVISION D.—PARTY-WALLS.

Such parts of Nos. 19, 20, 21, and 22 as relate to party-walls, and Nos. 26, 27, 28, 29, 30, 31, and 32:—Every wall built for the separation of adjoining buildings belonging to different owners or occupied or adapted to be occupied by different persons shall be constructed of good bricks, stone, or other hard and fire-resisting material, properly bonded and solidly put together with good mortar.

Such wall shall in no part be less than 8½ in. in thickness. It may, however, be divided into two thicknesses of 4½ in. by a flue, provided that such flue be pargetted and has an opening into one only of the adjoining premises.

Such wall shall extend from the foundations or footings up to the underside of the incombustible roof covering, and shall be built or properly corbelled out to the full extent of any projecting string, eaves, or other architectural feature any part of which within 3ft. of the party-wall is constructed of wood or other combustible material.

It shall also be carried up the full width and height of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4ft. of the party-wall is constructed of wood or other combustible material.

No timber shall be built into or placed in any party-wall nearer than 4½ in. to the centre line thereof, nor within 9 in. of the inside of any flue or chimney opening, nor within 7 in. of the upper surface of any hearth; nor shall any wooden plug be driven into any such wall nearer than 6 in. to the inside of any flue or chimney opening.

Such wall shall in each of the following cases be carried up above the roof or flat or gutter of the highest building adjoining thereto to such height as will give a distance of at least 15 in., measured at right angles to the slope of the roof, or above the highest part of any flat or gutter, as the case may be, and shall be properly coped and protected from water soaking into the wall.

(a) When either of the adjoining buildings has a roof not externally covered with slates, tiles, metal, or other incombustible material;

(b) When either of the adjoining buildings exceeds 30ft. in height, measured from the lowest part of the ground-floor storey to the tie of the roof, or to halfway up the gable if the roof has no tie;

(c) When either of the adjoining buildings is intended or adapted to be used as a public building or as a warehouse, factory, or workshop.

When either of the adjoining buildings is of the class described under (c) and exceeds the dimensions described in (b), the walls shall be carried up for a distance of 36 in. above the roof, flat, or gutter, as the case may be, and shall also extend 12 in. higher and wider on each side of any turret, dormer, lantern light, or other erection on a roof or flat any part of which within 4ft. of the party wall is constructed of wood or other combustible material.

#### Buildings Adjacent to the Boundary of the Curtilage Thereof.

No. 25.—When the external wall of a new building is within 7ft. 6 in. of any boundary of

the curtilage other than a public road, the wall shall be built of incombustible material, and no timber or other combustible material shall be fixed beyond the face of such wall.

#### DIVISION E.—STRUCTURE OF WALLS, &c.

No. 11.—Add:—Any storey in a roof, and the storey immediately below the roof not being the ground storey of a detached or semi-detached domestic building, may be inclosed with timber studding, not less than 4 in. thick, properly framed, covered externally with weather-tiling or plastering, and internally with plaster work covering the whole surface excepting the necessary openings. Such inclosure, when properly corbelled out, may overhang the wall below, provided the soffit be plastered.

Add to No. 18 (iii.):—A pier not less in width and breadth than twice the thickness of the wall as defined for each storey, and standing on a solid foundation, shall be deemed to be a return wall for the purposes of measuring the length of walls.

Nos. 19 and 20.—Omit "and every party-wall," and add in both cases:—The minimum thickness of every party-wall shall be 4½ in. less than that prescribed for an external wall of corresponding height and length, but in no case less than 8½ in.

Add to 19 (not 20):—Where the wall of any domestic building, hereby required to be 13½ in. or more in thickness, is covered externally with tiles or other similar incombustible and impervious material securely fastened thereto, the said thickness may be reduced by 4½ in., provided that such reduction shall not be made on more than one storey nor on any ground story nor on any storey exceeding 10ft. in clear height.

No. 24.—Omit 24. See Sec. 55, London Building Act, 1894.

No. 35.—Omit. There is no corresponding rule in the London Building Act, 1894.

No. 52a.—Omit. See Division F, substituted by-law.

#### DIVISION F.—SANITATION, PREPARATION OF SITE, DRAINAGE.

No. 17.—Substitute "floor" for "timbers" in line 5. In the second paragraph a vertical damp-course should be substituted for the hollow wall described.

Nos. 52A and 60A.—Substitute the following:—Every person who shall erect a new building shall make suitable provision for carrying off the rain-water from the roofs, flats, gutters, and areas in such manner as not to cause dampness in any part of the walls or foundations of such building or any adjoining building.

No. 65.—It should be made to appear that this applies only to foul drains.

Nos. 86 to 89.—The provisions respecting cesspools are unpractical and unsatisfactory. The question of the disposal of sewage where no sewers are available requires reconsideration under modern conditions.

**A Gift to Paisley Infirmary.**—Mr. Peter Coats, of Garthland, offered to provide an infectious diseases block, and the directors have unanimously decided to accept the gift. Plans prepared by Mr. T. G. Abercrombie have been passed. They show a two story building, divided on the ground floor into two wards (each accommodating three beds) intended for male and female patients respectively. Bath room and kitchen accommodation and nurses' bed rooms are also provided.

**The Original Bridge over the Bannock.**—In the course of taking down an old building in the village of Chartershall, near Bannockburn, recently, the workmen found an interesting stone with the following inscription:—"This bridg was built by the Justic of Peace of Sterlingshyer, ano. 1696." The stone evidently formed the date stone of the original bridge over the Bannock, which, like so many others, was destroyed during the rebellion of 1745. The present bridge bears the date 1747, when it was rebuilt by the Justices of the Peace.

## Bricks and Mortar.

June 14th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

#### An Opportunity.

No one can say that Charing Cross Station is beautiful; it is a huge, smoke-blackened span of iron and glass piled on the top of brick arches, and dropped down in the middle of the fine curve of the embankment. It spoils a splendid view of the important buildings which reach from Westminster to Blackfriars and face the river. An opportunity for doing away with this eyesore has occurred. The South-Eastern Railway Company wish to increase the width of Charing Cross Station, but by an old Act they are not allowed to do so unless they proportionately increase the dimensions of the forecourt of the station on the Strand side. This provision they want Parliament to set aside, on the ground that the cost would be prohibitive. We hope Parliament will not agree to do so. There does not seem to be any reason why the South-Eastern Company should have their West End station on the north side of the Thames at all. The South-Western Company manages very well with Waterloo, and the South-Eastern would be in an even better position, since it already has its line to Cannon Street, and it would be merely necessary to build a large station on the south side of the river, and sell the valuable site of Charing Cross, when buildings could be erected which would harmonise with the present surroundings. The removal of the present South-Eastern railway bridge would make it possible to erect a stone bridge with some architectural pretensions connecting Northumberland Avenue with the Surrey side. What a relief it would be to see the splendid sweep of the Embankment from Westminster to Blackfriars unbroken by the hideous bridge and blackened girder roof of the South-Eastern station.

#### To Improve London.

A LIST of six improvements, estimated to cost £1,565,000, was before the London County Council yesterday. This list has been prepared by the Improvements Committee, and they recommend that Parliamentary powers should be sought next session. The first relates to the extension of the Thames Embankment between the Houses of Parliament and Lambeth Bridge, and the improvement of the district near Millbank. It is proposed that the course of Abingdon Street and Millbank Street shall be altered, and a new street 70ft. wide be formed. By the recoupment resulting from the alteration of the line of Millbank Street, and from the acquisition of the property between the street and St. John's Church, it will, in the opinion of the committee, be possible—to embank the river, to extend the Victoria Tower Garden, to widen Millbank Street, and to widen the other streets up to St. John's Church, including a portion of Horseferry Road, at a cost of £530,000, as compared with £306,000 for the imperfect and unsatisfactory scheme of merely widening the existing Millbank Street, and £498,000 for

both widening and straightening the street. The second scheme is for the much needed widening of Mare Street, Hackney, to 70ft. wide, between the North London Railway and the Triangle. The total net cost is £577,100. The third scheme is to widen Goswell Road to 60ft. between Upper Ashby Street and Great Sutton Street at a net cost of £209,500. The widening of Nine Elms Lane to a maximum of 60ft. is the fourth suggested improvement. This is to be between Southampton Street West and Battersea Park Road, and the net cost of the scheme is £136,400. The fifth project concerns Camberwell Road, which is to be widened between Warner Road and Camberwell Green at a net cost of £52,000. The last improvement on the list is a small widening of Kentish Town Road.

### The L.C.C. and its Architect.

THE following paragraph appeared in the "Globe" the other day:—"It is hinted that there is a likelihood of further disclosures in connection with the Works Department and the jobs it has recently been carrying out. The purport of rumours current is that not only have estimates been exceeded, but that, moreover, according to a report of the recently-appointed architect, the work is not so satisfactorily executed as it would be under contractors. The architect is credited with having the courage to maintain his opinions, in spite of discouragements and opposition from friends of the Labour party and supporters of the Works Department." It is, perhaps, advisable not to attach too much importance to such a rumour. The "Globe" is notoriously hostile to the Works Department and all its ways.

### Birmingham Students' Work.

THE exhibition of students' work at the Birmingham Municipal Technical School reflects considerable credit on that institution. The students are divided into two sections. Those in the day section are youths of school age; and those in the evening classes include a large number of apprentices and a good many adult workmen, whose studies are directed with the object of extending their acquaintance with the trades with which they are associated. The exhibition covers the work of both sections, and, as would be expected, the first section is of an elementary character; but in the latter the exhibits include products of which experienced workmen might be proud. Lead embossing, brass work, and carpentry are interesting departments, and much artistic work has been executed by the students. In the electric jointing department every known method of conjunction is taught, and the results obtained evidence keen intelligence and skill. The metal colouring done by some of the students is very commendable. In the engineering department a model of the 100ft. truss of Christ Church, which was discovered in dismantling that building, is included. Numerous drawings by students illustrate the scope of the school's work, and show that a large measure of success has attended its efforts.

### A Patriotic League.

WE have received an appeal from the Secretary of the British Mercantile League, which exists for the patriotic object of "preserving this country's commercial greatness." "The League proposes, as occasion offers, to take up any question affecting the prosperity of British industry in relation to the foreign competition which is growing more keen every day. In order that its work may be effective, it is essential that the League receive wide support throughout the country, not only from merchants and manufacturers, whose interests are directly affected, but from all citizens of the Empire who are willing to aid in righting a great Imperial wrong. Now is the time, when, if ever, all Britons should pull together to maintain our Empire's threatened commercial supremacy, and fair play, like charity, should begin at home. The Executive

Committee therefore appeal to all who are interested in their country's commercial well-being, and everyone in the country is either directly or indirectly interested in the matter, to join the League and help the furtherance of its great object. Prospectuses and all information may be obtained from the Secretary, at the League's offices, No. 68, Wool Exchange, London."

### Studio Bogies.

SIR WYKE BAYLISS was quite fatherly in his manner towards the students at the annual meeting of the Royal Architectural Museum and Westminster School of Art last Thursday. He warned them against the bogies which, he declared, haunted the studio. There was the bogy of the common-place, and he urged artists to remember that they should get more into their pictures than they could find in their paint boxes. All art worthy of the name began in paint and ended in passion. The artist should not only be a seer but a revealer. Another bogy was the one which would fain persuade a man that he was an artist because he knew something about technique, or had an appreciative mind for the beautiful. A third harped on the word "pot-boiler" till many an artist lost interest in his work because he had come to regard it as purely commercial. Painting a picture for money was not degrading; most of the finest work in the world had been done with a keen eye to the financial result. In conclusion, Sir Wyke said that "the greatest bogy of all" was the one which persuaded the artist that "the golden age" of art had passed away, never to return.

### A General City Exchange.

A SYNDICATE consisting of the representatives of the leading City of London firms engaged in various branches of trade was formed last week with the object of erecting an extensive building, which, it is proposed, shall be known as the City of London Exchange. It has long been felt that the Royal Exchange, which is practically a public thoroughfare, is totally unsuited as a meeting place for the thousands of merchants who are daily engaged in the City of London. There have been numerous small exchanges intended for the convenience of particular branches of trade, but no common house where principals and representatives might meet for business and social engagements. Mr. Ernest Forwood, of Messrs. Forwood Bros. and Co., of London, Liverpool, and New York, has recognised this want, and has been very energetic in bringing the movement into a definite form. The result is that a site has been acquired for the building in Jeffery Square, St. Mary Axe, within a short distance of Leadenhall Street, and therefore easy of access from the busiest parts of the City as it has developed in recent times. The structure will be of noble proportions, covering an area of 27,500ft. It will contain a large central exchange, approached from an extensive covered courtyard, as well as a clubhouse. It is anticipated that the cost of the new Exchange will be not less than £250,000 (the capital being £275,000), and construction will commence as soon as the design can be completed.

### Batley's White Elephant.

A GREAT deal of commotion has been raised over the question of removing the Batley Market Hall, commonly known as "the white elephant on the hill." It seems that for some time past the Batley Corporation have been discussing whether a new Town Hall should be built, worthy of the dignity of the borough, and at last the members talked themselves into agreement, when it only remained for the Town Council to confirm the proposed erection. This was done at a meeting of that body last Thursday, and it was also decided to apply to the Local Government Board for sanction to borrow £35,000 for the erection of the building. The scheme comprises the removal of "the white elephant," the levelling of what is now the hill, and the erection on the lowered

site of an imposing town hall, to cost the sum mentioned above. Messrs. W. Hanstock and Son have prepared the plans, which show a building that will be dressed in ashlar and lined with best bricks. The whole of the front entrance, together with the lobby and staircase, will be in decorative polished marble, and there will be plenty of cast plaster work on view. Tesselated tiles will give tone to the floors, and polished woodwork will be used in all the principal rooms. There will be a well-equipped police-court, and spacious offices for the town clerk, building inspector, medical officer, magistrate's clerk, borough accountant, borough engineer, and their respective staffs. The Mayor will be provided with a parlour. On the second floor is to be the public hall, capable of affording seating accommodation for 1527 people. The Council will have a well-furnished Council Chamber with four adjoining smaller rooms, in which to transact committee work.

### A Dundee Competition.

WE have received from the Dundee Institute of Architecture, Science, and Art, a syllabus of their competitions for 1899-1900. The first competition is for a freehand sketch-book of architectural subjects, from existing buildings in pencil only, and not copied from any drawing; and the second is for measured drawings of any architectural subject, containing plan, elevation, and section. Competitors entering for the third on the list have to send in a sepia or chalk drawing from an antique subject in the Dundee Art Museum, and, of course, architectural historic ornament is preferred. Competitions four, five, six, seven, and eight are respectively a design for decorative treatment of the interior of a billiard-room; a design for a village hall to seat 400 persons, and to include caretaker's house, and suitable retiring rooms; a design for a golf club house for 150 members; a design for a fireplace in stone for a hall in a mansion; and an album containing not less than twelve large scale photographs of architectural details from existing buildings. Further particulars concerning these competitions can be obtained of either Mr. J. J. Henderson, or Mr. C. Soutar, whose address is 7, Ward Road, Dundee.

### Carthaginian Antiquities and Discoveries.

AN admirable museum of Carthaginian and Roman antiquities has been formed (says Sir Harry Johnston in his report to the Foreign Office on the progress in the Regency of Tunis) a collection which is being yearly added to by the excavations made under the direction of Père Dellatre on the site of Carthage. At Bir-Ftuha a great semi-circular basilica has been discovered and cleared of rubbish, and its decorative mosaics have been removed to the museum at Tunis. On the heights of the Odéon two Roman villas of relatively late date have been discovered and cleared. They contain mosaics in layers which represent in their series the gradual progress of the art, and therefore supply most interesting information as to the gradual development of mosaic work. Another Punic cemetery has been discovered near Borj-Jedid, while at Duar-esh-Shat, near Goletta, a most interesting mosaic, seven metres square, has been brought to light. It represents a Roman mansion with various hunting scenes, and a temple of Apollo and Diana. To the south-east of Zaghwan an interesting Christian Church has been discovered, containing a baptistry in the form of a cross, entirely paved with mosaics. One of the aisles had been closed at some time or other by means of an immense stone coffin-lid from a Pagan sarcophagus. This is ornamented with bas-reliefs of the Three Graces surrounded by the Four Seasons. This object has been removed to the Alaoui Museum, where also has been placed some very beautiful and perfect statues recently discovered by M. Gauckler near Carthage, and some large mosaics of the greatest interest, one of them illustrating the land of Egypt, with crocodiles, hippopotami, and apes.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### HALF-TIMBER WORK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Will one of your practical readers kindly give the best and cheapest method of constructing half-timber work (1) with a brick wall behind, and (2) without one; also a detail for the hanging and method of fixing. Do the London County Council require a brick wall behind half-timber work in a private house?—Faithfully yours,

STUDENT.

The accompanying photograph of a timber house in course of erection will probably explain the construction better than would much writing. The timbers were 6in. by 6in., mortised and pinned with hard wood pins, and though

work fixed in any external wall . . . shall be set back 4in. at the least from the external face of such wall." There are a few exceptions, but they do not affect the present question. G. A. T. M.

### CEMENT COVERING FOR BRICK WALLS.

To the Editor of THE BUILDERS' JOURNAL.

TONBRIDGE.

DEAR SIR,—Could you inform me with regard to cementing the bricks on the outside of a house to keep out the damp, what thickness of cement is best, and also whether it should be in one, two or three coats—the cement to be lined out to represent stonework. We have very little cement work in this district.—Yours faithfully,

J. M. S.

On some parts of the south coast, where the bricks produced are of too poor a quality for facing, cement stucco is very largely employed for exterior finishing. The brickwork is primarily rough rendered about 3in. thick with what is termed "compo" sand in conjunction with Portland cement, in the proportion of four or five to one, and after being lightly scored a thin finishing coat is applied,

acid in order to cleanse it and free it from impurities and foreign matter. The retailer usually keeps it under water, but before it can be dissolved it must be dried and should be broken up small and laid out to dry in a warm place for twenty-four hours or more, and when dry should be added to methylated spirit in the proportion of 4oz. to 6oz. to the pint. But difficulty is sometimes experienced in getting the lac to dissolve in the spirit—perhaps on account of the methylating material used in it—and if pure methylated spirit cannot be obtained (it is frequently difficult to procure, and some chemists will erroneously say there is no such thing to be had) absolute alcohol should be used as a solvent. It is a good plan to give the lac a preliminary soaking in ether; and when it is swollen the ether should be poured off as closely as possible, and that not taken up by the lac allowed to evaporate before the alcohol is poured on. Even then there may be a little of the shellac which refuses to dissolve. H. E.

## Professional Practice.

**Birmingham.**—Last Saturday, a new library was opened at the corner of Margaret Street and Cornwall Street, which has been built at a cost of about £10,000. Messrs. Cossins, Peacock and Bewlay were the architects, and Messrs. Barnsley and Sons, the builders. It is in English Renaissance style, carried out in Ruabon brick and white Hillington stone, with Westmoreland green slates for the roof. The building consists of two blocks on the Margaret Street side. The façade of two stories is divided into three sections—a gabled portion at each end—and between them a slightly recessed division, further subdivided by piers between the windows. The porch is of stone, and the large circular-headed windows have stone mullions and borders, the arches being broken by key blocks. The general reading room is 54ft. by 35ft., and the conversation room is 38ft. by 23ft. These two rooms are divided by sliding doors. The ceiling of the reading room is coved, with exposed timbers ornamentally carved. In addition to these rooms is a ladies' retiring room, lavatory accommodation, storage rooms, and general offices and rooms. The internal woodwork is of pitchpine, adamant plaster is used for the walls, and wood blocks are used for flooring.

**Bristol.**—A new chapel is being erected at St. Anne's Park in connection with the United Methodist Free Churches, and the memorial-stones were laid last week. It consists of a school-chapel, measuring 40ft. by 28ft., with seating accommodation for 250, and in the rear of this a vestry, with kitchen and lavatory accommodation. The style is Perpendicular Gothic, the walls being built of red pennant with freestone dressing and tiled roofs. The large room will have an open-boarded roof and pitch pine dado. The floor will be of pitch pine blocks, and the windows glazed with leaded lights. The cost will be about £900. The work is being carried out by Mr. E. C. Norris, of Bedminster, and the architects are Messrs. La Trobe and Weston, F.R.I.B.A.

**Dudley.**—A new Grammar School, which has cost £11,000, was opened at Dudley last Wednesday by the Countess of Dudley. Messrs. Woodhouse and Willoughby, of Manchester, were the architects, and Messrs. Webb and Round, of Dudley, the contractors. The buildings consist of a school completely equipped to accommodate 160 scholars, and a head-master's house. The style adopted for both blocks of the building is Tudor Gothic. Externally each structure is faced with red Ruabon bricks and terra-cotta dressings, and roofed with brindled Staffordshire tiles. Internally the joinery throughout has been executed in New Zealand Kauri wood, stained and varnished. The school building contains five large classrooms and a large central hall, the capacity of the latter being 56ft. by 28ft., and having seating

HALF-TIMBER HOUSE IN COURSE OF CONSTRUCTION.

the timber employed was elm, fir would do nearly as well. The interior was to be lathed and plastered, and the space between the timbers externally also to be plastered on lathing secured to small pieces of wood nailed to the studs, leaving the timber construction to show on face. Had brick backing been used, the timber framework would still have been first erected, and made perfect in itself, the brickwork being then built behind as well as to fill the interspaces. The tile-hanging on one of the sides was quite simply hung by the stubs cast on the backs of the tiles to strong-laths nailed to the framework. Brick walls would have to be plugged before lathing, if to be tile-hung, or else the tiles could be nailed direct to courses of "fixing blocks," and bedded in cement. This last would be almost the only construction allowed in London, where half-timber, except in dormers, is absolutely prohibited. Section 1 of the First Schedule to the London Building Act provides that "Every building . . . shall be enclosed with walls constructed of brick, stone, or other hard and incombustible substances," while section 55 of the Act itself provides that "All wood-

about 3in. thick, of washed sand and cement—usually about two to one—and the work is then lined to resemble stonework. The "compo" sand referred to is a mixture of coarse sand and shingle taken from the sea-shore, and the washed sand is the same material passed through water and with the shingle extracted. Work of this description should be finished off with a wooden float, and always looks better if the finishing coat is executed with coarse sand, a smooth trowelled surface being undesirable. H. E.

### DISSOLVING WHITE SHELLAC.

To the Editor of THE BUILDERS' JOURNAL.

SWANSEA.

SIR,—Will you kindly advise me the best way to dissolve white shellac. I want it to the thickness of cream. I have tried naptha and methylated spirits, with the result that it turned out like wet sawdust.—Yours truly,

WELCH.

Bleached shellac—also known as white shellac—is the ordinary lac boiled in a solution of soda, and washed in dilute sulphuric

accommodation for 250 adults. In addition there are a chemical lecture theatre, laboratory, &c., which are entirely separated from the school by means of a covered passage, and can be entered direct from the playground. The lecture theatre will seat thirty students, and the chemical laboratory sixteen. The basement also contains heating chamber, cooking kitchen, and mess-room, joining which is a partly-covered playground paved with patent limestone asphalt. The plans of Messrs. Woodhouse and Willoughby (Manchester) were accepted in an open competition, in connection with which fifty-four plans were sent in.

**Glasgow.**—The winners of the first three premiums in the competition for designs of ringburn Halls are Mr. W. B. Whitie, of 15, St. Vincent Street, Messrs. Thomson and Edmonds, of 241, West George Street, and Messrs. Watson and Silmond, of 231, St. Vincent Street. The assessors were Messrs. J. Burnet, A.R.S.A., T. L. Watson, F.R.I.B.A., J. A. B. McDonald, M.I.C.E. All the committee drawings are being exhibited in the Corporation galleries, Sanchiehall Street.

**Leicester.**—The Leicester Corporation recently offered premiums of £100, £50, and £25, for the three best designs for a new whole-

been given to the domestic offices, which will be complete in every detail. Barton-on-Sea is rapidly growing and increasing in popularity. The golf links adjoining the hotel, which have been laid out by Mr. Thomas Dunn, of Bournemouth, are now opened, and have been received most favourably, as is instanced by the attendance both of the general public and also of members of the club, which was started by Sir Robert Affleck, Bart., in connection with these links. Arrangements are also being made for gas supply and a good service of town's water. Our illustration is from a water-colour sketch, and represents the south front of the hotel. The architects are Messrs. Dancaaster and Co., of Bournemouth and London.

**Queenstown, Ireland.**—St. Colman's Cathedral is being extensively renovated, and Mr. G. C. Ashlin has prepared the necessary drawings and specifications for the completion of the interior. The tenders submitted by Messrs. Creedon, builders, of Fernoy, were accepted for the groined ceilings of the nave and transepts, the cleaning of the walls, and the carving of the strings, cornices, corbels, capitals, &c. Mr. J. A. O'Connell, of Cork, is attending to the sculptured subjects in the spandrels of the nave, also the erection and carving of the stonework of the shrines and

R. Stocks, sculptor, of Queenstown, is doing several of the groups in connection with the series of the Stations of the Cross, and the sculptures in the large music room of the organ gallery. The tender of Messrs. Harrison and Son, Dublin, was accepted for the sculptured work of the tympanum, and arches of the great west door, as well as that of the canopies adjoining. All the sculptured bosses on the intersections of the ribs and ridges of the groining of the nave were executed by Mr. Kelly, of Cork, and the gilding of the Stations of the Cross, and decoration of the altar and pedestal for shrine of Blessed Thaddeus, by Messrs. Purcell and Son, Queenstown. The whole of the painted glass windows of the clerestory, and those erected in the apse, and the arcade of the south transept were executed by Messrs. Hardman, Birmingham, while M. Mayer, Munich, was successful in obtaining others. The whole of the gas standards, candelabra for shrines, railings for opes in the triforiae, &c., were executed by Messrs. McCloughlin, Dublin, and the candelabra and altar furniture were executed by Messrs. Smith and Sons, Dublin.

**Sheffield.**—The foundation-stones of a new Wesleyan chapel, to be erected at the corner of Stafford Road, and Fitzwalter Road, were laid last Thursday. The new building will consist

ADDITIONS TO BARTON COURT HOTEL, NEW MILTON, HANTS. DANCASTER AND COMPANY, ARCHITECTS.

market, to be erected in that town. The design of Mr. Walter Brand, A.R.I.B.A., of Leicester, and Ipswich, has been selected for the first premium. His design estimated the value of the market at £24,087, cold storage at £17, baths extension £1,329; total £31,833. The Town Council, on the report of the Markets Committee, have appointed Mr. Brand as architect for the new market.

**New Milton (Hants).**—The additions to Barton Court Hotel, which are now nearing completion, will consist of a large new entrance and lounge, dining hall, extra suites of private rooms, kitchen, servants' hall and veranda, and upwards of thirty new bedrooms. The old wing is a picturesque, ivy-clad building of an old-world character, and was at one time a well-known gentleman's residence. Its position is unique, and standing in a bracing position on the sea front in its own large grounds, and directly facing the Isle of Wight from the Needles, with a view of Bournemouth and Swanage, no better position for a sea-hotel could be desired. In designing the new wing, the architects have necessarily kept the style of the old building in the exterior, but the interior will be replete with all the requirements of a high-class modern hotel. The dining hall will accommodate about 100 guests, and will have large mullioned and leaded windows. Special attention has

been given to the domestic offices, which will be complete in every detail. Barton-on-Sea is rapidly growing and increasing in popularity. The golf links adjoining the hotel, which have been laid out by Mr. Thomas Dunn, of Bournemouth, are now opened, and have been received most favourably, as is instanced by the attendance both of the general public and also of members of the club, which was started by Sir Robert Affleck, Bart., in connection with these links. Arrangements are also being made for gas supply and a good service of town's water. Our illustration is from a water-colour sketch, and represents the south front of the hotel. The architects are Messrs. Dancaaster and Co., of Bournemouth and London.

He has also erected the marble work in one bay of the apse. The groining of the aisles, which are of stone, is being executed by Messrs. Sharpe and Emry, of Dublin; also the cleaning and polishing of the massive marble columns that support the nave arcade. The tenders of Mr. Smyth, sculptor, of Dublin, were accepted for the marble work and sculptured group of the Annunciation in one of the bays of the apse, also for several of the series of the Stations of the Cross, which are sculptured in Caen stone. The tender of Mr. John Early, of Dublin, was accepted for the marble work and two sculptured groups—the Visitation and the Presentation of our Lord in the Temple—in two bays of the apse, and the decoration of three of the shrines—viz., those of the Holy Family, Sacred Heart, and the Agony in the Garden. The shrine of Our Lady of Good Counsel, which is executed in gold and coloured glass mosaic was obtained by the tender of M. Oppenheimer, and the grotto of Our Lady of Lourdes was awarded to the tender of Messrs. Fleming Brothers, Cork. The tender of Mr. J. C. Edwards, Ruabon, was accepted for the ceramic mosaic of the porches and passages, and that of the Wood-Block Paving Co., London, for the floors of the nave, aisles, and transepts. Messrs. Murray, of Youghal, are seating the interior, and Messrs. Sharp and Emry are supplying the pulpit. Mr.

of a church, with two vestries, a church parlour, and a schoolroom with several classrooms. The entire structure will be of stone, the general facing being pitch or rock-faced, with ashlar freely used for doorways, windows, &c. The church is cruciform in plan, measuring 97ft. interior extreme length, including chancel, 41ft. 6in. wide across the nave, and 59ft. 6in. in width across the transepts. It has an end gallery only. The church will seat 640 adults, or a mixed congregation of 850 persons. At the corner facing the junction of the roads is the tower, terminating with a spire 124ft. high. The front of the church has three doorways leading to the ground floor and gallery, and the centre doorway has over it a handsome four-light traceried window. The other windows throughout have painted heads, and the chancel has a circular traceried window. The schoolroom is built on the central hall plan, with classrooms around it, some of them opening into the hall. The length of the room inside is 50ft. by 29ft. wide. The classrooms are of varying sizes, there being two large ones for adult classes, and one large one for infants. The others are smaller. Accommodation is provided for 500 scholars. The cost of the work is £7,600, exclusive of land and the architect's fees, and with the cost of the site the total amount required when the scheme was commenced was about £10,000. The architect is Mr. John Wills,

F.S.Sc., of Derby and London, and the builder is Mr. John Fidler, of Eckington.

**Wandsworth.**—The new poor-law offices which are to be built at Wandsworth will be very imposing buildings, and the estimated cost is £20,311. Mr. Cecil A. Sharpe, A.R.I.B.A., of 59, Fenchurch Street, London, E.C., is the architect. The new buildings will be in Renaissance style, and the materials to be used are red bricks and stone dressings, with green slates on the roofs. Upon the ground floor will be a suite of clerks' offices and rooms for accountants, assistant relief officers for school cases, general settlement and inquiries, also lavatories and strong room, all approached by a wide corridor and a fine entrance hall and staircase. Facing East Hill, and connected with the offices by a waiting corridor, will be the Relief Committee rooms and waiting rooms for applicants. Each applicant will enter the committee rooms from the waiting rooms and depart by a different door. On the first floor will be the offices for the registrar and collector, spare offices and strong rooms. There will be a boardroom, and upon the east side a committee room and ladies' cloakroom. On the west side there will be a gentleman's cloakroom and ante-room. A separate staircase is provided to the public gallery and Press gallery, which also gives access to the caretakers' apartments. The building is to be constructed on fireproof principles, with steel joists and concrete floors, and internally the floors of the halls and corridors will be paved with mosaic, and the walls will have a cement face and glazed brick dadoes. Electric light is to be used throughout the building as well as gas, and there will be an electrical system of ventilation.

## Keystones.

**New Barracks at Winchester** were opened last Thursday by the Prince of Wales.

**Mr. J. J. Henderson** has removed to more commodious rooms at 7, Ward Road, Dundee.

**A Statue to Herr Helmholtz**, the eminent German scholar and mathematician, was unveiled last week at Berlin.

**The Theatre Royal at Peterborough** is to be rebuilt from plans by Mr. J. P. Briggs, of Arundel Street, Strand, London, W.C.

**A New Wesleyan Chapel** is to be erected in Agincourt Road, Hampstead, at a cost of £6,500, and the memorial stones were laid last week.

**The Restoration of Crowland Abbey** has been decided upon. The north wall of the tower is to be taken down and new foundations are to be laid.

**A New Bridge** has been erected over the River Feshie, Badinloch, which is about 130ft. in length, and consists of four spans. It has been built by Mr. Grant, of Badinloch.

**New Municipal Buildings** are being erected at Henley-on-Thames from plans by Mr. Henry T. Hare, F.R.I.B.A. Mr. W. F. D. Smith laid the foundation stone last Friday.

**Akroyd Park, Halifax**, is to be extended by the addition of the estate known as the Woodlands, comprising a little over two acres in extent. The cost of purchase is £2,500.

**A New Hospital is to be Built at Wath** at a cost of £5,960, and the tender of Mr. G. H. Smith, builder, of Mexborough, for this sum has been accepted by the Wath Joint Hospital Board.

**A New Church at Carnock** was opened last Wednesday. The church, which was erected from plans prepared by Mr. Scobie, of Dunfermline, is a Gothic structure, and has cost £1,200.

**OWSTON FERRY Church** has been reopened after repairs and alterations and the erection of a new organ. The latter cost £500, and the other improvements involved an outlay of £1800.

**Additions to the British Art Gallery** at Millbank have been made, which consist of ten rooms for new galleries, two of which are to be devoted to sculpture. The architect was Mr. Sidney Smith.

**Five Memorial Stones** were laid recently in connection with the erection of a new suite of class-rooms for the Yeaddon Wesleyan Sunday School. The estimated cost of the class rooms is about £800.

**The Proposed New Theatre at Llan-dudno** has been designed by Mr. G. A. Humphreys, in conjunction with Mr. E. O. Sachs. The total cost of the building is estimated at £14,000, and the site is to cost £3,000.

**The Oldest House at Largs** is to come down to make room for a modern tenement. The house in question is the one standing at the foot of the Kirkyard stairs in Maunse Close, and 200 years ago was the parish manse, and such it remained until the year 1784.

**A New Church for Oldbury.**—The foundation stone of a new church in the district of Churchbridge, Oldbury, was laid last week. The new structure is to be called Providence Church, and will accommodate about 400 persons. The total cost will be £1,300.

**A New Presbyterian Church at Tooting** was dedicated last week. The church has been built from American designs, and the building is supposed to have excellent acoustic properties. The new church has a spacious gallery, and the whole building seats over 700 persons.

**A Mission Hall for Hasland Wesleyans** is to be erected at a cost of £1,750, including site, from the plans of Mr. Cecil Jackson, of Chesterfield. The first floor will be devoted to school and class rooms, and the second will consist of an assembly room, with a seating capacity of 350.

**Almshouses at Pudsey.**—A group of five almshouses is being built in Robin Lane, at a cost of £50,000. The buildings are of stone, with dark Westmoreland slates for roofing, and each has a separate entrance, outbuildings, and rear space. Mr. C. S. Wilson, of Leeds and Pudsey, is the architect.

**A New Bridge at Clova**, over the River Southesk, was opened recently. It has been built according to plans by Mr. Donald Ross, road surveyor, at a cost of about £700, and has a span of 45ft. It is built of local whinstone, with cement foundations, the hewn work being Kerriemuir stone.

**A Wesleyan Methodist Chapel** has been erected at Rushton, Staffs., at a cost of about £1,250, which will seat just on 200 persons, and has a schoolroom to accommodate 150; both rooms can be used together. Mr. Clark of Smythamby, was the architect, and Mr. Sampson Salt, of Leek, the builder.

**The Victoria Hospital, Chelsea**, at the corner of Queen's Road and Tite Street, for the ministering to little children, has outgrown its original home, the old Gough House, and it is proposed to erect an entirely new building at a cost of £30,000, and utilise the present building as a residence for the staff.

**Additions to King Edward's Grammar School**, Stourbridge, have just been carried out by Mr. W. North, from plans by Mr. T. Grazebrook. The new buildings include a porch and window, a lecture-room, physical and chemical laboratories, and an additional classroom. The work has cost about £2,000.

**Death of a Stone Merchant.**—Mr. Thomas Turner, stone merchant, of Rock Terrace, Lightcliffe, died recently at Dr. Jessep's Hospital, Leeds, after an operation. He was head of the firm of Thomas Turner and Son, stone merchants and quarry owners, of Lightcliffe and Brighouse. He was aged 58 years.

**A New Organ for Norwich Cathedral.**—Mr. H. G. Barclay, of Colney Hall, Norwich, has offered to present to the cathedral a celeste organ in connection with the large new instrument, which is being built by Messrs. Norman and Beard. It is estimated that the additional instrument will cost about £1,300, and the entire organ £6,000.

**St. Dunstan's Alterations.**—Sir John Leng has intimated his intention to a representative of the "Pall Mall Gazette" to oppose any attempt at building on the eastern side of the church which will block out his "ancient lights."

**A Stained-Glass Memorial Window** was recently placed in Scraftoff Parish Church. The window is one of three lights, with tracery above, and the idea selected for representation is the "Communion of the Saints." The work has been carried out by Messrs. Ballantine and H. L. Gardiner, and was executed at their studios in George Street, Edinburgh.

**The Great Central Hotel** in Marylebone Road was opened last week by the Duchess of Fife. The hotel has an imposing frontage in Marylebone Road, and is of red brick with light terra-cotta dressings, and surmounted by a central lofty clock tower. There is a covered courtyard, similar to that of the Grand Hotel in Paris, but larger; this leads to a spacious lounge and main hall.

**Hexham Abbey.**—The joint report of Mr. C. C. Hodges, as architect, and Mr. Temple Moore, as consulting architect, on Hexham Abbey, has been accepted by the committee, and the work of restoration is to be carried out. The scheme is a large one, and comprises the building of the nave and putting back in their old places, as far as possible, all the old furniture of the choir and the detached chantries.

**The Congregational Church at Kingston-on-Thames** has been reopened after renovation. The ceiling and walls have been decorated, the whole of the woodwork has been stained and varnished, and choir stalls, which fifty seats, have been put on the right hand side of the pulpit. The church is now lighted by electricity. The work was carried out by Mr. Whitmarsh, under the supervision of Messrs. Carter and Ashworth, architects, and the cost was about £700.

**The Smoke Nuisance in Glasgow.**—Last Wednesday the first case since the supervision of smoke nuisances has been transferred to the Sanitary Department, was heard before the magistrate in the Central Police Court, Glasgow. The defendants were Messrs. Arrol Bridge and Roof Company, Limited, of Gilmiston Works, Petershill Road. The evidence of the two smoke inspectors of the Corporation showed that on May 11th the chimney connected with their boiler furnaces had emitted excessive smoke during fifteen minutes out of a forty minutes' observation. The magistrate found the respondents guilty on the evidence and imposed a penalty of 21s.

**A New Beachy Head Lighthouse.**—The lighthouse situate at Bellefonte, the second cliff westward of Beachy Head, will soon be thing of the past. The authorities have under consideration a scheme which advocates placing a new lighthouse on the foreshore beneath (viz., about one and a quarter mile eastward of the old one), where far less fog prevails than higher up, and whence its light will be visible from Dungeness on the eastward around through south to the western limit of the present light. This scheme involves the construction of a massive granite tower, the foundations of which will be laid at a level 9½ft. under low water, and temporary dars will have to be formed to admit of the settling of the lowest portions of the work. The tower which will be rather over 47ft. in diameter at its base, is to be solid for 47ft. 6in. upwards with the exception of the space required for the storage of water, and its height to the top of the masonry will be 123ft. 6in. Above the solid portion will come the rooms, eight in number (the four uppermost ones being 14 in diameter), and finally the lantern, in which will be installed a Dioptric (lenticular) illuminating apparatus of the most modern and approved type, giving two white flashes in quick succession every fifteen seconds. It is expected that the new lighthouse, which from the designs of Mr. T. Matthews, engineer-in-chief to the Trinity House, will be completed within three years from the date.

# Under Discussion.

## FORESHORE PROTECTION.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, June 5th, 1899, Mr. John C. Fell, President, in the chair, a paper was read by Mr. R. G. Allanson-Winn, entitled "Foresore Protection, with Special reference to the Case System of Groyning," introducing the subject, the author referred to the advantages of utilising the destructive forces of the sea for constructive purposes, and stated that his object was rather to give an account of what had actually been accomplished in that direction than to advance his own opinions or theories. Dealing with the question of changes constantly going on in the configuration of the country, he took as an example thirty miles of the Yorkshire coast, and calculated that, at a moderate computation, over 47,500,000 cubic feet of material were annually taken from the coast between Flamborough Head and Spurn Point. Where did it all go to? Much was doubtless deposited at the mouth of the Humber, greatly to the detriment of that estuary, and probably more was carried down southward by the flood tide and deposited, along with material eroded from the Lincolnshire coast, in the Wash, which was gradually silting up. The erosion, in the shape of falling cliffs, was noticed now and taken account of; what did not so readily meet the eye was the gradual deposit beneath the sea, and this accretion of silt would suddenly show itself some time next century when, possibly, 100,000 acres of land in the Wash would suddenly, by comparison, spring into existence and be added almost at once to the acreage of England. Taking one century with another we did not probably gain or lose much of our area. The addition of 100,000 acres in the Wash alone would make up for a good many years of cliff erosion. Having briefly quoted certain conflicting opinions on the moot point of the travel of each at various depths, the author endeavoured to show that, as Dungeness Point was steadily moving out into 100ft. of water, there was strong evidence that shingle, of which the point is entirely composed, is capable of motion in water at least 100ft. in depth. Allusion was then made to the unprecedented encroachment of the sea during the past year at Glenbeigh, on the southern shore of Dingle Bay, co. Kerry; an average of 20ft. being recorded for a distance of over 1,000ft. The problem here involved the protection of about 600 acres of land and some house property. The situation was one of exceeding gravity, and it had been decided to put in the groynes invented by Mr. Edward Case, of Dymchurch, because this system of low groyning had been so successful at other places where the natural difficulties were greater. Having alluded to the usually accepted methods of dealing with the question of foreshore protection, Mr. Winn pointed out that these oft-repeated and usually accepted methods had frequently met with but indifferent success, and that until Mr. Case brought out his system no one had ever promulgated a scientific theory as to the curve at which a shore should lie, and had also devised a simple and inexpensive form of groyning which should cause the sea itself to build up that shore to its required curved surface of repose. Mr. Case was able, by means of tables which he had constructed and the due consideration of certain details, such as range of tide, nature of shore, sections, &c., to build up any shore, save only an actually rock-bound coast, to an angle at which it could lie with the minimum chance of erosion or alteration of form. The paper was illustrated by diagrams showing, by means of sections, the actual gains at Dymchurch, Deal, Southwold, Lowestoft and Sheringham—which places were selected from a great many where the system had been successfully applied. The author contended that the invention was to be recommended by reason of its theoretical soundness, its practical utility and economy, and its success.

# New Companies.

## Everton Timber Company, Limited.

This company was registered on May 30th by C. Double and Co., of 14, Sergeant's Inn, London, E.C., without articles of association, with a capital of £2,000 in £1 shares. Its object is to carry on the business of timber merchants, brick and tile manufacturers, and property brokers.

## Road Maintenance and Stone Supply Co. Limited.

This company was registered with a capital of £50,000 in £1 shares, on May 27th, by Dollman and Co., of 9, and 10, King Street, London, E.C., to carry on the business of contractors for public works, granite, Kentish rag, flint, and gravel merchants, &c. The signatories (each one share) are Messrs. M. J. Greig, H. E. Beadle, C. H. Clarke, L. Cadic, H. W. Clarke, J. C. H. Greig, and W. B. Pritchard. The number of directors is to be not less than three, nor more than five. The subscribers are to appoint the first. Qualification £100.

## Ynysboth Paving Stone Company, Ltd.

This company was registered with a capital of £5,000 in £1 shares on May 31st by Jordan and Sons, Ltd., of 120, Chancery Lane, W.C. The objects of the company are to acquire a piece of land forming a part of the Ynysboth Uchaf Farm, in the Aberdare Vale, in the county of Glamorgan, together with the adjoining quarry situated on Ynysboth Isaf Farm, to enter into an agreement with D. Jenkins, J. George, and A. Richards, and to carry on the business of stone and cement merchants, &c. The first directors—to number not less than two nor more than ten—are G. H. Smith, D. Jenkins, J. George, A. Richards, O. W. Davies, and P. E. Hill. Qualification, £100. Remuneration as fixed by the company. Registered office: 3, Mill Street, Pontypridd, Glamorgan-shire.

## Black Hill Brick and Terra-Cotta Co. Limited.

This company was registered on May 31st, with a capital of £15,000 in £10 shares, by Jordan and Sons, Limited, of 120, Chancery Lane, London, W.C. The company has been formed to acquire certain lands at Black Hill, Entwistle, Lancashire, to adopt an agreement with R. Calderbank, Samson Fish, Swain Fish, and W. J. E. Salt, and to carry on the business of manufacturers of and dealers in red facing bricks, pipes, tiles, &c. The first directors—to number not less than three nor more than seven—are W. J. E. Salt, W. Bretherton, J. Ollerton, R. Platt, and N. Rushton. Qualification £250. Remuneration as fixed by the company. Registered office, 10, Carrington Road, Chorley, Lancashire.

# COMING EVENTS.

- Wednesday, June 14.**  
CARPENTERS' COMPANY.—Examination at their Hall. 6 to 10 p.m.
- Thursday, June 15.**  
SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Third conversazione.  
SOCIETY OF ANTIQUARIES.—8.30 p.m.  
INSTITUTE OF SANITARY ENGINEERS (Incorporated).—Half-yearly general meeting for the reception of balance-sheet, annual reports, &c. 8 p.m.  
CARPENTERS' COMPANY.—Examination at their Hall. 6 to 10 p.m.
- Friday, June 16.**  
CARPENTERS' COMPANY.—Practical Examination at the Company's Schools, Great Titchfield-street. 9.30 a.m. to 5.30 p.m.
- Saturday, June 17.**  
PEOPLE'S PALACE ARCHITECTURAL SOCIETY.—Visit to Drapers' Hall, E.C. 3 p.m.  
CARPENTERS' COMPANY.—Viva Voce Examination at the Hall. 12 noon.  
INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.—Northern District Meeting at Whitehaven.
- Wednesday, June 21.**  
SOCIETY OF ARTS.—Conversazione.

T. Blackburn ... 1,329 0 0 E. Wilson ... 1,137 14 5  
\*Accepted. [All of Bridlington Quay.]

**BRIDLINGTON QUAY.**—For the erection of two houses and three shops for Messrs. Lowson. Mr. J. Earnshaw, architect, Carlton House, Bridlington Quay:—  
J. H. Hudson ... £2,307 0 A. Gardam ... £1,743 15  
W. Moody ... 1,830 0 T. Blackburn ... 1,661 0  
F. Blackburn ... 1,757 0 J. Rennard ... 1,550 0  
E. Corner ... 1,750 0 \*Accepted  
[All of Bridlington Quay.]

**BROMLEY (Kent).**—Accepted for the erection of a house on the Sundridge Park Estate, for Mrs. Hindley. Messrs. Niven and Wigglesworth, architects, 34, Mecklenburg Square:—  
Lewis Evans, Bromley ... £1,600

**BROMLEY (Kent).**—Accepted for the erection of a house, Park Hill, Bickley, for Mr. Stenhouse. Messrs. Niven and Wigglesworth, architects, 34, Mecklenburg Square:—  
Lewis Evans, Bromley ... £1,595

**BURTON-ON-TRENT.**—Accepted for erection of artisan's dwellings (block No. 1), on the Horninglow Estate, for the Burton-on-Trent Artisans' Dwellings Company, Limited. Mr. Thomas Jenkins, architect, 35, High-street, Burton-on-Trent. Quantities by the architect:—  
Henry Edwards ... £3,962 10

**BURTON-ON-TRENT.**—For alterations to the Stapenhill Vicarage, for the Rev. F. W. Meynell. Mr. Thomas Jenkins, architect, 35, High-street, Burton-on-Trent. Quantities by the architect:—  
George Kennard, Accepted on schedule of prices.

**CARDIFF.**—Accepted for alterations and additions to Nos. 8 and 9, High Street, Cardiff, for Mr. Samuel Hall. Mr. S. Rooney, architects. Quantities by Mr. S. Rooney, jun.:—  
Thomas and Co., Cardiff ... £1,000

**CARDIFF.**—Accepted for rebuilding No. 15, High Street, Cardiff, for Mr. E. P. Reece. Mr. S. Rooney, architect. Quantities by Mr. S. Rooney, jun.:—  
C. H. Gibbon, Cardiff ... £1,200

**CHELMSFORD.**—For the erection of a pair of villas in King Edward-avenue, for Mr. W. C. Girdlestone. Mr. R. Mawhood, architect:—  
W. Fincham ... £1,190 J. Gowers ... £1,150  
\*Accepted.

**CLACTON-ON-SEA.**—For the erection of two houses, Marine Parade West, for Mr. F. Stauffer. Mr. T. H. Baker, architect and surveyor, Clacton-on-Sea:—  
Everitts and Son ... £2,875 H. J. Linzell ... £2,547  
Myll and Ellis ... 2,670 F. Dupont ... 2,477  
E. West ... 4,643 J. McKay ... 2,438  
[Architect's estimate, £2,100.]

**ILFORD.**—For the erection of two dwelling-houses, with shops, in the High-road, Ilford, Essex. Mr. Geo. M. Nye, architect, 47, Hova Villas, Hove:—  
Stroud ... £2,165 Willmott ... £1,855  
Primmore ... 1,860 Gowen (accepted) ... 1,639

**LEEDS.**—Accepted for the erection of Parochial Institute, Cavendish-road, Mr. H. Walker, architect, 8, Upper Fountains-street, Leeds:—  
Thos. Hannam, Raglan-road, Leeds ... £3,838 10

**LEYTON (Essex).**—For the construction of a chimney shaft, for the Urban District Council. Mr. W. Dawson, C.E., Town Hall, Leyton:—  
Cross and Co. ... £4,607 0 J. Jackson ... £3,147 0  
Myles and Warner ... 4,200 10 F. J. Coxhead, Ley-  
Gregar and Son ... 3,993 0 tonstone ... 2,935 0  
Neil and Co. ... 3,450 0 \*Accepted.

**LONDON.**—For new drainage works, and alterations to The Hall, Lincoln's Inn. Mr. Dennett H. Barry, surveyor to the Honourable Society of Lincoln's Inn, 21, Old-square, W.C.:—  
B. C. Hubble ... £2,675 Alfred Bush ... £1,677  
G. A. Watts ... 1,975 \*Accepted.

**LONDON.**—For alterations and rebuilding, Kensington Dispensary, Church-street, W., for the Trustees. Mr. G. Gordon Stanham, architect, 100a, Queen Victoria-street, E.C. Quantities by Mr. Gilbert Booth, 3, Adelaide-street, W.C.:—  
Duffield and Son ... £3,340 Barker and Co. ... £2,992  
Perry and Co. ... 2,925  
Walter Nash ... 3,150 Kearley ... 2,870  
John Appleby ... 2,995 Speechley and Smith ... 2,845

**LONDON.**—For the erection of new business premises in High-street and Wimpole-street, Clapham, for Mr. J. G. Waite. Mr. Fred E. Halford, architect, Ingram House, 165, Fenchurch-street, E.C. Quantities by Mr. A. J. Thompson, 50, Lincoln's Inn-fields, W.C.:—  
W. Downs ... £4,428 George Parker ... £4,140  
Kilby and Gayford ... 4,355 Garret and Son ... 4,056  
Woodward and Co. ... 4,299 Edwards and Medway ... 4,050  
J. E. Oliver ... 4,281 Nichols Bros. ... 4,028  
\*Accepted.

**LONDON.**—For erection of chimney shaft and alterations and additions to boiler-house at the South-Eastern Hospital, for the Metropolitan Asylums Board:—  
Kirk and Randall, Wool-  
wich, S.E. ... £5,590 0 0

## CONTRACTS OPEN.

### BASINGSTOKE URBAN DISTRICT COUNCIL.

**TO BUILDERS AND CONTRACTORS.**  
The Council invite TENDERS for the ERECTION of a JOINT ISOLATION HOSPITAL. The plans and specifications can be seen, and bills of quantities obtained, at the Office of Mr. JAMES GIBSON, No. 3, New-street, Basingstoke, on payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

Security will be required for the due performance of the contract.

The Council will not be bound to accept the lowest or any Tender.

Sealed Tenders, endorsed "Isolation Hospital," to be delivered at my Office, Town Hall, Basingstoke, by TWELVE o'clock, noon, on WEDNESDAY, JUNE 21st, 1899.

Town Hall, Basingstoke,  
June 1st, 1899.

F. S. CHANDLER,  
Town Clerk.

### COUNTY BOROUGH of BRIGHTON.

**TO CONTRACTORS AND OTHERS.**  
Notice is hereby given that the Council of the said County Borough will receive TENDERS from such persons as may be willing to enter into a Contract for the CONSTRUCTION of an UNDERGROUND CONVENIENCE, together with sundry Works connected therewith, around the base of the Clock Tower, Queen's-road, Brighton.

The specifications and form of Tender may be obtained on application at the Office of the Borough Engineer and Surveyor, Mr. FRANCIS J. C. MAY, Memb.Inst.-C.E., at the Town Hall, Brighton.

Sealed Tenders, addressed to me, and endorsed "Tender for Construction of Underground Convenience," must be left at my Office, at the Town Hall before TEN o'clock in the forenoon on FRIDAY, JUNE 30th, 1899.

Power is reserved to reject the lowest or any Tender.  
FRANCIS J. TILLSTONE,  
Town Clerk.  
Town Hall, Brighton,  
June 3rd, 1899.

### BOROUGH of TUNBRIDGE WELLS.

**WORKMEN'S DWELLINGS.**  
The Corporation are prepared to receive TENDERS for the ERECTION of FIFTY-THREE FOUR-ROOMED COTTAGES and FIVE BLOCKS of TEN MEN'S.

Plans and specification may be seen at the Borough Surveyor's Office, and quantities and forms of Tender obtained from me on payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

Tenders to be sent to me on or before JUNE 19th, 1899.

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,  
W. C. CRIPPS,  
Town Clerk.  
Town Hall,  
Tunbridge Wells.

## COMPETITIONS.

### TO ARCHITECTS.

The Wharfedale Union Joint Isolation Hospital Committee invite DESIGNS for the erection of an ISOLATION HOSPITAL.

Premiums of £30 and £15 will be awarded for the two best designs, the premium of the selected designs to be merged in the commission.

Plan of site and requirements may be obtained from the undersigned.

The Designs to be delivered by SEPTEMBER 1st next.  
C. V. NEWSTEAD,  
Clerk.

Union Office,  
Boroughgate, Otley.

## BUILDING PRACTICE IN PARIS.

## THE MAKING, WIDENING, AND STRAIGHTENING OF THE STREETS.

By EDWARD CONNER.

IT was only in 1811 that any important works for the architectural amelioration and ornamentation of the city of Paris were undertaken. Till the seventeenth century the inhabitants were free to construct houses independent of any line of order, but a decree published in the year 1783 directed that henceforth no street could be made having a width less than 30ft., and that in the case of streets of a smaller width, where houses were to be rebuilt, space should be secured to obtain the decreed breadth. Later the fundamental principle of the façade line for structures was fixed, and adopted by the whole country. That line is arranged as the boundary for the highways and local roads, as well as for streets in cities, boroughs, and hamlets. Those intending to build houses must rigorously observe that line of demarcation, under pain of having their edifices demolished, as well as being fined into the bargain for violating the law. Nor can any new street be opened unless complying with the line of regularity. An individual having selected a site in Paris on which to erect a house, forwards his application, with the plans of the projected buildings, to the Secretary of the Prefecture of the Seine, familiarly and better known by the name of "l'Administration"—but which is practically the Municipal Council—by whom it is referred to the Architectural Department. The latter consists of twenty salaried architects, one for each of the *arrondissements* or wards of the city; twenty assistant architects, twenty-one inspectors, fourteen sub-inspectors, seven superintendents, and eleven examiners of executed work and estimates. This body considers all demands for the erection of buildings, the opening, widening, and rectification of the irregularity of streets, and the sewage, gas, and water arrangements. Independent of this staff, the Prefecture of Police has its own ten architects to watch over the salubrity of buildings, the waste grounds of the city, and the structures that might entail accidents. Then the Government also has its Department of Public Works, which looks after public edifices, both civil and religious, the monuments, &c.

If the applicant after the lapse of twenty days receives no objection against his demand to build, he can at once commence operations. The architect and builder now come upon the scene, and they are bound by iron regulations. Let it be remembered that no jerry house can be erected in Paris; each structure is composed of iron and stone, destined to last two or three centuries, and representing a studied investment to yield five, but of late not more than three, per cent., on the capital sunk. Before the contractor can commence operations he must forward to the Administration the working plan of the foundations, along with a sketch of the geological character of the site. The architect's duty consists, not only in designing the plans of the building, but in watching over their execution, and seeing that sound materials only are employed, the builder undertakes the works at his own risk, while the official inspectors control all. Both the architect and builder are jointly responsible for their edifice during ten years, should it prove defective either from faultiness in construction or in plan. Paris, that is to say, the Municipal Council which represents the Prefecture of the Seine, has a special right to expropriate, in the interest of public utility, the facilitating of traffic, &c. As a general rule, the municipality's power to expropriate is limited to the houses coming between the two fixed lines, or boundaries of the street. It is the Municipal Council that decides what new streets shall be made, widened, or straightened. The aim is not only to embellish the city, and relieve the congested traffic of the main arteries of circulation, but also to admit air and sunlight into the old quarters, the slums of the capital. When the Second Empire collapsed,

several of the city improvements commenced by Baron Haussmann were unachieved. A few remain in that condition still, such as the Boulevard Haussmann itself, which is awaiting its destined opening up to the Bourse or Exchange.

Another vast scheme has just been completed, namely, the termination of the Rue Réaumur, from the Bourse to the Jardin du Temple, close to the Bastille. This forms a straight, uninterrupted wide street from the Place de l'Opéra, more than two miles in length, that cuts through the business and industrial centres of the city. The completing of the Avenue d'Antin to the Rue du Faubourg St. Honoré, had to be reduced in width, on account of the great expense the execution of the original plan would entail. The municipality could only accomplish what its resources permitted; but it executed secondary improvements in widening thoroughfares through districts densely inhabited by the working classes, demolishing houses that projected beyond the new street lines, and, above all, completing the sewage system. The Council having fully examined and publicly discussed the necessity for opening a new street on the grounds of public utility, the technical commissions make surveys of proposed routes, and draw up the necessary plans accordingly, including the estimates of course. The owners and occupiers of houses situated within the lines or boundaries of the street receive a notice to forward, accompanied by all legal proofs, their claims for indemnity for being thus expropriated. These lie in the public office of the Mayoralty during eight days, when all interested in the claims and mortgages, or who are opposed to the improvements, can record their objections, or make suggestions. An intended *approprié* can appeal, but if defeated, he must pay all the expenses of the suit. All that the municipality does in addition is to demolish the condemned structures; to offer the site on each side of the street lines free of *débris* to those who desire to purchase; to construct the main sewer—a carriage drive, beneath the roadway, with lateral branchings for future cess pool matters—and afford the water, gas, and electric companies facilities to lay down their mains and cables beneath the footpath.

Though the Municipal Council only expropriates structures coming within the boundaries of the new street, it can purchase on right or left any establishment of an insalubrious character laid bare by the improvement. Those who are to be expropriated having sent in their claims for an indemnity, the council replies by its offer. If the matter is—not amicably settled the parties appear before a special and sworn jury composed of twelve business men, promiscuously selected, with four supplemental jurors, but the latter cannot vote. The case on both sides is patiently examined—it is really a court of arbitration. The jury decides by a majority vote the amount to be awarded, and from this decision there is no appeal; it must not be more than the claimant demanded nor less than the municipality offered. The jury is to give no reasons for its verdict. If the indemnity be less than the sum offered by the municipality the appellant pays the cost; if equal the municipality does so; if superior both parties meet the one-half. As a general rule the jury leans to augmenting a fair claim for compensation. The decisions are duly published in the "Journal Officiel," and those having the right to the indemnity are paid. In case of contestation, the amount is simply transferred to the *Caisse des Dépôts et Consignations*, where it remains until such time as the law decides.

The property having been cleared, and the sewers, &c., constructed, proprietors, architects, and builders can commence their respective operations. The proprietors must pay for the initial paving of the street, and flagging of the foot-paths. Minute rules are fixed for the height of the house, in proportion to the width of the street, for the chimneys, sewage, water-closets, projection of cornices, balconies, &c. A street 26ft. wide can have a house from ground floor to attic, 40ft. high; if 67ft. wide, the house may be 67ft. in height. The administration can make concessions in the case

of an artistic structure, an institution, or a factory. In the case where only a part of a building, or a portion of land would be required for any street improvements, the municipality will purchase the lopped-off portions if required, and dispose of them to neighbouring occupiers. After the making of a new street has been decided upon, the occupiers, who repair or improve premises destined to be demolished, in order to increase their demand for indemnity, will see the "extra" summarily rejected.

There are societies that purchase from the municipality the sites on each side of the new street, and resell to private persons as dearly as they possibly can. Insurance companies invest their funds largely in both speculations. But the site must not be kept unoccupied beyond an agreed upon period, under forfeiture of the right, the infliction of a fine, and the public sale of the lots. There can be no difficulty in obtaining money to build; the combinations of the *Crédit Foncier* will secure that, by means of loans at a fraction under five per cent. per annum, repayable over a period of seventy-five years; but the *dut Foncier* must have or be given the first mortgage on the building.

Where does the Municipal Council obtain the money to carry out the street improvements of Paris? Principally by loans, by the sale of the building sites, the increased revenue from the higher assessment of property, the augmentation in the population, and the numerous attractions which the city of Paris affords to both provincial and foreign visitors. In 1890 Paris had 84,083 rateable constructions, of which 81,291 were dwelling houses, the rest were factories and workshops. The population of the city is two and a-half millions; its revenue in 1896 was 337 million francs, of which 153 millions represented the outcome of the *octroi* or entry dues; while thirty-three millions are raised by quasi-direct taxation of four to five centimes (one-halfpenny) on rateable property; a one-half centime, that is, the twentieth part of a penny, struck on the latter will realise 334,000 francs. The city's expenditure is equal to its receipts, and of the former 111 million francs are annually allocated to pay the interest on loans and their extinction by lottery redeemed bonds. The total debt of Paris at present is nearly two and a-half milliards of francs, raised by ten loans between 1855 and 1894. From 1858 to 1867, that is to say, during the Second Empire, and under the sway of the great city embellisher, Baron Haussmann, 816½ million francs were borrowed. The Municipal script of Paris ranks as the first of *valeurs* in France; it is always above par, and yields 3 to 4 per cent.

**Dispute About a Verbal Agreement.**—At the Keighley County Court last Wednesday Messrs. Abraham Sunderland and Sons, stone merchants and quarry owners, of Hainworth, near Keighley, sued Mr. William Briggs, contractor, of Bradford, to recover £22 6s. 2d., balance of account for stone supplied. The question was as to the precise nature of the verbal agreement between the two parties. It appeared that the defendant gave Mr. John Sunderland, one of the plaintiffs, an order for a consignment of 8in. setts at Bradford, in April, 1898, to be used in the repair of Clyde Street, Bingley, for the Urban District Council. The material was supplied at the plaintiffs' direction by Messrs. Alexander Dyson and Co., of Haworth, but on its reaching Bingley the clerk of works refused to allow the first three trucks to be laid. Mr. Armistead, who was then surveyor, was seen, and he condemned the stones, and also rejected four trucks as too soft. The material had since been lying at Bingley Station. Mr. Sunderland said that the only condition specified was that the setts should be similar to those used in Charles Street, Bingley, and this he had carried out. The defendant declared that he told the plaintiff most emphatically that the pavings would have to be passed by Mr. Armistead. His honour elected to accept the defendant's version of the contract, and gave judgment accordingly, with costs.

## Masters and Men.

**Earlstown Bricklayers** have struck for an advance of  $\frac{1}{2}$ d. per hour, which would make their wages 9d.

**Wellingborough Bricklayers** have struck work in consequence of the refusal of the masters to limit boy-labour.

**The Strike at Messrs. Doulton and Co.'s Clay Pits**, which occurred some seven weeks ago because twelve men were dismissed for declining to take the places of twelve others who had refused to work until nine o'clock, has terminated.

**Edinburgh and Leith Plumbers** still continue to hold out, and seem to be slowly but surely compelling the masters to accede to their demands. Some sixty-seven masters have now fallen in with their requests.

**The Joiners at Wakefield**, who have been on strike since May 1st, have decided to resume work at the advance offered from  $7\frac{1}{2}$ d. to 8d. per hour, and on the old rules, leaving the question of new rules until after the coming conference in connection with the building trades dispute.

**The Newcastle and District Builders' Association** refused an advance of wages from 9 $\frac{1}{2}$ d. to 10d. per hour to the joiners in Newcastle-on-Tyne, North and South Shields, and Blythe. The men went out on strike last Saturday, and refused the masters' offer to defer the dispute to arbitration.

**Settlement of Arbroath Masons' Strike.**—At a conference held last week between the masters and representatives of the men in reference to the strike of the operative masons for an advance of wages from 8d. to 8 $\frac{1}{2}$ d. per hour, the masters intimated that they were prepared to give the increase, and the offer has been accepted on behalf of the men.

**Leicester Bricklayers' Labourers' Strike.**—The Master Builders' Association of Leicester having invited the labourers to return to work under the old conditions, the men held a meeting to consider the situation. It was unanimously determined to adhere to the demand for an increase of wages to 6 $\frac{1}{2}$ d. per hour, a similar resolution being come to at a meeting of the local branch of the General Labourers' Union.

**The Edinburgh and Leith Joiners' Strike** still drags along. The Scotch are usually very business-like and prompt in all matters, but this affair seems to be an exception. At a meeting of the employers last week it was ascertained that over 800 men were at work with associated employers under the old conditions. A letter was read from Mr. J. W. Robertson, of Her Majesty's Board of Works, suggesting a meeting between employers and workmen. The meeting agreed to this taking place, the arrangements for the conference being left with Mr. Robertson. At a meeting of the workmen it was reported that three additional masters who would employ about fifty-five workmen altogether had accepted the terms. Up till now the number of masters who have conceded the demands is twenty-two.

**The Dumfries Masons' Strike** still continues, although there is now some likelihood that it will be shortly brought to a close. Some little time ago Provost Glover offered to undertake the office of arbiter alone or conjointly with Sir Mark McTaggart Stewart, B. P., or Mr. Thomas McKie, advocate. At a meeting of the men on Monday night last week it was resolved to thank the Provost for his intervention, and to inform him that, while they declined arbitration, they were quite ready to meet with the employers in conference presided over by him. On Tuesday night last week the employers came to a similar resolution, and as both parties are

apparently anxious for a settlement it is believed that one will be effected in the manner suggested.

**The Danish Lock-out.**—At the meeting of the London Trades Council last Thursday evening the Secretary read the following telegram from the Chairman of the Trades Federation of Denmark: "The Association of Danish Employers has excluded 30,000 workers in the building and iron industries in Denmark. Another 10,000 are also excluded. We number 80,000 organised men. Denmark has but two millions and a quarter of inhabitants, therefore it is impossible to support ourselves with help from this country. The capitalists have claimed so much that the existence of our organisations will be impossible if we lose. Help us with money as speedily as you can." It was agreed to ask London Trade Unions to support the Danish Federation financially.

**The German Strikes Bill.**—In the course of the debate on the Supplementary Estimates in the Reichstag last week Herr Bebel made a speech on the Strikes Bill. He said it constituted the most violent attack which had ever been made on the freedom and human dignity of the working classes, and that it came at a moment when, on the other side of the Vosges, the wrong done to a single man was being made good, and when, on the other side of the Alps, the monarchy was trying to undo by an amnesty the wrong which had been done in the preceding year. Then, upon the speaker describing the Bill as a shameful measure, he was called to order. Count Posadowsky, Secretary of State for the Interior, said, in reply, that Herr Bebel would receive an adequate answer when the Bill was being discussed. The Bill was intended to cope with excrescences upon the right of combination.

**The Dispute in the Building Trades.**—The conference between the masters and men in the building trades, which was to have been held in London last Thursday, has been indefinitely postponed. It was anticipated that the conference would be held on the same lines as the one between the building trades' employers and the representatives of the plasterers. The meeting of the Council of the National Federation of Building Employers at Derby on Monday last week was held to confirm the settlement with the plasterers, to appoint three members to meet an equal number of delegates from the Building Trades Operative Unions, and to arrange the basis of procedure at the general conference which was to have taken place last Thursday. A report setting forth the proceedings at the conference with the plasterers was presented, and the settlement then effected was confirmed. At the conference which took place at Derby on the same day, the men's delegates declined to accept the proposal to conclude the dispute on the lines of the settlement with the plasterers, stating that the suggestion made at the conference of trade union delegates at Manchester only empowered them to confer with a view to the establishment of a National Conciliation Board, to which disputes could be referred. When it was found that the men's delegates were only empowered to discuss the establishment of a national conciliation board, the employers passed a resolution giving them fourteen days in which to put their proposals into writing. If the conference had resulted satisfactorily for the employers, the Yorkshire masters would have withdrawn their lock-out. The Leeds branch of the National Association of Operative Plasterers have unanimously ratified the terms of the settlement agreed upon at the London conference. The vote of the members of the National Association of Operative Plasterers on the settlement arrived at at the conference in London was declared last Saturday, and shows that 4,559 were in favour of accepting the terms and only 368 against. This vote is very satisfactory and remarkable among Union votes for its unanimity upon the terms of settlement. The Executive Committee of the Plasterers' Association, who negotiated the settlement, have been re-elected by great majorities.

## Builders' Notes.

**Cardiff Masons** have accepted an advance of  $\frac{1}{2}$ d. per hour on their wages.

**Jarrahdale Jarrah.**—The "Oberon," with 670 loads of Jarrahdale Jarrah on board, has arrived in London to the order of the agent for Jarrahdale Jarrah Forests and Railways, Limited, 1, Fenchurch Avenue, E.C.

**A Rise in Copper.**—Messrs. Ewart and Son, of 346 to 350, Euston Road, London, N.W., inform us that owing to the increasing price of copper they are compelled to advance all net prices of copper goods  $2\frac{1}{2}$  per cent. This advance, with that of Jan. 26th, makes an extra  $7\frac{1}{2}$  per cent. added to the net price of all copper goods.

**The Mechanical Bricklayer**, to which we referred last week, is the invention of Mr. Alfred William Turner and his son, of Birmingham, who have secured British and international protection for their invention, which is called "Turner's Lineobrick and Octipus Brick-setting Machine." The inventors claim for their appliance the virtue of doing the work now undertaken by bricklayers. Briefly, it will automatically set a row of bricks, slabs, stones, &c. Messrs. Turner have offered to assign the rights of the "mechanical bricklayer" for fourteen years to a workmen's trust, composed of leading trade unionists and non-unionists, the consideration being that each bricklayer earning the average wages of his district shall pay a royalty of 2s. a year to the inventors.

**Disputed Building Line.**—In the case of Regina v. Felixstowe Urban District Council, on the application of Mr. John Crowle, the High Court has granted a rule nisi against the Felixstowe District Council to show cause why they should not pass plans of two houses which the plaintiff proposed to erect in Hamilton Terrace, and of which they had disapproved. On June 6th, before a Divisional Court, consisting of Mr. Justice Day and Mr. Justice Lawrence, the District Council appeared to show cause against the said rule.—Mr. Tindal Atkinson, for the defendants, said the facts of the case were that Mr. Crowle was proposing to build two houses in Hamilton Terrace, Felixstowe. It was a matter of some moment to the District Council to keep the buildings in a uniform line, so as not to have them in an irregular way. The plans lodged by Mr. Crowle, he contended, showed that the buildings would be in front of other buildings in Hamilton Terrace. The plans showed that Mr. Crowle intended to erect a house 25ft. from Hamilton Terrace, whilst the next houses were 78ft. 9in. away from the same street. Mr. Crowle contended that he could build in line with a house known as "Cragside." That building, however, was erected before 1888, when the Public Health Act (Buildings and Streets) was passed. The question was whether "South Cliff" and Beacon Villas were in Brownlow Road or in Hamilton Terrace. These roads were parallel to each other, and the land on which it was proposed to build the houses was between the two roads. Mr. Glen, for the plaintiff, in support of the rule, argued that the case of the Attorney-General v. Edwards, before Mr. Justice Romer, decided the point, and that where houses were set back from the street a distance, they were really not in the street, and that according to the case mentioned, it mattered not as to how letters were addressed for the purpose of finding what street a house might be in. After hearing other decisions quoted in support, Mr. Justice Day said he had come to the conclusion that the decision of the Attorney-General v. Edwards applied, and that the rule must be made absolute, and that the mandamus must issue against the local authority to approve the plans deposited by Mr. Crowle, the building line for Hamilton Terrace being in line with the houses known as Seagull and Cragside.

## Engineering Notes.

**The Eye and Ear Infirmary, Portsmouth,** is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**The New Pier for Rock Ferry** is almost completed, the new landing stage which has been built by Messrs. Jenkins Bros., of Birkenhead, for the Birkenhead Corporation, being delivered on the 8th inst.

**Electricity at Bolton.**—The Bolton Town Council have decided to apply for borrowing powers for £100,000 in connection with electric trams and lighting. The tramway project includes about eight routes of thirty miles.

**The Omagh Asylum,** now in course of erection, is being ventilated by means of "Cousland's Improved Climax" Patent Direct-acting Invisible Roof Ventilators, supplied by the "Climax" Ventilating and Heating Co., Ltd., 93, Hope Street, Glasgow.

**Electric Lighting at Grimsby.**—Consent has been given by the Local Government Board to the application of the Grimsby Town Council to borrow £43,500 to carry out their electric lighting scheme. The Public Lighting Committee of the Corporation have recommended the acceptance of the tender of Messrs. Hewins and Goodhand, of Grimsby, for the erection of the buildings and chimney shaft at a cost of £11,525 2s.

**South Shields Railway Station** is being considerably improved by the North-Eastern Railway Company. The principal feature of the improvement is the laying of a third line of railway through the station, in order to allow of trains being brought alongside of both platforms, and still leaving a line clear for the passage of the engines to reverse. As this will necessitate the widening of the station, the old forge and livery stables, which occupied the site of the old Stanhope and Tyne engine shops, immediately to the westward, have been cleared away, and the west platform, the station wall, and the building in which are located the waiting rooms, offices, etc., will be set further back. A foot-bridge will be then constructed across the railway from platform to platform, near the site of the present temporary structure.

**Institution of Civil Engineers.**—The second annual engineering conference was held in London on June 7th, 8th, and 9th, under the auspices of the Institution of Civil Engineers. The meetings were partly held in the Institution buildings in Great George Street, and partly in the buildings of the Mechanical Engineers and the Surveyors' Institution. They were held in various sections, the subjects being classified as follows:—Railways; harbours, docks, and canals; machinery; mining and metallurgy; ship-building; waterworks, sewage and gasworks; and applications of electricity. Altogether, some thirty-five papers dealing with different phases of these subjects were read. At the opening of the conference last Wednesday the President, Sir William Henry Preece, F.R.S., delivered a short address. He said that conferences like the present facilitated intercommunication among the members, and by bringing them into more personal and social relations with each other harmony was promoted, jealousy allayed, and progress secured. Conferences disseminated knowledge by exciting discussion and extracting opinions from those who had acquired them from the only true master—experience—in every quarter of the world. In the concluding part of his address the president said the Lord Chief Justice's Bill for the suppression of illicit commissions was welcomed by every member of the institution, and it was most gratifying to find that no suspicion of improper practice had ever been adduced against their profes-

sion. They did, however, hear at times of a dangerous border-ground between consultation work and contracting, which was a pitfall to be avoided and to be surrounded by danger signals.

**Alleged Breach of Contract.**—An action was brought against the Mayor, aldermen, and burgesses of Keighley, last Wednesday, at the Keighley County Court, by T. Jackson, machine broker, to recover £50 for breach of contract. Mr. Beverley, for the plaintiff, stated that the action had arisen out of what he contended was the sale of some old materials at the old mill, Corn Mill Bridge, which property had been acquired by the Corporation for street improvements. The plaintiff tendered for the engine, pipes, shafting, etc., and his offer of £75 was at first accepted by the Highways Committee. The borough engineer wrote enclosing an account, and requesting the plaintiff to pay the money to the treasurer. A dispute afterwards arose as to whether a cistern was included in the purchase, and in the end the committee, after deciding to recommend the council to approve the contract, recommended that it should be rescinded. This the council at their meeting agreed to. Mr. Beverley contended that there had been a binding contract between the plaintiff and the borough engineer, as agent for and on behalf of the Highways Committee, and that the committee had sanctioned what their engineer had done. The case collapsed, his Honour holding that there was no evidence of any contract on the part of the committee or the council, or of any authority vested in the borough engineer to enter into such a contract. In his opinion the engineer did not hold himself out as having power to make such a contract. Judgment for the defendants, with costs, was given.

**British Iron Trade Association.**—The annual conference of the members of this association was held last Wednesday at the Westminster Palace Hotel. Sir John Jenkins, who was elected president for the ensuing year, said that during the past year the subject of American competition had occupied a great deal of attention, because the pig iron, rails, billets, wire rails, and other products of the mills and forges of the United Kingdom appeared to have become regular items in our periodical import return. But although this was a deplorable fact, he still thought English firms could successfully compete with American. Mr. W. Jacks read a very useful paper on some recent aspects of industrial conciliation, in which he enumerated cases in which strikes had been prevented by the exertions of local boards of conciliation. Referring to Mr. Ritchie's proposals for preventing and settling disputes between capital and labour, he said that one of the main difficulties of the employers in considering any scheme of mutual action with their workmen designed to get rid of trade conflicts was the fact that they thought they would be thereby called upon to recognise as fully representing the cause and interest of labour delegates or unions that represented only a fractional part of that interest. Another difficulty was that there could be no adequate provision made in such a scheme for representing the unorganised industries, which were, numerically, by far the most important. Another serious objection to the establishment of any general industrial council on the lines suggested by Mr. Ritchie was the fact that if it was to be of any use it must have plenary and final authority in dealing with matters in dispute, and that this condition involved possibilities of the most serious issues being settled by men who could not have an intimate or sufficient knowledge of the questions in dispute. He suggested compulsory arbitration for preventing disastrous trade conflicts. As to the constitution of the tribunal, he inclined to the appointment of not more than three well-known men—business men by preference—in whose judgment and integrity the general community had confidence. Sir A. Hickman doubted whether it was possible to carry out compulsory arbitration. The annual dinner was held in the evening of the same day.

## Surveying and Sanitary Notes.

**Morecambe Improvements.**—The Morecambe Tower Company, Limited, have just let the last of their principal contracts for the erection of a new tower at the East End. The structural iron-work is to be done by Messrs. Somervail and Co., of Bridge and Roof Works, Dalmauir, N.B.

**Electric Railway from Fleetwood to Morecambe.**—The Lancaster Rural District Council have assented to a scheme for constructing an electric railway from Fleetwood to Morecambe. They have also approved of a proposed light railway from Knott End to Lancaster.

**The Devonport Surveyors' Committee** have resolved that the carriageways in private streets in the borough are not in future to be taken over by the local authority as public highways, repairable by the inhabitants, until such carriageways have been paved with wood or stone to the satisfaction of the borough surveyor. This resolution does not apply to streets which had been made up with a finished macadam surface to the satisfaction of the borough surveyor on or before March 31st.

**Oswestry Sewage Disposal.**—Mr. W. A. Ducat, Local Government Board Inspector, recently held an inquiry into the application of the Oswestry Town Council to borrow the sum of £3,500 for the completion of the sewage disposal scheme. The Town Clerk, in opening the case for the Corporation, said the Council asked that the repayment of the proposed loan of £3,500 should be extended over thirty years. The money was required for the purchase of land adjoining the sewage works now in existence, and to enable the works to be completed. The sum of £3,500 was made up as follows:—Works, £1,900; land, £900; and contingencies, £700.

**Bradford Street Paving.**—An inquiry was held at the Bradford Town Hall last week by Mr. H. P. Boulnois into the application of the Corporation to the Local Government Board for permission to borrow £100,000 for the purposes of street paving in the city. There was no opposition, and it was stated that it was proposed to pave Market Street, Lower Ivegate, Booth Street, Hall Ings, Charles Street, Tyrrel Street, Swaine Street, part of Lumb Lane, and Upper Godwin Street with wood. In all there would be 28,482 square yards of wood paving, and the estimated cost was £27,769. There would also be 94,136yds. of granite paving, which was estimated to cost £66,005 18s., and 24,763yds. of footpath to be flagged at a cost of £6,168 5s. The flagging was to be done with Yorkshire stone 3in. thick, and in places concrete flags would probably be tried.

**Manchester Sewage.**—A Local Government Board inquiry was recently held at the Manchester Town Hall by Mr. E. A. S. Fawcett into an application by the City Council for sanction to borrow £30,000 for sewerage works and £3,000 for the equipment of the Harrison Street lodging-house. It was stated by Mr. Hudson, deputy Town Clerk, that the proposal to borrow £30,000 was in respect of repairs to the Moston Brook culvert from a point known as Green Mount to the river Irk. In August last year the culvert collapsed at Hall's Crescent, Collyhurst, bringing two houses to the ground and seriously interfering with the stability of others. Mr. Wilkinson, C.E., carefully examined the culvert, and recommended the Corporation to repair and considerably strengthen the existing culvert, and to construct a supplementary one, 10ft. in diameter, from near Queen's Road, discharging into the Irk near Smedley Bridge. With regard to the Harrison Street lodging-house loan, Mr. Hudson said the present application was for power to obtain means to equip the establishment.

Trade and Craft.

MILNE'S IMPROVED WATER HEATERS.

We are glad to see that Mr. E. Parker Milne, of 15, Craven Street, Strand, London, W.C., has been granted a special licence by the proprietor of the smoke-consuming and fuel economising fire patents to use the same in connection with his own heating apparatus. The heaters are of different types, sizes, and

MILNE'S PATENT HORSESHOE BOILER.

capacities, and are constructed with water-way flues and cross tubes, specially designed to utilise to the fullest extent all the heat which is generated by the patent smoke-consuming fires, the result being that the circulation of the hot water is very rapid, and, as all the heat products of the fuel burnt are utilised, it follows that a great saving in fuel is effected. The fuel employed is common slack coal, which is practically smokeless. One of the boilers can be used for steam. The three great points about these heaters are the absence of smoke, the absence of soot, and perfect combustion, and these advantages help to make a perfect type of heater, the excellence of which is evidenced by the numerous medals awarded to Mr. Milne.

INSTRUCTIONS TO BOILER OWNERS AND USERS.

The National Boiler and General Insurance Company, Limited, of 22, St. Anne Square, Manchester, have sent us an interesting little work, written by E. G. Hillier, which gives instructions respecting the working, treatment, and care of steam boilers, for the use of those who have charge of and are responsible for them. The work gives good directions with reference to matters which experience has shown to be essential to safety, and also to various precautions necessary for the satisfactory working and the prevention of undue deterioration of the steam-raising plant. The first portion of the notes refers to boilers generally, including "Lancashire," "Cornish," and cylindrical externally-fired boilers. Notes respecting special features of vertical, locomotive, and water-tube boilers are also given. There is no doubt that to attain good results in the working of steam boilers, of whatever type, care and attention are necessary, and the steam boiler should be regarded as a machine requiring constant supervision and care in all details. The book supplied by the National Boiler and General Insurance Company, Limited, is one from which even experienced boiler attendants will be able to cull some useful hints.

BACTOLITE.

Bactolite is not a germ, but a germ destroyer. It is a system of ventilation, patented and invented by Mr. Robert Boyle, of Messrs. Robert Boyle and Son, Limited, of 64, Holborn Viaduct, London, E.C., and is specially intended for use in hospitals. By the use of this admirable invention the disease germs in the air are consumed before reaching the air outside the hospital. The incoming air is warmed in cold weather and cooled in warm. The air is also purified by passage between medicated screens. The illustration shows the working of the apparatus. A is Boyle's patent fireproof "air pump" ventilator; B is the main extraction shaft packed with non-conducting material; C is the double grill filled with perforated asbestos balls, through which the disease germs pass and are consumed; D is a ring of atmospheric burners, the flames of which render the asbestos balls incandescent; E is the fireproof chamber which contains the grills; F is a door which gives access to the chamber for lighting and cleansing purposes; G is a gas pipe; H H are the branch extraction shafts

connected with openings in the ceiling; J is a cone which covers the opening in the ceiling; K is a weighted regulating valve; L L is the door giving access to the extraction shafts for cleansing purposes. In connection with the double grill at C, if required, more than one of these can be put in. All outlets and inlets are easily accessible for cleansing purposes.

BOYLE'S PATENT "BACTOLITE."

## Property and Land Sales.

By EDWIN FOX and BOUSFIELD,  
At the AUCTION MART,  
On WEDNESDAY, JUNE 21st,  
At TWO o'clock, in one Lot.

**CITY OF LONDON.**—Highly Important FREEHOLD ESTATE, comprising the premises so well-known for years past as Boord's Distillery (which business is being removed to premises in Tooley-street), advantageously placed in Bartholomew-close, to which it has a commanding return frontage, and covers the extensive superficial area of over 7,000ft., with the substantial erections thereon, which, however, do not thoroughly utilise the land, occupying as it does a position which could be devoted to more profitable purposes, the district having now become a centre for warehouses, old buildings having to give place to modern commercial erections. The existing tenancy allows time for maturing plans without loss of income. It is let on a repairing lease to Messrs. Boord and Sons, for a term expiring in 1901, at a rent of £800 per annum, lessees paying all outgoings whatsoever.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the

Vendors' Solicitors, Messrs.  
ROY and CARTWRIGHT,  
No. 53, Coleman-street, E.C.

By EDWIN FOX and BOUSFIELD,  
At the AUCTION MART,

On WEDNESDAY, JUNE 21st, at TWO o'clock.

**ENFIELD.**—Close to the centre of the town and station on the G.E. Railway, valuable FREEHOLD BUILDING ESTATE of about six acres, free from tithe and land tax, with approach to the Southbury-road and Fotheringham-road, and presenting much scope for profitable building operations, which have been so successful in conducting to make Enfield one of the most popular places for a medium class of house within a like distance of the City. The facility of transit which the G.E. Railway affords, contrasting as it does so favourably with that of other lines, tends to enhance the eligibility of building land in this district.

Particulars at the Mart; at Messrs. EDWIN FOX and BOUSFIELD's Office, 99, Gresham-street, Bank, E.C.; and of the

Vendor's Solicitors, Messrs.  
BARFIELD and BARFIELD,  
72, Finsbury-pavement, E.C.

SALE DAYS for the Year 1899,  
Messrs.

**FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO.** beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, June 22	Thursday, Sept. 21
Thursday, June 29	Thursday, Oct. 12
Thursday, July 6	Thursday, Oct. 26
Thursday, July 13	Thursday, Nov. 16
Thursday, July 20	Thursday, Nov. 23
Thursday, July 27	Thursday, Dec. 7
Thursday, Aug. 3	Thursday, Dec. 14
Thursday, Aug. 10	

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

To Architects, Builders, and Others.—CITY of LONDON (on the borders of).—An unusually extensive Building Site, occupying an area of nearly an acre.—Messrs.

**FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO.** will offer for SALE by AUCTION, at the Mart, Tokenhouse-yard, E.C., on THURSDAY, JUNE 22nd, 1899, at TWO o'clock precisely (unless previously disposed of by private contract), the valuable FREEHOLD BUILDING SITE, situated in Hearn-street, Finsbury, contiguous to the L. and N. W. Railway Goods Depot, having an area of upwards of 40,000 square feet, adapted for the erection of warehouses or manufacturing premises, or for the creation of ground rents.

Particulars, with plan and conditions of sale, may be obtained of Messrs. TORR, GRIBBLE, ODDIE, and SINCLAIR, Solicitors, 33, Bedford-row, W.C.; at the Mart; and of Messrs. FAREBROTHER, ELLIS, and CO., 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By order of the Trustees of the St. Clement Danes Holborn Estate Charity, High Holborn.—Letting on Building Leases of Valuable Sites for Shops, Trade Premises, and Dwellings.

**THURGOOD and MARTIN** have received instructions to LET by AUCTION, on building Leases, on WEDNESDAY, JUNE 28th, 1899, at TWO o'clock precisely, in Three lots, Nos. 101 to 104, High Holborn, and neighbouring PLOTS of LAND on the east and west sides of Deau-street, well situated in and near the main thoroughfare from the City and West End, on one of the busiest and widest parts, having areas varying from 7,374ft. to 3,121ft. respectively. Very valuable sites for important shops, warehouses, and dwellings.

Particulars and conditions of letting, with plans, may be had of Messrs. J. C. and W. W. ISAACSON, Solicitors, 11, New-inn, Strand, W.C.; H. C. BOYES, Esq., Ormond House, Great Trinity-lane, E.C., Architect and Surveyor to the Trustees; at the place of sale; and of the AUCTIONEERS, 27, Chancery-lane, W.C.

LOWER TOOTING.—Althorpe Lodge Freehold Building Estate.

**MESSRS. FIELD and SONS** will SELL by AUCTION, at the Mart, on THURSDAY, JUNE 22nd, at TWO, the FREEHOLD BUILDING ESTATE, known as The Althorpe Lodge Estate, at the junction of high roads to Merton, Wimbledon, Wandsworth, and Tooting, within ten minutes' walk of Earlsfield Station, and containing an area of nearly five acres, having a frontage to Garratt-lane of about 348ft., and frontage also to Franchcourt-road and proposed roads sanctioned by the L.C.C., Burnester-road and Alden-road. Also Five contiguous Freehold Cottages, Nos. 8 and 12, Edward's-terrace, Garratt lane.

Particulars and conditions of sale, with plan, may be had of F. W. FIELD, Esq., Solicitor, 52, Chancery-lane, W.C.; of Messrs. COOPER and BAKER, Solicitors, 6 and 7, Portland-street, W.; and of the AUCTIONEERS, 54, Borough High-street, S.E., and 52, Chancery-lane, W.C.

**TO LAND SOCIETIES, BUILDERS, and SPECULATORS.**—LEATHERHEAD, Surrey.—Valuable FREEHOLD BUILDING ESTATE of about 10 acres, occupying an elevated site in close proximity to the town and its two railway stations, to be SOLD by AUCTION by Messrs. WHITE and SONS, at the Swan Hotel, Leatherhead, on FRIDAY, JUNE 23rd, 1899, at Five o'clock, in One Lot. The property is ripe for development, and there is a valuable vein of gravel on it available for road making.

For particulars and conditions of sale and plans attached, apply to Messrs. WHITE and SON, Auctioneers, Land Agents, and Valuers; or Messrs. HART, SCARES, and HODGES, Solicitors, both at Dorking and Leatherhead.

**ANSELL and MALLOWS**, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

**R. I. B. A. EXAMS. PREPARATION.**—personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**ARCHITECTURAL Institute, Society of** Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C. 1

**MASON'S CHISEL, STEEL,**  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$ in.,  $\frac{1}{2}$ d. lb.—E. DEALEY, Moore-street, Sheffield. 7

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUTH WANTED** in Builder's office with some knowledge of drawing. Apply, stating full particulars and salary to, "Thirty-six," No. 17, Cornhill. 1

**WANTED**, at a small Terra-cotta Works near London, a thoroughly experienced KILN-SETTER and BURNER (to fill up time with pressing). Abstinence preferred.—Apply, stating terms, to "Kiln," Box, 1074 "BUILDERS' JOURNAL" Office. 1

# BLIZZARD IN AMERICA.

## COPY OF TESTIMONIAL. (Unsolicited).

FRANK MILES DAY AND BROTHER  
ARCHITECTS  
985 CHESTNUT STREET, PHILADA.  
F. M. DAY H. KENT DAY

March 1, 1899.

Mr. George Wragge,  
Salford,  
Manchester, England.

Dear Sir:

Noting your full page advertisement in the "Specification" this morning reminds us that we have been intending for some time to write to you to tell you how admirably your casements in Mr. Newbold's house behaved during the recent blizzard. The storm was one of unprecedented severity, the snow being thirty inches on a level and it was accompanied by winds of great velocity. The snow being very fine and dry, found its way in generally through the slightest cranny. The blizzard was promptly followed by a rapid thaw that set everything afloat and caused quite serious damage through leaks. The conditions were probably the most trying that we remember during the course of our practice. Your casement frames perfectly resisted every force of that storm and the subsequent thaw. No snow whatever entered Mr. Newbold's house either through the doors or windows, nor did any water get in when the thaw came.

This, we think, shows not only the excellence of the goods of your manufacture but the fact that they were well installed by the men under our direction. We are glad to be able to write you this, not only on our own account, but because the Owner of the house particularly wished us to express to you his satisfaction with your work.

Yours very truly,

*Frank Miles Day & Bro.*

The above *UNSOLICITED* Testimonial refers to a very important order for upwards of 250 BRONZE CASEMENTS supplied to Mr. Newbold's Mansion, Philada. U.S.A. The sections used were Nos. 20, 22 and 24, illustrated in our NEW CATALOGUE, pages Nos. 10, 14 and 18 respectively.

## An Architectural Causerie.

### The Art School at Westminster.

ART is studied at a public art school from very different standpoints and by very different classes of people, but the line between the classes is at once easily drawn, if the school provides tuition and models by night as well as by day. The day students, the majority of whom are women, study art for art's sake; that is to say, they wish to be what they are pleased to call artists (ignoring the significance of the term!), and the next best thing to being an artist is to be a student of art! It is with such feelings that they clothe themselves with the romance that surrounds the palette and paint brush; make studies from the nude and the costumed model, and work them up into sketches, which they display at the sketching club exhibition every month. If the visitor were to happen on an exhibition of sketches at the monthly criticism, he would find it difficult to form a criterion of the school work. It ought to be a fair means of judging, but the ordinary student work far surpasses the results as shown in their sketches. Their life studies are very good and vigorous, not so their sketches. There is occasionally a nice landscape from one of the men, a man who affects cobalt tones to a pitch of dullness; and there is occasionally some fair figure work or composition in designs for posters or subject sketches, but the average of attainment is low—report says that the president has more than once refused to look at them—and their designs for objects of furniture and so forth are beneath contempt. But, taking it all round, the women draw very well, and no school has a better record than Westminster. The male student at the day sittings have high ideals; portraits at the Royal Academy are their ambitions; but they are not really ambitious; art life is taken too easily by them; they are not punctual; their hearts do not seem to be in their work; and we know—for has not Mozart told us about his art?—that the hand and the head are useless without the heart. The room, one of the old ones, in which they paint, is not an ideal place; perhaps their surroundings are depressing; but Art has flourished under worse circumstances than theirs. Mr. Londar, the headmaster, teaches as well as he paints; and no more praise need be given to the painter of that picture of 1897 called "Butterflies" than that. And the master of modelling has also won laurels on more occasions than one with his chisel. The other class of student is the night

student. He works at the school for professional reasons. These students are men who earn their livelihood by professional art during the day and improve upon their possibilities of future success by night. They are painters of glass, designers of wall papers and fabrics, architects, architects' assistants, and such like. They are people to be admired; they work in their offices from 9 a.m. to 6 p.m. every day, and snatch two hours, from 7 p.m. to 9 p.m. in the evenings. They are hard workers, enthusiasts, and, for the most part, good draughtsmen. They generally begin at the lowest rung, and climb the ladder till they reach the life class: geometrical drawing, casts of fruit, casts of architectural detail, casts of classic heads, then the Venus of Milo, and the last the life class. These are the rungs of

latter largely predominates. So many people labour daily and well to no purpose. Their work gets worse. They have missed their vocation, and yet they struggle on, disfiguring more and more the subtleties of the antique. Nothing will alter their purpose, not even the advice of the head master. There are few of these misguided enthusiasts at Westminster. It is a school that is improving, and a school that should be encouraged, and may those in authority remain there long to maintain the standard to which they have energetically raised it. E. B. H.

### Wanted: A Central Shelter for London's Exhibitions.

ONE feature of London life is the endless succession of exhibitions, big and little—a natural outcome of our position as the metropolis of the world. But it is

ST. MARY MAGDALEN'S CHAPEL, RIPON. SKETCHED BY E. BECKITT LAMB.

Art toiled up by the students at the night classes. Their aspirations are mostly professional, except for the occasional trifter who centres all his ambitions on a post on the staff of a comic illustrated paper. These students are the most industrious of all. One of them does excellent copper-plate etching, and his name is in the Academy list this year; another designs papers for the best wall paper manufacturers. Another is a stained glass artist, and they live by art far more than the day students. The number of women is far above the number of men. They are too fond of making tea to be real hard workers. Their tea club represents an original ready-money-pay-when-you-like system which must surely be the product of the brain of a real artist. All schools have their humorous and their pathetic side. The

equally characteristic of our happy-go-lucky ways that no fitting provision has been made for the suitable shelter of such shows, which vary from an exhibition of missionary relics to a glorified display of all that pertains to the grand art of gastronomy. True, we have the Royal Agricultural Hall—gaunt, draughty, and uncompromisingly hideous—in far off, erstwhile "happy" Islington. People go there when they are attracted by the dual allurements of satisfying charity and a love for brilliant uniforms and deeds of daring. Fashion will not mind a tiresome pilgrimage to the same spot when devotion to horseflesh or to the canine race is in question. Of course, John Barleycorn and his cousins flock to the hall to take part in the October drink saturnalia. The farming and trading interests will put up with the incon-

veniences of Islington when fat bees, golden butter, or commercial shows are on. But for other things Islington is too far away from the haunts of rational beings, and the hall too incorrigibly unadaptable to be of much use. Olympia also is too far away, has a deplorable reputation for flatness of results, and besides, has long been given over to wild beasts. The inertia of South Kensington hangs over the Imperial Institute, which, moreover, is badly designed for exhibitions (and for most other things). At the lately held Universal Cookery and Food Exhibition, the Northern Gallery of the Institute proved far too narrow for comfort or serious study of the great artistic efforts of chefs and the wondrous audacity of gastronomic chemists. Visitors were crushed and confined, deafened by the fitful blare of the band of the Horse Guards (Blue), and bewildered by the weird gesticulations of white-capped chefs and chefesses as they demonstrated the mysteries of *ragout* manufacture, or the trick of pancake tossing. Niagara Hall is delightful for some purposes; but, it has its limits. After that, what have we left? Very little. A certain exhibition of medical appliances was once held in Drury Lane Theatre. How could one ponder over the grandeur of bone-saws, the charms of antiseptic silk for skin stitching, or the potentialities of mustard plasters with the indecorous attributes of Thalia and Melpomene on all sides? What is really very much wanted is a specially-designed building, in a central position, easily get-at-able from all parts of London. Now, if we are to have a broad thoroughfare uniting Holborn and the Strand, it will be necessary to adorn it with sufficiently imposing edifices, and we would suggest that one of these new structures should take the form of Exhibition Buildings. The proposed structure would contain a large exhibition room, which could be mapped out as each case may render most desirable. A Promenade Refreshment Gallery would give visitors a good bird's-eye view of the scene, and place the hungry where they could enjoy themselves undisturbed. The dining-room and café lounge would be covered over with glass and decorated with palms. In addition to the main room there should be an annexe and a circular hall and gallery. These could be taken into the exhibition if more space was required. For lectures and demonstrations a room quite out of the hurley-burley should be arranged. Provision should also be made for outdoor exhibits, such as savage camps, wild animals, and *al fresco* catering. In such a building three separate exhibitions and a series of lectures might be going on contemporaneously without interfering with each other. Or the whole establishment could be given over to one show. By the arrangement of communications and provision of offices the space available could easily be adapted to almost any size or class of exhibition, and this is precisely what London stands so greatly in need of to-day. Whether the London County Council ought to provide such a building, or whether the venture should be left to private enterprise, is a question that need not be discussed here. For the present our aim is to call attention to a want, and to point out how it can be supplied when we are given the much talked of avenue from Holborn to the Strand.

G. C. R.

## OUR COMPETITION.

WE are pleased to be able to announce that Mr. Edward S. Prior has consented to act as Assessor in the Competition recently held for Designs for a Country House. We hope to publish the awards in an early issue.

## On Reflection.

### Registration of Architects.

THE most notable feature of the correspondence on this subject that has been appearing in our columns during the past few weeks is the practical unanimity of the views expressed. By different roads our correspondents nearly all arrive at the conclusion that registration is a desirable thing. The opponents of the proposed reform seem—with one or two exceptions—to be too half-hearted or indifferent to take the trouble to combat the views expressed by our correspondents. That being so, it might be supposed that registration may be expected to become an accomplished fact within a very short time. But the R.I.B.A. blocks the way. Why the Institute as a body should oppose a reform of which many, perhaps a majority, of its individual members approve it would be hard to say. One of our correspondents made the rather cynical suggestion that the reason is to be found in the fact that this particular reform is strongly advocated by another professional society. We should be sorry to believe that the representative body of British architects could be actuated by so paltry a motive. But whatever the reason,—the fact remains, and until the Institute supports the proposed reform there is little chance, we fear, of its being carried out. It was suggested by Mr. Aston Webb at the dinner of the Architectural Association a few weeks ago, that the Institute is not the immovable ultra-conservative body some suppose it to be, but that it is quite prepared to move with the times. In this matter of registration the Institute has an excellent opportunity of showing its progressive tendencies—if they exist. Without going quite the length of those of our correspondents who maintain that the arguments for the registration of medical men and chemists apply with equal force to architects, we are nevertheless fully convinced that registration is a reform demanded in the interests both of the profession and of the public.

### Some Objections Considered.

THE proposal for registration is sometimes opposed from diametrically opposite standpoints. On the one hand there is the so-called "art architect" who objects to having to pass technical examinations; his business is to make beautiful designs, not to supervise the laying of drains. On the other hand there is the "practical man" whose point of view was explained with much force in our columns last week; his knowledge, gained in the actual carrying out of building operations, is—he maintains—superior to the merely theoretical knowledge of the young architect who, after three years' apprenticeship, may pass his qualifying examination. We cannot see that such proposals as those embodied in the Bill of the Society of Architects would injure either of these classes. The artistic designer and the practical builder would not be less needed, nor, it may be hoped, less appreciated if they ceased to call themselves architects. The "architect," according to the derivation of the word, is the "master builder," and we cannot see why the man who devotes himself exclusively to decorative work should not call himself an artist or designer rather than an architect. The man who can design beautiful windows or wall papers or book covers, but knows little and cares less about building materials and sanitary details, may fill a high and useful place, but it only leads to confusion, and serves no useful purpose for

him to call himself an architect. The builder, too, will not lose, under a system of registration, any work that is legitimately his. He may still carry out buildings for himself or for a client without the intervention of an architect. But he will not be allowed to call himself an architect, or to recover architect's fees. The client who employs him will do so with his eyes open; he will know he is employing a builder not an architect; there will be no false pretences in the matter, and that is a gain all round. The occasional efficiency of the unqualified man is no argument against a qualifying test. The chemist or clinical assistant may correctly diagnose your disease, but he is not allowed to describe himself as a physician or to charge for his advice. The able-bodied seaman may acquire much practical skill in seamanship and navigation, but the only road to a captain's berth is by way of the Board of Trade examinations. The honest builder has nothing to fear from the registration of architects. The great advantages of the measure would be that it would protect the public against quacks, and raise the status of the architectural profession, provided always that care is taken to make the qualifying examination a real test of competency.

### The Architect's Responsibility.

A QUESTION of considerable importance to architects was raised by an action recently brought before the Edinburgh Court of Session. An Edinburgh architect of good standing was employed by a lady client to build her a suburban villa. According to the evidence, he took a good deal of trouble on his client's behalf, but in the important matter of the supervision of the work in progress he seems to have taken a somewhat lax view of his responsibilities. As many architects have done before, he trusted to the contractor to carry out his instructions satisfactorily, and contented himself with an occasional visit once a week or once a fortnight. This is a plan which may answer very well when the contractor is thoroughly reliable, and carefully supervises the work of his men. In this particular case, however, it turned out disastrously. Instead of making the "bottoming" for scullery and coal cellar as specified—that is say, of broken stone covered with small stones and "dry stone filling"—the builders used, at any rate, for the uppermost 3in. or 4in., any miscellaneous rubbish that came to hand, shavings, pieces of wood, sacking, plaster, and so on. The result of this scamping was that dry rot developed on the pieces of wood that formed part of the bottoming, and quickly spread to the doorposts embedded in it, and thence to other parts of the woodwork of the house. As the client had been obliged to spend about £30 to eradicate the evil, and as it seemed impossible to decide whether the mason or the carpenter was most to blame, she sued the architect for damages for breach of contract. Lord Kyllachy gave judgment for the plaintiff, and assessed the damages at £40 with costs, on the ground that the architect had not exercised reasonable supervision over the work. On the face of it there might seem to be a certain amount of injustice in holding the architect responsible for the delinquencies of the contractor's workmen. But, seeing that his fees are understood to cover payment for supervising the erection of the building, it is only reasonable to demand that that supervision shall be real and effective, and most people will agree, we think, that Lord Kyllachy's decision is as equitable as it is no doubt good in law. It may be safe at times to leave things to the contractor, but the architect must accept the responsibility if he takes the fee. Clients cannot be expected to pay for merely nominal services.

## ROUND ABOUT RIPON AND YORK.\*

BY JAMES MCKISSACK.

THE apprentice to Architecture has to do a lot of hard work to enable him to occupy the responsible and important position of architect. Among other things, he has to do a lot of measuring and sketching of old and good work. In Glasgow district he is to a

After breakfast on the day following our arrival at Ripon we had a walk round the town. We found nothing of any interest architecturally here, the old domestic work having all been taken down to make room for the more modern buildings which are very commonplace. After a look round we made our way to the cathedral or minster as the towns folk delight to call it. It is situated in Kirkgate.

Our first view of the cathedral was the west front of which I will speak later. The west doors being closed we took a look round it.

Walker de Gray (1250-60) whose beautiful tomb is in York Minster. It consists of a central compartment with three doorways and two tiers of windows rising to a gable between the western towers.

The façade is severely simple as a composition, and its somewhat monotonous effect is scarcely relieved by a sparing use of the dog-tooth ornament. The parapet and pinnacles of the towers were added in 1797, the leaded spires having been previously removed lest, like the central spire, they should be struck by lightning. Entering the nave, we sought

GODDRAMGATE, YORK. DRAWN BY F. L. GRIGGS.

great extent limited for old work; he must work at the cathedral, which is undoubtedly worth study, or else travel some distance to get into some part of the country that is richer in old architectural work. It was with this object in view that the Glasgow and West of Scotland Technical College Architectural Classes started a series of visits to different buildings of architectural interest. The following notes relate to a holiday in Yorkshire, spent last summer by a party of four students. We proposed taking Ripon as the centre for the first week and York for the next.

\* A paper read before the Glasgow Architectural Association.

Going along the north side and round to the south-east we came upon what is undoubtedly the best general view of the cathedral; the river in the foreground is the Skell, a tributary of the Ure! We see the full length though the lower part is hidden. I think the view is all the better for not being uninterrupted, because the presence of the humble roofs in the foreground serves to increase the apparent height of the naves, transept, and choir, and to relieve the squatness now given to the building by its spireless central and western towers. Coming round to the west we found the door open, but before going in we had a look at the west front. It is early English and assigned to Bishop

out the vergers, and presented our permits to sketch, measure, and photograph. We then separated, and started to work at once. The windows in south aisle of nave are of Perpendicular work, earlier in character than those of the north aisle. At the south-east angle of the south transept there are the Chapter House and Lady loft. The Chapter House on the ground floor is of Norman work, and the Lady loft above is early Perpendicular in style. The Lady loft is now used as the cathedral library. The south transept is also perpendicular. Then the east end of the Chapter House and Lady loft is noticeable for the square end of the Lady loft sitting on the round apsidal end of the Chapter House. The

SKELTON CHURCH, FROM THE SOUTH-EAST. DRAWN BY JOHN RALSTON.

east end is early decorated, and the east window a very fair specimen of geometrical tracery. The stalls are very good, being of fifteenth century work; the finials of the sedilia in the choir appear somewhat heavy.

Another of our visits was to the Lepers' Hospital, one of the few remains of old work in Ripon. The next day we proposed to go to Fountains Abbey. As the Abbey is situated four miles out of Ripon we cycled there, so as to have as much time there as possible. It is on the Marquis of Ripon's estate, and before reaching it we had to go through Studley Royal, which also belongs to the Marquis. Going out of the direct road to the abbey we went to see the new church, which was erected in 1871 by the Marchioness of Ripon. The architect was the late Wm. Burgess. I must confess that I was extremely disappointed with this church. The building seems to lack proportion, the tower, which is over 200ft. high being, I think, too lofty for the small church. The chancel is overcrowded with windows which do not help the appearance generally. The details are very good—in fact, I think the most satisfactory feature of the building. The interior is most ornate; in fact, too much so. We now found our way back to the main avenue to get to the lodge gates. Here, on payment of one shilling, we had the free run of the abbey without the bother of guides. The distance from the lodge to the abbey is one mile, which we had to walk, as cycling was not allowed. The avenue is along the banks of the Skell. The grounds are laid out with ponds, statues, and temples—an arrangement which does not, I think, help the natural beauties of the place. We soon got our first view of the abbey, which is called "the surprise view." This view seems to me to be over-praised, as the river at this point is more like a canal than anything else, and the east end of the abbey is seen, which does not group so well with the tower.

As we get nearer the view is more pleasing. One cannot help wondering on looking on this immense ruin what it must have been like in the past. The abbey from the south-east shows the east end and tower beyond. The chapel of the nine altars is placed at the east end, similar to the one at Durham Cathedral. The tower is not over the crossing, but is placed to the north side of the north transept. The tower is, I think, the most interesting feature in Fountains. It is 168ft. high, and was only finished a few years before the dissolution of the monasteries. Then the tower from the south shows admirably the grouping with the monastic buildings in the foreground. The view from the south-west is also very pleasing, showing the fine grouping of the tower with the abbey. The most striking

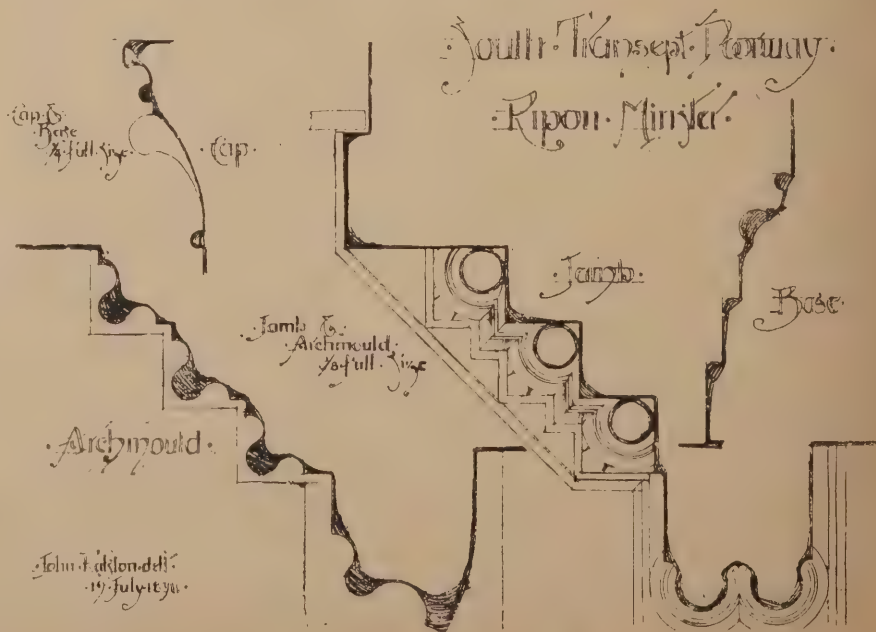

feature of the cloister garth is the quartette of Norman arches on the east side, connecting it with the chapter house. The Galilee porch is situated at the west end. Three arches of an open arcade alone remain of this interesting example. This porch was used for burials and also marked the limits beyond which females were not allowed to transgress. The chapel of the nine altars is considered by some to be the gem of the abbey. It is oblong in form and extends from north to south, and forms the east end of the church. It is like the similar example at Durham of earlier date. The great cloister or cellarium is 300ft. long by 40ft. wide, and is divided into two corridors by a row of nineteen columns. These columns have no capitals.

After having exhausted the abbey, and I think we did it fairly well, we went to have a look at Fountains Hall. It was built out of the ruins of the abbot's house or infirmary. We then returned to Ripon, well satisfied with our day's work and the things we saw. On Sunday we rested, and on Monday went for a circular tour. We left Ripon in the morning, and proceeded to Ripley. The church here is small and fairly interesting; the tower is rather quaint, and out of the usual run of village church towers. The castle is the seat of the Ingilby family, and was built in the reign of Mary. Remounting our machines, we now proceeded to Harrogate. As there was nothing of interest there we pushed on to

Knarborough. On the way we passed some very good modern houses. The situation of Knarborough is extremely picturesque, and in this respect, as well as its comparatively old-world appearance, the town stands out in bold contrast to Harrogate. The church is fairly large and interesting; the tower especially so, with its slender wooden spire. All the periods of architecture from Early English to Perpendicular are shown. The castle stands high, and overlooks a picturesque bend of the River Nidd. It owes its ruinous condition to a six weeks' siege which it endured from the Roundheads, in 1644. After spending about three hours here we continued our route, and arrived at Aldborough.

This is an old Roman town, and remains are to be seen all over the village. The church is fairly interesting. There is an old half-timbered house with the old village cross in front. The cross is early English, of clustered columns braced together. We then proceeded to Boroughbridge. This is an old-world place which saw its best days when the coaches went through it. The church is modern and extremely good in the detail. Here we reached our last stopping place for the day. On the following day we stayed in Ripon and did more work at the Minster. On Wednesday we proposed going to Jervaulx Abbey. On none of our previous rides had the scenery been particularly interesting, but this day we got a surprise. West Tanfield, our first stopping-place on the way, being one of the prettiest villages I have ever seen. The situation is charming. It stands on the left bank of the river Ure, with its little church tower and castle standing above the village and river. The colour in this view is simply grand. The church is extremely interesting. It has a squint close to the chancel arch. On the left of the church stands a tower which is interesting as the remains of Marmion Castle—the home of Sir Walter Scott's "Marmion." Above the gateway there is a beautiful little oriel. The tower is of Perpendicular work. Proceeding on our way we came to Masham—a very picturesque town with a large market-place, at the south-east corner of which stands the church. The most striking external feature of the church is the tower, Norman in its lower, octagonal in its upper part, and surmounted by an admirably proportioned spire.

Five miles beyond Masham we came to Jervaulx Abbey. There was not much remaining here, and if this had been the sole object of our day's visit, it would have been a day lost. Lovers of Scott need not be reminded that the jovial Prior Aylmer (mentioned in "Ivanhoe") hailed from Jervaulx. Having still some time left we continued on to Middleham, which is another picturesque town that is well worth being visited by artists. It has a huge old castle of more historic than archi-

OLD PULPIT, NORTH TRANSEPT, RIPON  
MINSTER. DRAWN BY JOHN RALSTON.

tectural interests. We then returned to Ripon by the same route. During the evening we were shown the gold plate belonging to the cathedral. Most of it belongs to Charles II.'s reign, and is very good.

On the following day, Thursday, our destination was Bolton Abbey. It was almost twelve o'clock before we got started and proceeded by Ripley till we met the Skipton Road. Until this day we had not met a hilly road and had begun to think there were no hills in England. We soon found out our mistake as the road to Bolton Abbey is something awful, at some parts being over 1000ft. above sea level. We took four hours to go twenty-six miles against a strong wind. We arrived at Bolton Abbey about 3.30. The situation of the abbey is simply grand and quite made up for the long ride. The river Wharfe runs round it, and it is a most picturesque stream. The grouping of the abbey is disappointing, the loss of the west tower spoiling the effect completely. The nave was restored by the late G. E. Street in 1864.

The west front is of very good Perpendicular work in splendid condition. The west door to the north aisle is of very good early English work. The arcading in the choir is noticeable for the continuous panel of waving tracing over the Norman arches. The river Wharfe is crossed by fifty-six stepping stones, probably the longest causeway of this kind in the kingdom. Owing to our late arrival at the abbey we did not get quite as much work done as we would have liked. We intended coming back by Otley and Ilkley, but had not the time to spare as this would have added four miles to our journey.

The next day we intended to go to Rievaulx Abbey. The morning was fine when we set out. The way lies through Thirsk, and here we stopped for about two hours to see its famous church. It is Perpendicular throughout and was restored by the late G. E. Street in 1874. The tower is supported by staged buttresses, and is surmounted, as also are the clear-story and aisles, by fine pinnacles. All round on tower, clear-story and aisles are prominent grotesque gargoyles—beast, bird, and humanity mixed in the most hybrid fashion. The roof is of Irish bog oak, and with its fine bosses and shield bearing angels is one of the features of the church. A new stone font stands under the old canopy. There is some fine old glass here. Our way was now through the pretty little village of Sutton, and over the Hambleton Hills to Rievaulx. After leaving Sutton the roads began to be hilly, and one and a half miles out there is a rise of 560ft. in one mile. The view from the top is very fine, and looks over the Vale of York. Arriving at the top we found the roads very bad—little better than a sheep's track. The situation of the abbey is extremely beautiful;

in fact, I cannot conceive the old Cistercian Fathers choosing a more Heavenly spot. The thought evoked by the first sight of Fountains was the glory of its past—with Rievaulx it was the beauty of its present. The remains consist of the choir, roofless but otherwise in excellent preservation, the transept, the refectory, and fragments of domestic buildings. The side of the nave is now marked by shapeless mounds which cover its ruins, and the pits here and there indicate what the village so clearly shows—that it has been used as a quarry. The choir, which recalled to us the one at Glasgow Cathedral, is exceedingly fine. It is of the finest Early English work. The mason work, exposed as it is to storms of wind and rain, looks as fresh as if it were just from the mason's chisel.

The following day, Saturday, was to be our last day at Ripon, as we intended to leave for York that day and there spend the remainder of our holidays. We had a farewell walk all round the town, and visited the minster before leaving. We did not get to York till about 3 p.m. As we neared this grand old city it was bathed in sunshine, and the green colour of the copped north transept roof of the cathedral helped to make our first impression of the place favourable. We first walked through the city to the cathedral and then sat and admired the enormous pile. There was so much to see in it that we could not think of working that day. Our first impression of the west front was that it was overcrowded with ornament and detail. Our guide book said that it was unequalled in style and decoration in the kingdom. I am not sure whether this is the case or not, as I have not seen all the cathedrals yet. The Early English work in the north transept pleased us better. The corbels on the south side of the nave are splendid examples of natural foliage and are all different. The south transept is of very good Early English work—the details excep-

tionally so. It was a relief to come on the chapter clerk's offices. They are so simple compared with the rest of the building and are a very good example of domestic Gothic. St. Cuthbert's window is 72ft. high, and has the appearance of a second transept, though it does not project beyond the aisle. We now came to the gem of the cathedral—the north transept, with its five sister windows. The lights are all of the same dimensions, 53ft. by 5ft. They retain their original glass of a diaper pattern, and remarkable for its subdued silver-grey tint.

The Chapter House is octagonal. The windows are good examples of decorated work. There are some fine carved canopies in the interior, and there is no central shaft. The height is 67ft., and diameter 42ft. The nave is the largest in England, being 210ft. long, 103ft. wide, and 93ft. high. The west window is a good example of late decorated tracery. It is not unlike the oak leaf in character. The choir is perpendicular, and is very good. The feature is its great east window, with its many flimsy mullions—more wonderful than beautiful. The minster library is of good Early English work.

The next thing of interest at York is St. Mary's Abbey, which stands in the grounds of the Philosophical Society. There is not much remaining of it except the north aisle of nave. What remains shows that it may have been a very fine building. There is an antiquarian museum in the same grounds, which contains many Roman remains. Not far from the cathedral on the west side is an old Jacobean palace, now used as a school for the blind. The walls of the city are interesting with their old gates, or bars as they are called. A walk round them gives one a good idea of the old city. The old churches in York are numerous, and particularly good, but they are mostly in such bad positions that it was almost impossible to get photos of them. St. Margaret's, in Walmgate, has a fine Norman

SEDILIA, FROM RIPON MINSTER. DRAWN BY JAMES BROWN.

## NEW CHURCH AT EALING.

ON Wednesday last the new church of St. Saviour, which has just been erected at Ealing from the designs of Mr. G. H. Fellowes Prynne, of Westminster, was consecrated by the Bishop of London. Being a mission church, situated in the midst of humble dwellings, an elaborate and costly building was not to be expected, and the new church—especially as regards its exterior—is for the most part extremely simple. Nevertheless, it presents several interesting architectural features. The church is built of red brick with stone facings; a copper covered *flèche*, rising to a height of 46ft. above the roof, is the most striking feature of the external design. On entering the building the visitor's attention is at once arrested by an elaborately carved oak rood beam surmounted by a sculptured representation of the Crucifixion. Some objections, we understand, are entertained against this rood beam on ecclesiastical grounds, and attempts are being made to have it removed. With that aspect of the matter we are not concerned, but on purely artistic grounds we may express the opinion that the removal of this beautiful and impressive architectural embellishment would be a grave mistake.

With the exception of the rood beam, the whole of the woodwork in the church—doors, roof, and furniture—is stained green. This gives a very pleasing effect, and harmonises well with the red brickwork.

The roof of the chancel is to be decorated at some future time when funds allow, and the same remark applies to the plain plastered panels round the walls of the nave. Another contemplated embellishment is the placing of figures of the twelve apostles on niches provided for them on the splay of the nave walls at either side of the chancel arch. Only one figure—that of St. Peter, which has been presented by his architect—is at present in position. When the whole of the decorative work has been completed in accordance with the architect's designs, the interior will present a very rich and beautiful appearance.

The nave is 113ft. long by 40ft. wide, and has an apsidal-ended baptistry at the west end. Properly speaking, there are no aisles, but wide passages are provided on either side of the nave. Leading from the south transept is a small apsidal-ended chapel. Galleries for organ and musicians are placed on either side of the chancel. The cost of the church, including the fittings, has been about £12,000. Messrs. Goddard and Sons, of Farnham, were the contractors. The heating is by hot water, and the building is lighted by electricity.

The consecration ceremony aroused consider-

able interest in Ealing, some of the streets in the neighbourhood of the church being decorated with flags. After the service a luncheon was held at the Victoria Hall, presided over by the vicar of the parish, Rev. W. Templeton King. The Bishop of London gave the toast of "The Building Committee," and Mr. Henry Hall, in responding, gave some particulars of the progress of the building scheme. He explained how the committee had chosen their architect. A small sub-committee, appointed to visit churches in the neighbourhood of London, reported that they approved of Mr. Fellowes Prynne's churches more than of any others they had seen, especially mentioning the church of All Saints', Dulwich, and the one erected for Sir Edward Clarke at Staines. Mr. Prynne, accordingly, was instructed to prepare sketches, which were unanimously approved and adopted. Mr. Prynne had made church architecture his special study, and he thought they might feel justly proud in knowing that the church had been designed and carried out by so distinguished a member of the architectural profession; the result of Mr. Prynne's work was a building of admirable proportions, simple, dignified, effective, well lighted, well warmed, and of excellent acoustic properties. He concluded by proposing the health of Mr. Prynne.

Mr. Fellowes Prynne, in responding, said that an architect was greatly dependent upon those who helped him in carrying out the work. The contractors, Messrs. Goddard and Sons, were a well-known firm of church builders, having carried out sixty or seventy churches, including two of his own, and he had every confidence that their work would stand for many years. He also gratefully acknowledged the services of the clerk of works and the workmen. The difficulties with which the architect was encumbered were not realised, said Mr. Prynne, by the general public. One day the church architect had, perhaps, a client who wished to build with one sole aim—the glory of Almighty God. Most builders of churches, he was glad to say, belonged to this class. But there was another class who wished to make their building a mere whitened sepulchre, a mere brick or stucco building, void of Art or symbolism, which could not foster religious feelings. They must agree that Architecture had an enormous influence on devotional feeling. They could not go into the cathedrals and churches of England without feeling at least the spirit that inspired the ancient architects in raising such structures to the honour and glory of God. Some there were who, not content with living and worshipping in their white-washed walls, wanted to drag the

TOWER FROM SOUTH, LOOKING OVER THE RUINS, FOUNTAIN'S ABBEY. DRAWN BY JOHN BALSTON.

porch. Nearly all the churches contain old glass. The old streets are interesting, and many a picture can be got, notably in the Shambles, the Pavement, Stonegate, Goodramgate, &c. There is a good half-timbered house in Stonegate. In many of the narrow streets round the cathedral a glimpse of the towers of the minster is seen, giving the place an old world appearance. St. William's College on the east of the cathedral is interesting and is now used as a tenement for the poorer classes. We stayed in York until Thursday night, the 29th. On the Sunday night we walked out to Skelton to see the little church there. It is four miles out of York in the direction of Thirsk. It was built about the same time as the north transept at York. It is a beautiful little church. On Tuesday afternoon we took advantage of an excursion to Whitby. We found it a most picturesque place, very unlike the usual English watering-place. The abbey has a most unique situation; instead of lying in a cool, sequestered spot, it stands overlooking the sea, 200ft. above sea-level, exposed to "every airt the wind can blow." The remains are principally of Early English work and are very much ruined. The north transept and east end are very fine.

**The New Catholic Cathedral**, near the Victoria Station, Westminster, will shortly be finished. Over £88,000 has already been spent on its construction, and it is estimated that double that amount will have been spent by the time it is completed.

**Memorial Reading Desk at Little Wenlock.**—A carved oak reading desk has just been placed in the parish church at Little Wenlock, Shropshire, in memory of the late Rev. Canon Nash, for nine years rector of the parish, who died last year. It has been erected by the parishioners with the help of Lord Forester, patron of the living, and other friends of the late Canon. The reading desk has moulded and panelled standards and open tracery between, surmounting a closed panel, which bears a suitable inscription cut in the oak. The whole is of very solid workmanship. It has been designed by Mr. W. Arthur Webb, A.R.I.B.A., of 2, Colville Square, W., and carried out by Mr. T. Martin, of 118, Victoria Street, S.W.

THIRSK CHURCH, YORKSHIRE, FROM THE SOUTH.

architect and others down to their own white-washed level. Some would even wish to banish the very symbol of Christianity. Surely the first thing seen on entering a church should be the glorious symbol of our religion, that, in kneeling to worship, our thoughts should be led to the great Divine sacrifice for men, that, passing under the Holy Rood, we may be reminded that through the sorrows and suffering of the Cross alone can we hope to enter into the enjoyment of the highest blessings beyond. If he had added, or should add in the future, any devotional feeling through the building of that church, he could say from the very bottom of his heart he was amply and fully rewarded.

Other toasts followed.

## R. I. B. A.

### ELECTION OF COUNCIL, STANDING COMMITTEES, &c.

(Continued from page 284, No. CCXXVII.)

THE first business done at the meeting of the Royal Institute of British Architects, on the 12th inst., Mr. John Slater presiding, was to receive the report of the scrutineers appointed by the annual general meeting to direct the election of the Council, Standing Committees, &c., for the year of office 1899-1900. The result of the election has been as follows:—

*President.*—Mr. William Emerson.

*Vice-Presidents.*—Messrs. J. McKean Brydon; W. Milner Fawcett, M.A.Cantab, F.S.A.; H. L. Florence; E. A. Gruning.

*Hon. Secretary.*—Mr. Alexander Graham, F.S.A.

*Members of Council.*—Messrs. F. T. Baggalay; Thomas Blashill; James Brooks, Past Vice-President; J. J. Burnet, A.R.S.A. (Glasgow); W. D. Caröe, M.A.Cantab, F.S.A.; T. E. Colcutt; J. A. Gotch, F.S.A. (Kettering); E. T. Hall; H. T. Hare; E. W. Mountford; Beresford Pite; John Slater, B.A.Lond.; R. Phené Spiers, F.S.A.; H. Heathcote Statham; Leonard Stokes; Sir John Taylor, K.C.B.; Paul Waterhouse, M.A.Oxon; Aston Webb, A.R.A., F.S.A., Past Vice-President.

*Associate-Members of Council.*—Messrs. J. Sivewright Gibson; H. V. Lanchester.

*Representatives of Allied Societies.*—Messrs. D. Barclay (Glasgow Institute of Architects); R. Isaac Bennett (Manchester Society of Archi-

CORBEL FROM CHOIR, YORK MINSTER. DRAWN BY JOHN RALSTON.

itects); J. Crocker (Devon and Exeter Architectural Society); Thomas Drew, R.H.A. (Royal Institute of the Architects of Ireland); Robert Evans (Nottingham Architectural Society); C. B. Fowler (Cardiff, South Wales, and Monmouthshire Architects' Society); W. Glover (Northern Architectural Association); A. E. Sawday (Leicester and Leicestershire Society of Architects); J. Smith (Sheffield Society of Architects).

*Representative of the Architectural Association (London).*—Mr. G. H. Fellowes Prynn.

The following members were declared duly elected to serve on the Standing Committees for the ensuing year of office:—

*Art Standing Committee.*—*Fellows:* Messrs. J. Macvicar Anderson, F.R.S.E.; James Brooks; J. M. Brydon; W. D. Caröe; Ernest George; H. T. Hare; E. W. Mountford; H. H. Statham; Alfred Waterhouse, R.A., LL.D.; William Young. *Associates:* Messrs. R. S. Balfour, J. Sivewright Gibson, H. V. Lanchester, A. N. Prentice, W. H. Romaine-Walker, J. W. Simpson.

*Literature Standing Committee.*—*Fellows:* Messrs. John Bilson; H. L. Florence; Alexander Graham; B. Ingelow; J. Tavenor Perry; W. A. Pite; Sydney Smirke; R. Phené Spiers; H. H. Statham; Paul Waterhouse. *Associates:* Messrs. A. S. Fowler, M.A.Oxon, F.S.A.; J. H. Jones, B.A.Lond.; A. N. Prentice; R. Elsey Smith; L. Waterhouse, M.A.Cantab.; P. S. Worthington, M.A.Oxon.

*Practice Standing Committee.*—*Fellows:* Messrs. T. Batterbury, S. Flint Clarkson, T. Harris, G. Hubbard, A. H. Kersey, J. Douglass Mathews, W. Hilton Nash, Beresford Pite, J. Osborne Smith, E. Woodthorpe, M.A.Oxon. *Associates:* Messrs. W. H. Atkin-Berry, C. H. Brodie, H. Hardwicke Langston, Sydney Perks, A. W. Tanner, W. H. White.

*Science Standing Committee.*—*Fellows:* Messrs. L. Angell, M.Inst.C.E.; Delissa Joseph; H. W. Pratt; J. S. Quilter; H. D. Searles-Wood; Percival Gordon Smith; A. Saxon Snell; Lewis Solomon; W. C. Street; Benjamin Tabberer. *Associates:* Messrs. S. B. Beale; H. W. Burrows; Max Clarke; B. J. Dicksee; Matthew Garbutt, Assoc.M.Inst.C.E.; Charles Henman.

The hon. auditors for the past official year, Messrs. Zephaniah King and Frederick William Marks, were re-elected for the ensuing year.

It was then decided on a motion of Mr. H. Hardwicke Langston, that in the opinion of the meeting it was desirable to put a suitable and prominent inscription on the street front of 9, Conduit Street, indicating that those premises were occupied by the Royal Institute of British Architects.

The meeting then passed to the consideration of the report printed in our issue of last week, of the special committee appointed by the council to consider the administration of the building by-laws in non-metropolitan districts. After some slight discussion the report was passed *nem. con.*

The Chairman then moved the following resolution, passed by the Special Committee and approved by the Council: "That the Royal Institute of British Architects petition the Local Government Board to promote a Bill in Parliament to regulate the procedure in dealing with party structures in a similar manner to the London Building Act of 1894 in all parts of England where there are no Acts of Parliament dealing with such party structures." This resolution was carried unanimously.

Mr. J. M. Brydon then moved a resolution congratulating Sir Laurence Alma Tadema, R.A., who had done yeoman service to the Institute as a member of the Art Committee, upon his knighthood. The resolution was carried with acclamation.

A Vicarage is being erected in connection with St. Matthew's Church, Edgeley, Stockport, at a cost of about £2,000.

The Glasgow Architectural Association annual business meeting was held in the Rooms, 187, Pitt Street, on Tuesday evening, June 6th, at 7.30, the president, Mr. Geo. S. Hill, A.R.I.B.A., in the chair. The business of the evening comprised the reading of the secretaries', treasurer's and librarian's reports, which were adopted, and the election of new office-bearers for the ensuing season. The following gentlemen were elected to office:—President, Mr. John Fairweather, A.R.I.B.A.; vice-presidents, Mr. Chas. E. Whitelaw and Mr. Wm. J. Blain; secretaries, Mr. Alex. Wingate and Mr. Thos. Ramsay; treasurer, Mr. Walter S. Tucker; librarian, Mr. Andrew Rolls; general committee, Messrs. Geo. S. Hill, A.R.I.B.A., Jas. Lockhead, A.R.I.B.A., Alex. McGibbon, A.R.I.B.A., Jas. McKissack, Alex. Davie, Wm. Vickers, Wm. S. Lukeman and Robert J. Walker. A vote of thanks to the retiring president, Mr. Geo. S. Hill, concluded the meeting.

### THE REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.  
CLAPHAM, S.W.

SIR,—I beg to call attention to one or two points in the Architects' Registration Bill which I think want thrashing out, and I respectfully offer a few suggestions for consideration by the framers of the Bill.

(1) I consider that no annual fees should be paid, for it would be distinctly unfair if a

where so it would come under the head of non-professional conduct. (3) Members of the Royal Institute of British Architects ought not to be shown any favouritism by the exemption from the payment of fees. (4) With regard to the apprenticeship to a practitioner, I think this is quite unnecessary if the examinations are conducted properly, so as to show the knowledge of the candidate. To ensure this examination being of a sound and practical nature, I would add to the General Council members elected by the Master Builders' Association, the Engineers' and Surveyors' societies. (5) Clause 27 should not stand as it does at present; it provides that registered architects alone should be allowed

professions who was able to show certificates of competency from the council of whichever recognised society he belonged to. (6) Registered foreign or colonial practitioners ought not to be prevented from practising in the United Kingdom, for this would mean that were a large and very important building of world-wide interest to be erected in this country, and were the selection of the architect for the work a matter for open competition, as in the case of the building of the University of California, competed for just recently, the choice would be restricted to architects at home. I would propose that a foreign or colonial practitioner, registered as such, should be allowed to carry out work here provided he personally superintends the work. And, again, the Isle of Man and the Channel Islands are proposed for classification as colonies. Surely these are near enough for an architect to safely see to the carrying out of work in Great Britain. (7) I think that the register should also be made out under the towns in which the registered persons practice, and not only in alphabetical order, for it would often be necessary to know the disposition of practitioners in any locality.

But for these restrictions I consider the Bill is extremely sensible, and would undoubtedly obtain for the profession that much-needed recognition by the public, and would help to promote a better architecture.—Yours, &c.,

H. D.

## Views and Reviews.

### LONDON'S WATER SUPPLY.

This book provides a comprehensive digest of the facts bearing upon the present controversy upon the water supply of London. Mr. Shadwell does not provide dry reading, but treats his subject in a most clear and generally satisfactory way. It is a great pity that the water question has descended into the arena of party politics, and, in truth, Mr. Shadwell does not seem to be entirely free from party bias. All the mud throwing that has taken place has wearied and disgusted the average Londoner until he has quite lost interest in the question. It will therefore be a relief to him to turn to the pages of this book and have the facts of the subject clearly placed before him. Although the author contends that the inhabitants of the metropolis are well supplied or could be, by the companies, he is not unwilling to admit the reasonableness of the public control of such necessities as water gas, &c., and to this end he makes a suggestion worthy of most careful consideration. He suggests that the water question is not simply a local one, but a national one, and should be controlled in respect to the sources of supply, and the treatment of water before delivery, and suggests amalgamation of the companies for the provision and distribution of water. Mr. Shadwell makes a strong case against the policy adopted by the London County Council in trying to secure control of the water supply to the Metropolis. With regard to the technical difficulties of the problem, he wisely leaves them alone. This side is being considered by Lord Llandaff's Commission, and we shall hear from them as to the advisability of the adoption of Sir A. Binnie's scheme for the bringing of water from Wales, and whether a large enough supply cannot be got for many years to come from the sources at present available. The question of long distance supply is also agitating the Midlands, and, therefore, Mr. Shadwell's suggestion is most opportune. He contends that the present supply of London compares most favourably with Continental towns and our own large towns, and the statistics he puts forward seem to warrant this view. We strongly advise the perusal of this work by all who are interested in the water problem.

"The London Water Supply." By Arthur Shadwell, M.A., M.B. 5s. London: Longmans, Green, and Co., 39, Paternoster Row, E.C.

The Dedication of a new Tower at St. Michael's, Aston, occurred last Thursday.

person were placed in such a position that he was unable to pay the fee within the time allowed that he should be practically deprived of the means of gaining his living in the domain of architectural practice until he had paid his fees. (2) I would omit in clause 18 the sentence relating to removal of name from register on account of misdemeanour or higher offence, for I do not consider that this would in all cases be detrimental to his standing as an architect, but

to recover fees for professional services, but that this shall not prejudice the right of professional members of the Institution of Civil Engineers or the Surveyors' Institution to recover charges for work of any kind falling within the duties of their callings. Surely there are other societies besides the two named which have a claim to the same consideration. Also 28<sup>(3)</sup> should be amended with regard to these same institutions. I would amend the clauses so as to include any member of these

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### DESIGNS FOR SMALL COTTAGES.

To the Editor of THE BUILDERS' JOURNAL.

ALLOA.

SIR,—Do you publish a book, or special number, dealing with cottage designs? I want to build a cottage of about four or five apartments, two or three rooms downstairs, two upstairs, say storey and a half, something nice, simple, and cheap, and should be glad if you can give me any assistance in the matter. —Yours, &c., F. H.

An article on "The Planning of Small Houses," by Mr. H. V. Lanchester, A.R.I.B.A., appeared in our issues for February 10th and 17th, March 10th, April 21st, May 19th, and June 23rd, 1897. Small designs that probably meet your requirements appear in our issues for September 2nd and November 11th, 1896, and for March 30th, 1898. Designs for larger houses are constantly appearing in our columns.

### CONSTRUCTING TILED ROOF.

To the Editor of THE BUILDERS' JOURNAL.

RUGBY.

DEAR SIR,—I am constructing a roof over a house, without wood, tiling with plain Broseley tiles on steel laths. I propose to hang ribbed tiles with clean laths, not tiles, and torch in Portland cement mortar (2 and 1). Can you tell me (1) Whether any special treatment or precaution is necessary to insure the cement gripping the lath? (2) Whether the cement should be used in a larger proportion to the sand, or may be used in a less?—Yours gratefully, P. F. X.

We cannot remember ever having seen this construction attempted before, so that whatever is done will be experimental; but we fancy (1) That a key for the mortar would have to be provided, by punching rough holes through the laths or by indenting their edges; and (2) That hair should be mixed with the mortar, the proportions of which should otherwise be satisfactory. G. A. T. M.

### THE OLD "BLUE-COAT SCHOOL," AT WESTMINSTER.

To the Editor of THE BUILDERS' JOURNAL.

CATFORD, KENT.

SIR,—Would you kindly tell me what is going to be done to the old "Blue-coat School" in St. James' Street, Victoria Street, S.W., which is, I believe, ascribed to Sir Christopher Wren. It looks as if it were about to be pulled down. If so, can you tell me if measurements of it exist and where they are?—Yours faithfully, W. H. G.

We are informed by the Clerk to the Vestry of Westminster that the property has been purchased by the Vestry for conveyance to the Trustees of the National Schools of the Parish of Christ Church, in exchange for the site of the existing parish schools. One of the conditions of the conveyance is that the original building, erected in 1708-9, shall be preserved in perpetuity for the purpose for which it was erected. The ascription of the building to Sir Christopher Wren has several times been questioned, but some of the architectural features, both in the brickwork and internal woodwork, are admitted to be above the average. We know of no measurements.

### WATER SUPPLY AND DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

NORTHAMPTON.

SIR,—Will you advise me how to remedy the present arrangement of the water supply to a country house, and also as to whether the drainage is satisfactory? There is not

sufficient flush in the w.c., which is a pedestal closet named the "Shark," to clear away paper, although the excreta goes away all right. The water is pumped by a lift and force pump from a well under the scullery into a tank in roof, this supplying sink, bath, lavatory, and w.c. The cistern (two gallons) is only about 4ft. 6in. above w.c. seat, with 1½in. flush pipe.—Yours, &c., SAXON.

It is not stated whether the flushing cistern to the w.c. is of the valve or syphonic action type. The fact that the water-flush does not thoroughly clear the basin is apparently due in this case to the small head of water available, and the insufficient velocity and volume of water discharged. A three-gallon syphonic action flushing cistern, with a 2in. diameter flushing pipe, should prove an effectual remedy. The flushing pipe should be fixed with easy bends. The plan you send shows the house drainage cut off from the public sewer by means of an intercepting chamber, with syphon trap. It is assumed that the "vent" to the intercepting chamber refers to the "fresh air inlet," and that it is properly arranged on the house drain side of the trap, so as to admit fresh air to the house drains. A ventilating pipe should be provided to the outdoor closet as well as to the indoor closet. It would be an improvement if the drain from the outdoor closet were carried in a straight line to the intercepting chamber, and the branch from the indoor closet connected thereto within an inspection chamber constructed for this purpose. All bends and junctions would then be accessible. The branch soil drain under the passage inside the house, and as far as the new inspection chamber, should be of heavy cast iron, with caulked lead joints, a cast iron duck's foot bend (bedded on concrete) being fixed to receive the soil pipe. T. E. C.

### SEDILIA, &c., IN LINCOLNSHIRE AND YORKSHIRE CHURCHES.

To the Editor of THE BUILDERS' JOURNAL.

NEWCASTLE-ON-TYNE.

SIR,—I shall be glad if any of your correspondents can tell me of a church about Yorkshire or Lincolnshire that contains either a good and fairly elaborate decorated sedilia, Easter sepulchre, or monument of about the same size. I know of Heckington and Newark.—Yours, &c., HAWKEYE.

(1) I do not know of an Easter sepulchre of any pretension in Yorkshire. There is a very good sedilia and piscina in the choir of Selby Abbey, with one or two good screens. In Beverley Minster is the celebrated Percy shrine, one of the most beautiful monuments in Great Britain. Also there are some very good tombs in York Cathedral, especially the one to Archbishop Walter Grey. But for beauty of proportion and good design it would be hard to beat the tomb to Lord Lionel Welles in Methby Church, near Leeds. If your correspondent would write to me, I should be very pleased to give him whatever information about architectural Yorkshire I know. HAROLD E. HENDERSON.

12, Ridge Road, Armley, Leeds.

(2) I know of nothing in Yorkshire or Lincolnshire to touch Heckington for its Easter sepulchre and sedilia, or for any monument of that size and of equal richness of the decorated period. There is a beautiful sedilia in Ripon Cathedral, and a fine Easter sepulchre at Lincoln; also a beautiful altar screen at Selby. Of course "Hawkeye" knows of Beverley and its beautiful altar screen (back part unrestored) and Percy tomb. There is a fine founder's tomb and chantry in Trinity Church, Hull, but much restored. At Helpringham, close to Heckington, there are also interesting sedilia, piscina, &c., of decorated date. J. J. C.

A New Wing has been added to Centre Cliff Hotel, Southwold, comprising a dining hall 52ft. long and 32ft. wide, and about thirty new bedrooms over it. The architects were Messrs. George J. and F. W. Skipper, of Norwich; general contractor, Mr. J. Youngs, of Norwich; and plasterer, Mr. Crotch.

## ACCOUNTS FOR ARCHITECTS.

By HENRY CALDER MARSHALL, F.C.A.

(Continued from page 279, No. CCXXVII.)

LET us now turn to the second part of our subject, "a simple system of accounts suitable for the profession of architects," but before doing so I would very briefly say a little on the rudimentary principles of book-keeping. I hope my readers will not think I am insulting them by beginning with "first steps" any more than I should feel insulted if they volunteered to teach me the A B C of Architecture.

What is book-keeping? We will not answer the question by replying, "The art of keeping books;" that reminds us too much of the student, who, when going up for an examination, was asked the question, "What is an Archdeacon?" gave as a reply, "One who performs Archidiaconal duties." Perfectly true, no doubt, but not such an answer as would convey to the examiners the feeling that the candidate knew anything of the subject.

Book-keeping may be defined as the art, science, or method of recording the financial transactions of a business or person so as to show at a glance, at all times, the value of the whole estate or capital, and of each of its component parts in a clear and concise manner.

It shows whether capital has been increased or diminished, and by what means such gain or loss has been effected, and also the state of the account between the professional or business man and the person or persons with whom he has transactions.

The component parts of an architect's business may be summed up, I think, as follows:—Cash (either at bank or in hand), fees (commission or otherwise), perhaps bills and debtors, lease, furniture, &c. These, after deducting creditors and other liabilities, form the capital or estate—and I will try to show how these can be exhibited in a way that shall be, at one and the same time, both comprehensive and concise.

There are two systems of book-keeping, one named "Single Entry" and the other "Double Entry." We will leave the first or "Single Entry" alone altogether as being incomplete and unsatisfactory, and only deal with the system called "Double Entry." But do not run away with the idea that "Double Entry" means double work. It does certainly entail a little extra work, but this is far more than compensated for by the "Double Entry" being both correct and in every way more satisfactory.

There are two sayings or axioms in connection with book-keeping by "Double Entry" which cannot, I think, be too strongly reiterated, these are "Every debit requires a credit" (and consequently "Every credit requires a debit") and "In debit out credit." The first is the foundation of the system, and the second is a short and trite way of explaining that a man should debit himself with all he receives and credit himself with all he gives out.

The page to your left hand in a ledger is called the debit side, and that on the right the credit side, and it must not be forgotten that every entry on the one side must have a corresponding entry on the other side, either in a single amount or in an amount made up of the several items. The totals of all the entries on the debit side should agree with the totals of all the entries on the credit side.

In one of our ablest works on book-keeping, the writer says:—"Book-keeping creates nothing, it merely records transactions as between a giver and a receiver, the giver (as an individual or an aggregate) being credited with what he gives, while at the same time the receiver (as an individual or an aggregate) is debited with what he receives, and thus the balance is always kept equal" (Gérard van de Lindes' Book-keeping, page 2). And so we come, back to our quotation, "In debit out credit." Let me give you an example. Our architect renders a bill of costs—what goes out and what comes in. The architect has given out his services, therefore the amount at which he values his work is placed to the

credit of fee account, and the client to whom the bill is sent becomes the debtor, so we debit his account with the amount. Now what happens when the account is paid? The money comes in to cash, therefore cash is debited, it goes out of the client's account, therefore the client is credited with the amount.

Again; you buy some goods: what comes in? The goods. Therefore you debit goods or purchases account. What goes out? Why your indebtedness to the seller of the goods; therefore you credit his account with the amount. When you pay for the goods what happens? You take the money out of your bank; therefore you credit cash and you put it to the seller's account, therefore you debit him.

Take the case of bills receivable. A man owes you money; he is debtor in your books for the amount. He gives you a bill, at say one month; that bill is a bill receivable. You say he has given me the bill in discharge of the debt, and until the bill becomes due he is no longer my debtor, therefore you credit his account with the amount, and as every credit must have a debit, you debit, what? bills receivable, for it is this account that now owes you the money. When the bill is paid, you debit cash and credit bills receivable.

Take the converse, you owe money and give a bill at say one month. This bill is a bill payable. The client to whom you gave the bill was a creditor in your books, but directly you give the bill he ceases to be a creditor until the bill becomes due. So you debit his account and credit bills payable, and when you pay the bill you debit bills payable and credit cash. Bear in mind that there is always a *raison d'être* in all these entries.

You will, no doubt, remember the story of the Irishman who gave a bill at a month for an amount he owed, and exclaimed, "Thank goodness, that account is settled." He was right in a book-keeping sense and to a certain extent, for of course during the month he no longer owed his creditor, he owed bills payable, but at the end of the time when the bill became due he would find out, not only in a book-keeping sense, but in a very practical and perhaps forcible manner, that he still owed the money.

Leaving the matter of book-keeping in the abstract, for the time being, we will turn our attention to what I would consider a satisfactory system for an architect's office, and in doing so, will you kindly imagine that I have been called in by a firm of architects (who up to this time have only had a letter-book and bank pass-book) to arrange a scheme of book-keeping for use in their office. They wish me to provide for all contingencies, and to frame for them a very complete system. They are not frightened at detail, being accustomed to that in the work of their own profession. I can find no book dealing with this special work on the shelves of our library, so I and my partners put our heads together to do the best we can for our clients, keeping the work as simple as possible and remembering that we shall have to audit the accounts at the close of the year.

We have already been in and analysed the pass-book and have gone through their letter-book, and have been able, with the aid of various vouchers, invoices, &c., to draw up a statement of assets and liabilities to form the basis of the new system.

There are four important matters that I have taken into consideration in arranging the books:—

1. Book-keeping as between the work or commission and the client.
2. Book-keeping as between the work or commission and the architect.
3. Book-keeping as between the client and the architect.
4. Book-keeping as between the architect and his partners, or the internal work of the architect's office.

I will now give you a list of books, and I hope you will not be staggered at the number. I do not say that they are all absolutely necessary, but, as you will remember, I was called in to prepare a scheme for a very complete system.

**SPECIAL BOOKS.**—1, Instructions Book; 2, Register of Plans and Drawings; 3, Specifications, Estimates, and Sub-contract Book; 4, Certificate Book; 5, Contract Book.

**FINANCIAL BOOKS.**—1, Commissions Book; 2, Cash Book; 3, Petty Cash Book; 4, Journal; 5, Ledger—Clients; 6, Ledger—Private.

**SUBSIDIARY BOOKS.**—1, Register of Letters Inwards; 2, Postage Book; 3, Press-Copy Account Book; 4, Press-Copy Letter Book; 5, Wages Book.

Before entering upon particulars of each of these books, I would ask you to bear in mind the following fundamental rules, which the firm of architects, at my suggestion, willingly acceded to:—

1. Every commission work or job to bear a distinctive name or number, corresponding to the number given to it in the instructions book.
2. Every penny of cash received in the business to be paid into the bank and not used for petty cash purposes.
3. All books to be closely written up—say, daily. This is most important in the case of

plans and meeting surveyor and builder—&c., &c.

This book is, as it were, a complete history of each commission, the closing entry being, account sent in such and such a date, the want of such an entry showing that the commission is still open, and that it has not come into the financial books.

The Instructions Book should be under the continuous inspection of the principal, and I would also advise that the architect have small memorandum books, one for each job, for facility in carrying about; in these would be jotted down roughly, notes, &c., for transcription into the Instructions Book.

**REGISTER OF DRAWINGS.**—This is a very useful book, as by its aid the working drawings of any building can readily be referred to without the necessity of turning over a pile of plans. A place for every drawing, and every drawing in its place, would be a good motto for an architect's office. A column is given in which to note the date and number of copies supplied to builder, as if more than one drawing is required an extra charge may be made.

REGISTER OF DRAWINGS.

No.	Date.	Name of Job.	Description.	No. of Drawing.	Date sent out.	Date returned.	Remarks.

books of initial entry, such as instruction book, &c., &c.

4. No account or letter to go out of the office without being press-copied in the book provided for that purpose.

5. No payment to be made out of petty cash without having a voucher for the same.

6. All vouchers both for cash payments and petty cash payments to be filed in numerical order.

7. No posting allowed from one ledger account to another, except through the journal.

**INSTRUCTIONS BOOK.**—A plainly ruled foolscap book is all that is necessary. It should have an index so that any entry can be easily referred to. In this book are entered up under a distinctive number all the particulars of each work or commission that comes into the office, with rough sketches, notes, &c., from the clients' instructions. It is not necessary to restrict each entry to one page, as if the work

**SPECIFICATION, ESTIMATE, AND SUB-CONTRACT BOOK.**—An ordinary guard book (with an index) for gumming in the various specification and quantity sheets which form the basis on which the estimates are prepared and contracts fixed; also for estimates and contracts themselves. If closely kept up and indexed this book will be found most valuable.

**CERTIFICATE BOOK.**—This is a counterfoil book containing the usual certificates, with builders' receipt form on the back. On the counterfoil should be noted the distinctive number of the commission, with details, showing amount of contract, amount certified, and balance.

CONTRACT BOOK.

Contract No.  
Name.  
Description of Building.

Contract Date.

Accepted Tender.	Name of Contractor.	Certified Instalment.			Commission.		Remarks.
		Date.	No.	Amount.	Rate.	Amount.	

is considerable the particulars would occupy more space, thus the particulars of building a church or town hall would occupy more space than those pertaining to alterations in a private house.

EXAMPLE OF ENTRY.—No. 1.

CHURCH OF ST. ANDREW'S. Slumpton.

January 1st, 1898.—Called by request on the Rev. Robert Spalding, and received instructions to make plans and drawings for a new church, cost not to exceed £5,000; viewed the site, and made rough ground plan.

March 5th, 1898.—Submitted plans and drawings, met the committee, and arranged to make an alteration by the addition of a side chapel—and so on.

EXAMPLE.—No. 2.

W. JOHNSON. Klondyke House, Goldborough.

February 4th, 1898.—Received instructions from Mr. Johnson that he wished to construct a billiard room to Klondyke House, drawing

The Contract Book will be found useful for showing the state of the work as between the contractor and the client. It is posted up from the Instructions and Certificate Books—a page being given for each commission—it contains particulars of contract number, name, description, contractor's name, contract date, amount of accepted tender, instalments as per certificates, number, date, amount, commission. By adding the last columns it will be seen what the work has cost the client up to a given date.

(To be continued.)

**A New Chapel at Drumcondra.**—A new chapel for St. Patrick's Training College, which has been built from the designs of Mr. G. C. Ashlin, of Dublin, was opened recently. The chapel is built of red bricks with Portland stone dressings, and is 85ft. long by 28ft. broad, and 36ft. high. Mr. James Donovan, of Dublin, was the builder.

## Bricks and Mortar.

June 21st, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### Westwood Croft.

THE country house, of which a perspective view and ground plan are given in one of our inset plates, has been erected from the designs of Mr. Francis W. Bedford, A.R.I.B.A. We think our readers will agree that it forms a very pleasing example of domestic architecture. The house is all of local stone, and the roof was intended to be covered with stone slabs, but by the owner's wish red tiles were used instead. The parapet of the porch is carved with vine, grapes, birds, and butterflies; the knots under it are carved with different flowers, and on the sundial are carved wild roses and the motto "True as the Sun." All the principal rooms have oak floors and the hall is panelled to door height. Our illustration is from a pencil sketch by Mr. C. E. Mallows.

### Design for a Clock Tower.

THE design illustrated in our second plate was submitted by Mr. Henry Rose, of 3, Staple Inn, Holborn, W.C., in competition for the Lewisham Clock Tower, in commemoration of the Queen's Jubilee. The total cost of this tower was not to exceed £700. The site was in the High Street at the junction of the High Road. Mr. Rose's design was intended to be built in Portland and Red Mansfield stones. The statue was to be of cast lead, partly gilt, the door flush, faced with wrought iron studs, &c., special tiles for roof, and the wood-work painted green. The conditions of competition required the base not to exceed 8ft. square, and the design to include finger posts and ornamental lamps on the north-east and south sides at a height of not less than 12ft. from the ground. Neither iron nor brick, it was stated, would be considered suitable; stone, marble, or terra-cotta, or similar material, was to be used. The accepted design was by Mr. Arthur R. Gough.

### Southend Presbyterian Church.

THE design by Mr. John C. T. Murray, of 21, Old Queen Street, Westminster, which we illustrate in one of our centre plates, was recently submitted in a limited competition for the new church at the corner of Park Road and Park Terrace. The buildings comprise a church, seated for about 520, a hall to seat 230, vestry, session room, doreas room, and the necessary cloak room, lavatory, and scullery accommodation, and were estimated to cost about £8,700. Red brick and stone with green slate roofs were intended to be used throughout for the main buildings, tower and spire,

the floors were to be of solid wood blocks on concrete, the heating being by hot water supplied from chamber in the basement. The plan consists of nave and aisles with angle tower. The architectural treatment is Late English Gothic.

### The Reform of the Academy.

MR. W. J. LAIDLAY, writing to the "Morning Post," calls attention to the pressing need of a reform of the Royal Academy. Two Parliamentary inquiries of 1836 and 1863 have—he points out—after most careful and elaborate investigation of the facts, condemned the Academy, and have recommended reforms. The public ought to know (1) that it has been decided that the Academy needs reforming; (2) that the commissions have suggested so far back as 1863 the reforms they considered necessary; (3) that not a single reform has been adopted by the Academy, though in the Academy itself there is a considerable number of members committed to the policy of reform; and (4) that the excuse these academicians make for not carrying out the reforms they declared as outsiders to be necessary and desirable, is that though desirous of reforming the Academy they are powerless, the management being, as they assert, in the hands of the president and council. Mr. Laidley clearly forces upon one the conviction that (a) no further inquiry is needed, and (b) that the question is no longer whether the Academy needs reforming, but rather whether the Government will insist on the Academy honouring the reports of the Commissions of 1836 and 1863. A president of the Academy has stated that no outsider has made a disinterested complaint against the Academy, because the object of all the complainants was to have their work well hung. But some of the Academicians complained when they were outsiders, and now defend themselves by stating that they are powerless, as the whole power wielded by the Academy is vested in the President, Keeper, and eleven members of the Council. But as these are elected at short intervals, it is difficult to understand how the other fifty-seven members are so helplessly powerless. The allegation that because they spent some money on Burlington House and their Art Schools, which were condemned by the Commission of 1863 as "insufficient and inefficient," they may conduct the Art affairs of the nation as they choose is absurd, because the money so expended was made when they had free rooms in other Government buildings, and more than that has been derived by the exhibition—in part, at any rate—of the works of outsiders.

### Some suggested Reforms.

MR. JAMES STANLEY LITTLE writes commending Mr. Laidley's letter and suggests the following reforms: "(1) Academicians should be elected for a limited period, not necessarily annually. Possibly a term of five years might meet the case. They should not be elected from their own body, but by the suffrages of the whole body of artists. (2) The works of Academicians should be subjected to selection, and the Selecting Jury should be a body in which critics, amateurs, and connoisseurs were represented. (3) No artist, Academician, or outsider should be allowed to submit more than three works to the jury. (4) The number of pictures accepted should be reduced. The present system of hanging and cramming the pictures on the walls, so that they make a pattern much like a piece of nursery patchwork, makes it impossible for a real work of Art to assert itself, while it is obvious that it is quite impossible for any country to produce in one year upwards of a thousand pictures of sufficient value to merit inclusion in what poses as being, and ought to be, a national exhibition. (5) The snobbish pre-eminence of pictures in contradistinction to other expressions of the artistic temperament is inimical to the true interests of Art. The so-called minor, or applied arts, are of equal, if not of greater importance to the national welfare from an æsthetic, and certainly from a commercial and utilitarian point of

view, than pictures. These branches of art should be represented at Burlington House." We fully endorse this last suggested reform, which we have constantly been striving to obtain, for it is a scandal that Architecture, to which the other arts owe everything, is so ignored, and even treated with contempt. In the House of Lords, on Monday, Lord Stanley of Alderley addressed to the Government various questions on the subject of reform. We shall have something further to say next week with regard to the matter.

### The Hanging of Pictures.

IN connection with the suggested reform of the Academy, Mr. Walter Severn, of the Dudley Gallery, brings to notice the need for a more expeditious and simple method of arranging and securing the pictures on the walls. Mr. Severn has found out a plan which is used at the Dudley Gallery, where 400 pictures can be hung in two days with only one carpenter to help the hangers. The plan has also been adopted largely on the Continent. It consists in attaching small wood battens to the wall, on which the pictures hang. The upper and lower line are first arranged on two of the battens, and the pictures can be shifted and changed any number of times along these battens. The plan is most simple, and allows of such easy alteration of a picture if the position is not suitable. The Academy, with its wooden walls, would be specially suitable for this system, which would be a great improvement on the present system of fixing each picture to the wall with several plates and several screws, the alteration, if even one picture, involving the laborious unscrewing of a whole group.

### The Potter as Historian.

ON the mantelpieces of many cottage homes may be found representations in clay of subjects which the inmates admire and revere, as their ancestors did before them; but these ceramic portraits are crude, and not very high art, and mainly deal with military and naval personages. Mr. Henry Willett, of Brighton, has an idea that the history of the country may be traced in its homely pottery, and to support his somewhat fantastic theory, he has been ransacking English cottage homes for several years, and the result of his labours is being exhibited at the Bethnal Green Branch of the South Kensington Museum in the shape of 1,715 pieces of potters' work. These are not to be regarded as examples of ceramic art, but rather as carrying out Mr. Willett's idea. Conspicuous in this large collection are two busts of Josiah Wedgwood, one of which is in Parian ware after Flaxman's medallion in Stoke Church, and is some 21in. high; the other is in the form of a medallion, and measures 4½in. by 4in. There are several specimens of the work of George Tinworth in terracotta; one is a medallion portrait of himself, and another represents his father's shop. His father was a wheelwright, and the plaque shows George Tinworth busily engaged in modelling in clay, instead of attending to his father's business. There are several earthenware plaques representing the potter's art in various countries.

### Architecture in Clay.

AS might be expected, the kind of potter whose work Mr. Willett has collected, has not made very many attempts at reproducing models of buildings, and the architectural section of this collection would not form anything like a record of the architecture of the past. Whenever the potter has ventured into this department he seems to have contented himself with small models of cottages. There is on view a pastille burner in Delft ware in the form of a house, printed in blue, and inscribed "In De Rokende Moor." This is a modern Dutch work, and is about 6in. high. Other pastille burners in the shape of thatched and half-timber cottages, a lock-up, and a bungalow, have been made with a certain amount of finish. There is a gaudily coloured model of a church shown, which stands about 9in. high, and was presumably made in 1790.

The best representation of the potter's art exhibited is a coloured model of Westminster Abbey, 7in. high. There are various plates, cups and saucers, jugs, &c., with views of well-known buildings printed upon them, very much after the style of the china presents bought at watering places.

### Preserving Natural Beauties.

WE are glad to see that the Richmond Town Council are not indifferent to the natural beauties of their beautiful town. The Office of Woods and Forests have proposed to fill in the little stream known as the Ha-Ha, which flows between the Old Deer Park and the Thames sidewalk at Richmond. What particular advantage is expected to be gained thereby does not appear. The town council very properly objected, and at their meeting last week they unanimously agreed that the proposal, if carried out, would mean the destruction of one of the most beautiful scenic features in Richmond; they accordingly appointed a deputation to place their views before the authorities of the Office of Woods and Forests who have charge of the stream.

### Glass Makers and their Work.

WE noticed a few weeks ago, giving it no more than its due, a thoroughly capable, as well as enjoyable, book on the "Romance of Glass Making," and having had occasion to refer to the chapter devoted to Venice we find our first impressions confirmed, and would advise everyone who wishes to know just as much as he need about glass to give it a place on his shelves. If it were likely to have the evil effect of making him an indiscriminate collector of things merely curious, we should not recommend it so heartily; but quite the reverse is the fact, for, judged by the things they display, there are really deplorable exhibits at the British Museum, and at South Kensington, beyond doubt, a vast number. Probably most people have noticed that the quarrel with the glass-factor generally begins at the points of juncture between the part that is blown and the part or parts that must be attached to it; as, for instance, between the bowl and the handles. Out of many one sees it would be difficult to select more than a few in which this joining of parts has been effected quite satisfactorily.

### British Archaeological Association.

THE concluding meeting of the session was held at 32, Sackville Street, on June 7th. Mr. Thomas Blaskill, hon. treasurer, in the chair.—Mr. Hornblower exhibited a fine Roman cameo dug up in Worship Street at a depth of 18ft., also some Flemish and other pottery found in Curtain Road, Shoreditch, at a depth of 8ft., in excavating for foundations of a new factory.—Mrs. Day exhibited an original description of the "First aerial voyage in England," by Vincent Lemardi, in 1784.—Mrs. Pears contributed some notes upon a curious discovery recently made on the Scarisbrick Estate in Martin Mere, between Southport and Rufford. This consisted of a canoe or "dug-out." The canoe is 16ft. 6in. over all, the greatest breadth being 4ft., the inside width 3ft. 9in.; it is made out of the trunk of an oak tree. The wood having warped at the stern, a boomerang-shaped piece of wood has been used to hold it together with wooden pegs. This remedy apparently failed, and a sheet of lead about the thickness of a sixpence was placed over the warp and attached with pegs or nails, which from the analysis of the dust from the pegholes appear to have been of iron. The vessel was discovered whilst ploughing, and the obstacle to the plough was thought at first to have been a stump, but on carefully digging away the soil the canoe was unearthed. It was lying slightly on one side and tilted upwards. The position in which it was found was about 200 yards from the old bank of the lake.—Mrs. Collier read a paper, "On the Châteaux and Domestic Dwellings of France in Mediæval Times," which was profusely illustrated by drawings, photographs, and engravings.—A paper, "On Ancient Customs," by Mr. Andrew Oliver, was read by the author; and a short paper contributed by Dr. Russell

Forbes in continuation of his account of the Discoveries in the Forum at Rome was read by Mr. Patrick, hon. secretary.

### Fire Tests.

THE Testing Station of the British Fire Prevention Committee was again the scene of an important series of investigations last Thursday, which were attended by Sir John Taylor, K.C.B. (H.M. Office of Works), and Mr. Alexander Siemens on behalf of the Council, Mr. H. H. Statham, for the Members' Testing Sub-Committee, Mr. Edwin O. Sachs (chairman), and the members of the executive. The strictly limited number of visitors was this time chiefly representative of the London County Council, Mr. Waterlow and Mr. Yates, chairmen of the Building Act and the Theatres Committees, attending with Mr. Riley, the architect, with several officials from his department, Lieut. Sladen, of the Metropolitan Fire Brigade and a number of district surveyors. The leading Government departments, with some of the great insurance offices, were again represented. The tests comprised:—(1) A two and a half hours test with a concrete floor, by the Columbian Fire-proofing Company, U.S.A., being the severest test so far applied by the committee to any floor. (2) A half hour test with a skylight of Prisms by the British Luxfer Prism Syndicate. (3) A three-quarter of an hour test with plain electro-glazed casements by the same makers. (4) An hour (comparative) test with an iron door, and an armoured wood door. The reports describing the tests will be issued by the executive in due course.

### Threatened Vandalism at Croydon.

CROYDON is at present very much interested in the question of removing the old Whitgift Hospital. It is rumoured that this piece of vandalism is to be carried out in order to make way for the widening of George Street. The building, which is of great historical interest in the town, stands at the junction of four of the most important roads, and it has been suggested that the needs of traffic would be served quite as well, if not better, by constructing a new road behind the almshouse buildings, leading from George Street into North End. The original building of the hospital is a quadrangular erection of brick and stone in Elizabethan style, and it was renovated some years ago. The charity was founded in Queen Elizabeth's time by Archbishop Whitgift. The men almoners, who are selected by the Archbishop of Canterbury, receive £40 a year, and the women £30, together with medical and nursing attendance, gas and partial firing. According to the constitution of the hospital, the almoners must be chosen either from the household of the archbishop, the Croydon or Lambeth parishes, or from the parishes in Kent whose benefices are annexed to the See of Canterbury. It is to be hoped that previous to destroying such an interesting and historical building, all possible alternatives will be carefully considered.

### An Unfounded Rumour.

LAST week we warned our readers against attaching undue weight to the rumour that "more scandals" were to be revealed in connection with the Works Department of the London Council. According to the "Daily Chronicle" of last Friday the facts of the case are as follows:—"There was an adverse balance of £55,000 against the department, but under the present management this has been reduced to £45,000, in addition to which there is a balance on jobbing works of £8,000 in favour of the department. The two instances on which the authors of the rumours rely have been known to the Council for some time, although the certified figures have only just been presented. The story has its foundation in anticipation of figures being presented to the Council showing on works commenced under the late management to the amount of £50,000 a loss of nearly £5,000, whilst, on the other hand, upon works commenced under the present management to the tune of £12,500 there is a saving of £555."

### A Cretan Exploration Fund.

MESSRS. ARTHUR J. EVANS and George Hogarth announce that a Cretan Exploration Fund is being formed under their direction, and in co-operation with the British School at Athens, in order to carry out a series of comprehensive excavations. His Royal Highness Prince George of Greece, High Commissioner of the Powers in Crete, has consented to become patron of the fund. By his support sites for excavation have been secured at Knosos, which was the city of Minos and the traditional centre of the ancient sea power of Crete, at Prasos, where it is hoped to discover the chief stronghold of the original Eteocretan race, and at Lyttos, regarded as the model Dorian city. The Cave of Psychro, on Mount Dikta, is also included in the present plan; and the investigation of some prehistoric sites on the South-east Coast of Crete promises to throw a valuable light on the early intercourse with Egypt. For these explorations £5,000 at least are required. It is intended to enrich the National Cretan Museum, adapted from the old Venetian Armoury at Candia, with the chief results of the excavation. Mr. George Macmillan is the treasurer to the fund, and subscriptions may be paid to him at St. Martin's Street, or into the account of "The Cretan Exploration Fund," at Messrs. Roberts, Lubbock and Co., Lombard Street, E.C.

A GENERAL MEETING of the Killarney National Trust for Places of Historic Interest or Natural Beauty will be held to-morrow afternoon at 4.30 p.m. at Grosvenor House, by kind permission of the Duke of Westminster, the president, to consider the proposal to acquire the Muckross Estate, Killarney, as a public park and international tourist resort, after the manner of the Yellowstone Park in the United States. This action has been caused by the rumour that the estate was likely to be sold to a commercial undertaking, to the detriment of this beautiful and world-renowned spot.

### Mr. Watts' Gallery of Heroes.

DR. TRISTRAM, Chancellor of the Diocese of London, delivered judgment last Friday in reference to the application for a faculty to carry out certain alterations at the Church of St. Botolph, Aldersgate. He explained that it would be to the interest of the parish to have his decision at once on the part of the faculty relating to the proposed covered way. It will be remembered that the vicar, the Rev. Henry Reginald Gamble, and the churchwardens of the parish applied for the faculty authorising them to make certain improvements in the churchyard as well as in the church. A faculty was granted some years ago, under which the churchyard was laid out as a garden open to the public. Additional ground has since been added at a cost of £6,000, provided by public subscription. To this sum the Kyrle Society and the Metropolitan Public Gardens Association contributed more than a third. A wall will have to be erected separating the churchyard from the street, and Mr. G. F. Watts, R.A., has generously offered to decorate this wall with frescoes delineating acts of heroism in humble life. For the purpose of protecting the paintings from exposure to the atmosphere, he proposes to construct, at his own cost, a covered way, giving free access from the churchyard and grounds. For this covered way the faculty is sought. Dr. Tristram explained that the court was of the opinion that by the construction of the covered way the whole of the churchyard would still remain as an open space for the exercise and recreation of the inhabitants, and the Court therefore authorised the proposed construction. The solicitors for the Public Gardens Association and for the Kyrle Society formally gave notice of their right to appeal. To the remainder of the faculty a decision has not yet been given; this latter portion deals with an even more interesting point, namely, the suitability or otherwise of the panels painted by Mr. W. Sigismund Goetze, and offered by him as a gift to the church.

## LONDON COUNTY COUNCIL DOINGS.

THE members of the Council for the administrative County of London reassembled on Tuesday last week, after the Whitsuntide recess, at the County Hall, Spring Gardens, the chairman, Lord Welby, presiding. Among the several subjects dealt with was the

### Holborn to Strand Improvement.

The Improvements Committee recommended that a portion of the site of Reid's Brewery, bounded by Clerkenwell Road, Gray's Inn Road, Portpool Lane, and Leather Lane, should be acquired for £200,000 under Part III. of the Housing of the Working Classes Act, and that application should be made to Parliament in the session of 1900 to enable the Council to acquire compulsorily other lands adjoining this site. It is proposed to rehouse on the complete site 3000 persons of those who will be displaced by the Holborn to the Strand and Clare Market improvement schemes. The rest of the people to be displaced will be accommodated on the Millbank site.—Mr. Beachcroft moved as an amendment that the following words should be added to the recommendation:—"And that the Parliamentary Committee be instructed to take steps with a view to the Council being given powers to sell or let land acquired under Part III. of the Housing of the Working Classes Act." It was contended that this was a matter which should first be considered by the Housing Committee, and the amendment was, on a division, rejected by sixty-six votes to thirty-eight. The recommendation of the committee was adopted. It was stated that a

### Chief Assistant Architect

was required, and, on the recommendation of the Establishment Committee, it was agreed to issue advertisements inviting applications for the appointment at a salary of £800 a year.—On the motion of Mr. Baker, the following resolution concerning

### Underground Tramways,

was adopted:—"That it be referred to the Highways Committee to investigate and report to the Council as to the practicability of constructing a shallow underground electric tramway from Westminster (via Parliament Street, Strand, Fleet Street and Cheapside) to the Bank, thence under Moorgate Street to the terminus of the North Metropolitan Tramways Company at Finsbury Pavement, on a similar principle to those laid under Andrassy Strasse, Budapest, and in Boston, U.S.A., provision being made beside the tram lines for suitable subways to contain gas and water mains, electric light mains, telephone wires, &c."

### An Art and History Committee,

The following motion was proposed by Mr. Granville-Smith, and carried by a small majority:—"That it be referred to the General Purposes Committee to consider and report as to the desirability of appointing a new Standing Committee, to be called the "Art and History Committee," to which all questions of an artistic, archaeological, or historical character should be referred, so that the artistic claims or needs of the streets, buildings, monuments, antiquities, statues, and works of art of the Metropolis may be fully considered."

### Miscellaneous.

It was agreed, on the recommendation of the Finance Committee, to lend the St. Giles District Board £5,000 for the purchase of offices, stoneyard, &c.; the Wandsworth District Board £10,000 for a contribution towards the provision of open space, and £1,000 for wood paving works; the Clerkenwell Vestry £2,677 for wood and granite paving works; the Battersea Vestry £30,000 for the purchase of two wharves, and £12,555 for wood paving works; the Holborn Guardians £5,000 for draining works at the infirmary; and the London School Board £150,000 for new schools. In connection with the Rotherhithe Tunnel rehousing question, the Bridges Com-

mittee recommended, and it was agreed, that the estimate of £4,900 submitted by the Finance Committee for the purchase of certain land in connection with the rehousing of persons of the working classes who will be displaced by the carrying out of the Rotherhithe Tunnel scheme, be approved, and that they be authorised to purchase the land in question, in accordance with the powers given by Part III. of the Housing of the Working Classes Act, 1890. The plans of proposed new theatres at Whitechapel and Finsbury Park were approved. The Water Committee presented a long report on the water supply of the metropolis, and on their recommendation it was agreed:—"That the Standing Orders be suspended so far as they would affect proposals for legislation in the session of 1900, dealing with the Metropolitan Water Supply, and that the Water Committee be authorised, if they deem it advisable, notwithstanding the Standing Orders, to recommend application to Parliament on this subject at any time not later than November 14, 1899."

## Keystones.

**The New Presbyterian College at Cambridge** is to cost £28,000, and will be opened on October 17th next.

**The Leeds Shambles** are to be demolished, after having long disfigured the principal thoroughfare of Leeds.

**A new Auction Mart** which has been erected at Maud, at a cost of nearly £2,000, was opened last Thursday.

**Corporation Dwellings for Glasgow Workmen** are to be erected at Haghill, the tenders for which amount to £14,399.

**A Stained Glass Window** has been erected in Spring Congregational Church, Grimsby, in memory of the late Mr. John Winttingham.

**A Permanent Lighthouse** is to be constructed on the River St. Lawrence, Canada, in place of the floating lightships, formerly used as aids to navigation.

**A New Masonic Lodge** for the convenience of professors of the arts of sculpture and painting was consecrated last week at the Freemason's Hall, London, W.C.

**Two Stained-glass Windows** have just been placed in St. Matthew's Church, Newcastle-on-Tyne, which are the work of Mr. C. J. Baguley, of Newcastle-on-Tyne.

**New Church for Balsall Heath.**—The foundation stone of St. Barnabas Church, Ladypool Road, Balsall Heath, was laid last Wednesday afternoon by Lady Holder.

**The Electrical Engineers' Conference** took place last Thursday evening at the Natural History Museum, South Kensington. Over 2000 guests were present.

**The Corner Stone** of the temporary church and mission buildings of the new district of St. Alban's, Stamford Hill, was laid by the Bishop of Islington last Saturday afternoon.

**A Darwin Statue**, which is an excellent likeness, by Mr. Hope Pinker, was unveiled at the Oxford University Museum last Wednesday afternoon by Mr. Edward B. Poulton, M.A.

**A New Section of the Isle of Man Electric Tramway** was opened last Saturday morning. It extends from Douglas to Ramsey. The line is double throughout, and is on the overhead system.

**New Sunday Schools** are being erected at Boston, Linc., in connection with the Zion Chapel, by Mr. Bradley, of Langrick, from plans by Mr. Talbot, of Batley. The cost will be about £400.

**The Sheffield Society of Architects and Surveyors**, in accordance with a practice that has existed for several years, obtained for exhibition purposes the prize drawings in the annual examinations of the Royal Institute of British Architects. These were shown in the large committee room of the Montgomery Hall last week.

**A New Primitive Methodist Church and Schools** are being erected at Stapleford, Notts, at a cost of over £1,600. Mr. T. Harper, of Hyson Green, is the architect, and Mr. C. Moul, of Stapleford, the contractor.

**Loughborough Parish Church Bells.**—Messrs. J. Taylor and Co., bell founders, of Loughborough, have recently recast, at their own expense—stated at about £500—the fine peal of bells at All Saints Parish Church.

**New Disinfectant Station at Bury.**—At a meeting of the Bury St. Edmunds Town Council last week a tender for the erection of a disinfectant station at the Isolation Hospital, at an estimated cost of £184 10s., was accepted.

**A New Chapel and Schools** are to be erected at Barnsley from plans by Messrs. Senior and Clegg, at a cost of about £4,000. The buildings are to be in Pitt Street West. The foundation-stone was laid on the 15th inst.

**An Episcopal Church and Hall** are to be erected at Tayport, the first-named to seat 200, and the second 130. The walls are to be of dark-red brick, while the roofs will be covered with green slates. Mr. T. Martin Cappon is the architect.

**Extension of City Goods Station.**—The London and North-Western Railway Company will shortly open an extension of their goods station at Broad Street. The new warehouse consists of six floors, with a superficial area of 135,000 square feet. The storage floors have been erected in sections, so that each can be completely isolated from the other portions of the building.

**Towards a New Church, School, and Parsonage** at Chorlton-cum-Hardy the Earl of Egerton has given £1,000 and a valuable site. Plans have been prepared for the new church, which is to be dedicated to St. Werburgh, and when the sanction of the Ecclesiastical Commissioners has been obtained the building of the chancel will be commenced, Lord Egerton having lent the congregation an iron church for temporary use as a nave.

**A Memorial Tablet to Lieut.-Colonel Cairncross**, which is being executed by Messrs. D. Carnegie and Son, sculptors, of Ladywell Place, Dundee, is to be erected in St. Paul's Episcopal Church. The tablet consists of a brass plate mounted on a white polished Sicilian marble slab. The brass is 3ft. 4in. high by 2ft. 3in. broad, and the inscription is encircled by an engraving of Gothic design. The marble slab on which the tablet is to be placed is 4ft. 4in. high and 3ft. broad.

**A Memorial Window in the Duke of York's School**, erected by old boys and friends of the school in memory of former pupils who have either been killed in battle or who have died on active service, was unveiled by the Duke of Cambridge on the 18th inst. The window was designed by Mr. Charles Kemp, and in the centre is a picture of the Crucifixion, with the Virgin and Child underneath. On the right and left of the window are the figures of St. Michael and St. George.

**New Buildings at St. John's Hospital, Lewisham.**—The foundation stones of new buildings for the Nursing Sisters of St. John the Divine were laid last Wednesday. The buildings will provide accommodation for the reception of thirty-three additional patients, and will be of red brick with Monk's Park stone dressings and tiled roofs. The architects are Messrs. Barnes - Williams, Ford, and Griffin, and the contract has been let to Mr. H. L. Holloway at £5,370.

**Cumberland and Westmoreland Antiquarian and Archaeological Society.**—The first meeting of this society for this year will be held on Thursday and Friday, June 29th and 30th, at the Keswick Hotel, Keswick. On the 29th inst. the members will proceed to the Stone Circle, 1½ miles distant from Keswick Station, and from thence to St. Kentigern's, Crosthwaite. In the evening there will be a meeting for the transaction of business, election of members, &c. On the 30th inst. visits will be paid to Orthwaite Hall and Camp, Whitefield Cottage, Snittlegath, Caermote, and Peel Wyke, and the party will disperse at Bassenthwaite Station.

## Professional Practice.

**Birkenhead.**—The opening of a new high altar and reredos was performed at the Church of Our Lady recently. The new high altar is executed chiefly in Caen stone, and is approached by steps of Walplaque marble. The altar-stone is supported on four columns of Labrador granite, between which are carved panels containing emblems of the Blessed Sacrament. The super-altars are of marble. The tabernacle, which has beautifully engraved and jewelled doors, and the throne, are surmounted by a great pinnacled and crocketed canopy rising to a height of 30ft. The reredos, which is placed against the three walls of the apse, is divided into two parts, the lower forming a dado to set off the altar in front and containing on each side an ambry and a piscina, whilst the angels are accentuated by carved shafts carried up into the second and higher part of the reredos, and supporting niches which contain stone images of the four evangelists. The whole of the work has been designed by the architects of the church, Messrs. Pugin and Pugin, of London, and Paradise Street, Liverpool. The structural work has been carried out by Mr. Fogarty, of Old Swan, Liverpool, the new altar, by Messrs. Boulton and Sons, of Cheltenham, whilst the painted panels—three of which only have been done—are from the studios of Messrs. Hardman and Co., Birmingham.

**Birmingham.**—The foundation stone of the new church of St. Barnabas, in Ladypool Road, was laid last Wednesday by Lady Holder. The plans, prepared by Mr. T. Frederick Proud, the architect, provide at present only for the erection of a chancel, with organ-chamber and vestries, but when complete the church will consist of a wide nave, aisles, transepts, and morning chapel. The chancel will be 24ft wide, with apsidal end, the morning chapel and organ-chamber being separated by richly-moulded arches. At the corner of Ladypool and Clifton Roads a tower will be erected, under which is the main entrance. A projecting octagonal baptistry adjoins, and above rises the end of the nave with a group of lofty traceried windows. The south side shows a range of traceried clerestory windows and bold buttresses. The style is late Perpendicular, and the whole building both inside and outside will be constructed of red brick, with moulded terra-cotta arches and tracery, and covered by a bold open timber roof and

green slates. The church will hold 900 people, and the cost, exclusive of the tower, will be £6,000. The builders are Messrs. E. Giles and Son, of Camp Hill.

**Sheffield.**—The Sheffield Athenæum in George Street is to be erected on the site of the old building, which is now in course of demolition. The new building will have a frontage to George Street of 125ft. The building will be of brick with stone dressings, and mullion and casement windows. The entrance will be in the centre of the façade. There is to be an outer porch 9ft. square, with porters' offices on either side, leading into an inner hall, 15ft. wide, with staircase beyond and a handsome staircase window. To the right will be a large reading-room and morning-room, and to the left there will be ladies' reading and dining-rooms. A corridor will run to the right of the entrance hall to a waiting-room, a library, and a committee or private dining-room. The left corridor will lead to the lavatories, &c. On the first floor there will be a suite of apartments. The staircase will open into a wide corridor, at one end being the dining-room, 40ft. by 28ft., and at the other end the billiard-room, 40ft. by 30ft. There will also be a smoke-room, 40ft. by 17ft., a card and chess-room, 24ft. by 17ft., cloak-rooms, lavatories, and steward's office and service room. The upper floor and the floor in the roof are, with the exception of two dressing-rooms for members, devoted entirely to the kitchens, larders, laundry, matron's and servants' rooms. Messrs. Flockton, Gibbs and Flockton are the architects.

**Staffordshire.**—The consecration of a new church at Hawkesyard Priory took place last Monday week. The style of the new church is late Perpendicular Gothic, and, built with red bricks with dressings of Penkridge stone, the external appearance of the building is simple enough. The west front is rather more ornate than the rest. The main entrance is deeply recessed and moulded, and above it is a fine traceried seven-light window. In the gable above is a niche in which stands, underneath a rich canopy, a large statue of St. Thomas Aquinas, to whom the church is dedicated. This gable is flanked, like the one at the east end, by two crocketed pinnacles. To the east end is the sacristy, over a portion of which is the organ chamber reached by an external octagonal turret containing a bell. Inside the proportions are pleasing. There are nine bays, marked out by stone shafts coming about half-way down the walls. The

fifteen clerestory windows occupy nearly every bay on either side of the church. The roof is of open timber. The floor space of the church is divided into three portions. The first four bays from the main west entrance are given up to the nave. This part is paved with plain red tiles and wood blocks. Beyond this is the choir, extending the length of three bays and raised three steps. The floor is laid with tiles. Three steps more lead up to the sanctuary, which occupies the space of the remaining two bays. The floor is of mosaics of an elaborate design. In the centre are the arms of the Order, with the monogram of St. Dominic on the right, and on the left that of St. Thomas Aquinas. The high altar and reredos form a striking feature. The altar stands forward, allowing of a flight of steps at the back up to the throne. The low super-altar, in front of which stands the rich metal tabernacle by Hardman, has its six panels filled with mosaics. When completed, the reredos will rise up to the roof timber; at present only some two-thirds of it are finished. The lower portion, to the top of the super-altar, is of plain masonry, relieved by a gabled Piscina and Ambry. Above these, in the centre, are the throne and canopy, rich with delicate tracery and carving. Right and left of these rise two tiers of niches, with delicately worked shafts. When these niches are filled with statues and the upper part of the reredos containing the rood and statues of Our Lady, St. John, and other attendant figures of angels and saints, is completed, the whole composition will be striking, and will in a slight degree recall the beautiful old examples of reredos to be seen at Winchester, Christ Church, and All Souls', Oxford. The organ case, designed by Wren and originally erected at Eton, is a beautiful example of the Renaissance style. On the right of the west entrance is a richly moulded arch, opening into the chantry chapel. The chapel is richly panelled in stone, and is vaulted in fair tracery, also elaborately executed in stone; and the windows are filled with beautiful stained glass, designed by Hardman. The Lady Chapel is on the opposite side and occupies the space of two bays. The roof is panelled in wood, and the altar and reredos are of stone. In the latter is a group containing the seated figure of the Virgin and Child, and the kneeling figures of St. Dominic and St. Catharine of Siena. On the other side are carved representations of some of the mysteries of the rosary. Mr. Edward Goldie is the architect. An article on Mr. Goldie and his work appeared in our issue of December 14, 1898.

## New Companies.

### Dalbeattie Quarries, Ltd.

This company was registered with a capital of £4,000 in £1 shares with the object of carrying on the business of quarrymasters and brickmakers, &c. The registered office is at 129, St. Vincent Street, Glasgow.

### George Bence and Sons, Ltd.

This company was registered on June 8 by Jordan and Sons, Ltd., of 120, Chancery Lane, London, W.C., with a capital of £1,000 in £1 shares, to acquire the business carried on by G. Bence, as George Bence and Sons, at 43, Fairview Road, Cheltenham, and to carry on the business of hardware and building material merchants, &c. Registered without articles of association. Registered office: 43, Fairview Road, Cheltenham.

### South Berks Brick, Tile, and Pottery Company, Limited.

This company was registered on May 20th by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £50,000 in £1 shares, to adopt an agreement made between John Rankin of the one part and this company of the other part for the acquisition as a going concern of the business of brick and tile manufacturers as now carried on by the Shaw Kilns Company, Limited, to develop and extend the same, and to carry on business as manufacturers of bricks, tiles, pipes, pottery, earthenware, china, terra-cotta, and ceramic ware of all kinds; as lime burners, builders and contractors, decorators, merchants and dealers in stone, sand, lime, bricks, timber, hardware, &c.; to construct and maintain rail and tram roads; to develop the resources of land by clearing, draining, planting, farming,

or building thereon; to acquire and turn to account any patents, patent rights, and inventions; as producers and suppliers of gas and electricity, hotel keepers, restaurant proprietors; to construct and maintain telegraphs and telephones, &c. The first shareholders (each one share) are Messrs. F. S. Watts, M. A. Boulton, J. W. Spence, H. H. Osborne, J. Cope, T. C. Johns, and H. C. Bazett. The first directors—of whom there shall not be less than three nor more than seven—are J. Rankin, W. and T. McIlroy, and J. Winter. Qualification, £50. Remuneration, £175 per annum, divisible.

### Hill Park Estate Company, Ltd.

This company was registered on May 30th by Ashurst and Co., of 17, Throgmorton Avenue, London, E.C., with a capital of £15,000 in £1 shares. Its object is to enter into an agreement with W. Scott and J. M. Winter for the acquisition of the Westerham, Tatsfield, and Cudham Estates, in the counties of Kent and Surrey, and to carry on the business of builders, contractors, decorators, brick and stone merchants, &c. The first directors—to number not less than two nor more than five—are W. Scott and J. M. Winter (life directors). Remuneration as fixed by the company. Registered office: 21, Grainger Street West, Newcastle-on-Tyne.

### Crypt Discovered under Crosby Hall.

For several months the demolition of buildings round about Crosby Hall—the palace of King Edward IV., in Bishopsgate Street—has been going on, and during the operations, some pointed arches, which were probably portions of the sub-structure or cellars of the southern wing of Crosby Hall, long ago destroyed, were discovered. The arches are of fine masonry, and seem to be as strong as when the foundations of the building were laid centuries ago.

# CARBOLINEUM AVENARIUS

(REGISTERED).

## PATENT WOOD PRESERVATIVE.

**CARBOLINEUM AVENARIUS**, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

**CARBOLINEUM AVENARIUS** entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

**CARBOLINEUM AVENARIUS**, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

**PETERS, BARTSCH & CO., DERBY**, and 68, Queen St., Cheapside, London

## To All Owners and Users of Steam Boilers

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

### ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

**PETERS, BARTSCH & CO., DERBY**, and 68, Queen Street, London

## INDESTRUCTIBLE COMBINATION WASHERS

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplanned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

**PETERS, BARTSCH & CO., DERBY**

London Office: 68, QUEEN STREET, CHEAPSIDE, E.C.

# THE MANUFACTURE OF TERRA-COTTA.

## DESIGN FOR GABLE TYMPANUM.

By WILLIAM REID.

FIG. 1 shows the complete design, and Fig. 2 the gable when set in its place on the building. To give any idea of how enriched work of this sort is produced in terra-cotta, it will be necessary, in the first place, to describe briefly how the ornament is modelled. The design itself may or may not be original on the part of the modeller, for, in the majority of cases, he has to work from designs supplied by the architect. In the present instance, the first thing to be done is to have a sheet of plaster run to serve as a bed on which the ornament is to be modelled. This sheet of plaster is then varnished, because, on account of the porous nature of the material, it would be practically impossible for the modeller to work on a surface which would, in a few

modelled may only be a couple of inches thick, it is propped up on bricks as shown at Fig. 3, making its full depth or thickness about 6in. Clay is then carefully spread over these bricks so as to present a fair and clean face. The sides are the first parts modelled. A strip of clay is laid along the side to be modelled, and within the space thus formed the plaster is put in exactly the same way as already described in the article on terra-cotta mouldings in No. CCXVI. of the BUILDERS' JOURNAL. The moulding of the ornament is work requiring considerable skill, particularly if the design presents much undercutting. For the sake of clearness, loose pieces are shown at A and B, Fig. 1. At these spots the ornament is undercut; that is, it is in high relief, and curving inward in such a manner that, if the mould for this part were made by merely pouring plaster over it, it would be impossible to pull it off without destroying the ornament. Now, wherever the design appears undercut, as at A or B, what is called a "loose piece" is inserted and trimmed up with a knife to a shape like that shown in the illustration. This piece is made by surrounding the particular part with a wall of clay and filling up the space with

pressing. The mould is filled in the same manner as already described, but in more elaborate work of this sort the finishing of the clay pressing is usually done by the one who has modelled the ornament.

It will be noticed that the complete design has not been cast in one mould but has been divided into two parts. This is necessary not only on account of the difficulty there would be in handling a heavy mass of clay of this size, but because there would be great danger of the piece getting warped or twisted during firing. Indeed, if the design were a very large one, say 6ft. or 7ft. in height and of proportionate width, it would be necessary to cut it into several pieces, in which case the cuts would be made in the least prominent parts so as to make the joints as little noticeable as possible when the whole is built up.

In the illustration showing the panel built into position (Fig. 2) it is seen surrounded by a moulding. This moulding is made separately, though if the design had been small enough to permit it and the extra weight of the added moulding immaterial, it would have been run in plaster on the plaster slab before the ornament was modelled, and the

FIG. 1.

minutes, absorb all the moisture from his modelling clay. The varnish serves to close the pores of the plaster, and allows the modelled enrichment to adhere without any danger of falling off. The first thing the modeller will do is to sketch in the leading lines of the design, and block out the masses of foliage, for the present disregarding all minor details. He will then roughly suggest with clay these lines and masses, and, when satisfied with the relief and effect of this preliminary sketch, will proceed to fill in the more important details. In any case, the golden rule with modelling is to build up as much as possible, and carve away as little as possible.

In the early stages almost the only tools used are the thumb and fingers—the best of all modelling tools. The whole design, as far as possible, is carried on simultaneously; that is, no particular part is finished to the neglect of the rest, but a little is done here and a little there, so that the general effect of the whole design is constantly in view. When the modeller has finished his part of the work, the mould-maker takes it in hand. As the sheet of plaster on which the ornament has been

plaster. When the plaster is set it is pulled off, trimmed up, replaced, and either a letter or number or some distinctive mark is cut on it. Notice that all the facets of the piece are sloping outwards.

When every undercut part has been treated as at A and B, it will be seen that the remaining parts of the design, including the loose pieces, may now be safely covered with plaster, and when this is done the mould will be complete. Fig. 4 shows the complete mould turned over ready to receive the clay. As some pressure is used in filling the mould, a rope or hoop is wound round the sides in order to keep them in their places during this operation. This is known as a "piece mould." Moulds of this class for terra-cotta are somewhat easier to make than if the object to be cast were of some rigid material as, say, plaster or cement. If the ornament in terra-cotta be only very lightly undercut it is not usual to spend time making loose pieces for these parts, because the clay, when pressed into the mould, is soft and plastic, and, as it shrinks if left in the mould for a time, it becomes a simple matter to free the mould from the clay

whole cast in one mould. The method of making this moulding has been described in the issue of the BUILDERS' JOURNAL already referred to.

The clay is thoroughly dry before being fired. In the kiln the panel is set in a vertical position on its shortest edge, and boxed round with bricks to keep it in its position during the process of firing. The bricks also serve the purpose of protecting it from getting flashed or marked by coming in contact with the fire.

**Main Sewerage Works for Great Ayton** have just been completed, and about three miles of sewers have been laid. The purification of the sewage is to be effected by chemical precipitation, and the effluent will be distributed over land on the ridge and furrow system. The work has been executed by Messrs. Crudas and Son, of Guisborough, at a cost of about £4,000, and Mr. H. W. Taylor, of Newcastle and London, was the engineer.

## THE VENTILATION OF SEWERS.\*

By SIR CHARLES CAMERON, C.B., M.D.

THE ventilating openings in the street sewers, which are now so general in almost every town in the United Kingdom, have not met with universal approval. When first used many complaints were made of the unpleasant odours emitted from them. The late Sir Robert Rawlinson was wont to say when such a complaint was made, "Put more ventilators in the sewer." No doubt the larger the number of ventilators the less the odours from any one of them. Practically the sewage of Dublin is now conveyed in sewers open to the external atmosphere. If they were altogether open it would be better than their present state of being open only at certain points. The houses opposite those points receive more than their due share of whatever comes out of the sewer, whereas if the sewer were open as a ditch, every house would be treated alike to the emanations, if any, from it.

I am bound to say that as a rule there are no sensible nuisances caused by the street sewer ventilators; but there are occasional exceptions to this rule. Now and then persons complain to the Public Health Committee that the ventilators near their houses are offensive. On examination these complaints are generally found to be justifiable. Ordinary sewage generally has very little odour until it becomes stale; but now and then what may be termed exceptional sewage, having an offensive odour, flows through sewers in our streets, and it is chiefly from such sewage that the offensive emanations come through the ventilators.

The chief object in the use of ventilators is to prevent a greater pressure of the air of the sewers than that of the external atmosphere. It is assumed that the gases generated by the fermentation of the organic matter always present in sewage might cause the sewer air to acquire sufficient pressure to force the traps on the house drains connected with the sewer. I have always doubted very much that the sewer gases could acquire a pressure sufficient to displace two or three inches of water. I have made many experiments in reference to the so-called pressure in the air of sewers. I have had the sewer ventilators closed on considerable lengths of sewer mains, and have inserted delicate pressure gauges in them. I never observed any pressure except of the most trifling kind in the air of the sewers when the ventilators were closed. I did, however, notice that in the early morning, air often passed into the sewers from the streets. This descent of the air into the sewer I attributed to the insuction of air from the sewer into houses, the drains of which were untrapped or provided with defective ones. When the fires began to be lighted in the kitchens, air was drawn into the street sewers, especially in those parts of the city inhabited by the poorer classes. According to my experience, the pressure which occasionally may be observed in the sewers is sometimes caused by the wind. When a strong gale is blowing, gusts of wind enter the sewer through the ventilating opening.

The second object in ventilating sewers is to protect the workmen engaged in cleaning or repairing them. I greatly doubt that the emanations from ordinary sewage are so abundant and dangerous as to imperil life or health. The manholes should, of course, be open for some time before the sewer was entered. Deaths of workmen from inhalation of sewer gases have not been infrequent, but it has been caused not by ordinary sewage air,

but by sulphuretted hydrogen set free from refuse from gas works, or from waste gases from gas engines allowed improperly into sewers, or from other exceptional causes.

It is worth noting in connection with the subject of this paper that the sewers of one city, as large as Dublin, are not ventilated at all. This city is Bristol. Its sewers discharge their contents into a tidal river in which the water rises so high that for a large portion of the day the sewage cannot escape into the river. Bristol enjoys a remarkable immunity from typhoid fever, and I am informed that no injury to the health of the workmen who cleanse the unventilated sewers has taken place.

Notwithstanding the experience of Bristol, I confess that I am in favour of the ventilation of street sewers, though not by the means now generally employed. I object to the ordinary sewer openings in streets which are narrow and confined, and I have suggested another method of ventilation, which my colleague, Mr. S. Harty, City Engineer, has approved of, and uses under certain circumstances. In order to explain my system it is necessary to say a few words in reference to the passage of gases through certain solid substances. If we take a gas—say oxygen or hydrogen—and enclose it in a vessel of metal, glass, or glazed porcelain, it will remain there for an indefinite period; but if the vessel is composed of unglazed porcelain or plaster of Paris, the gas will rapidly pass out of it. If a galvanic porous cell be connected with a glass tube, the latter filled with water, and its open end sealed in water, and a vessel of coal or hydrogen gas be placed over the cell, the water will be immediately expelled from the tube. This phenomenon is explained as follows:—All gases diffuse in right lines in all directions. The lighter gases diffuse more rapidly than the heavier ones, and all pass through porous materials. As coal gas is lighter than air, it passes more rapidly into the cell than the air in the cell passes out of it, and therefore pressure is caused, as shown by the expulsion of water from the tube.

I have applied this property of the diffusion of gases through porous materials to the ventilation of sewers. Cylinders, composed of a mixture of two parts of porcelain clay and one of sulphate of lime, 18 in. in height and 6 in. in diameter, are used. Four or six are inserted in the crown of the sewer, and in a chamber resembling that used for the ordinary ventilators. The rain that enters the chamber from the street is carried into the sewer through a small syphon, and no wet can get at the cylinders.

As the cylinders allow air to pass freely through them, but effectually bar the passage of micro-organisms, there can be no greater pressure in the sewer air than in the street atmosphere. Air continuously comes out of the sewer, filtered through the cylinders, and air as continuously enters the sewer through the porous vessel. The action of the filter on the air resembles the action of a Pasteur filter on water.

The sewer diffuser ventilator is manufactured by Messrs. Doulton, of Lambeth, London, and Burslem, Staffordshire.

The "fresh air inlets" of the house drains are often the outlets for foul air. When they are placed in the basement areas of houses they not infrequently cause an unpleasant odour. Whenever a w.c. is flushed, the air in the soil pipe is forced out through the inlet into the external air. Mica valves are occasionally used at the inlets to prevent the gases from the soil escaping into the atmosphere. They are never airtight, and soon get out of order. A better protection against the emission of foul air through the inlet would be a porous plate such as is used in the diffuser ventilator. As every precaution is usually taken to prevent even a "pin-hole" in the soil pipe, it seems contradictory that a large opening should be made in it.

In conclusion, I may state that the sewer diffuser ventilators have given satisfaction in Dublin, and have been found efficacious. They have been in use for the last two years, and, on examination, have been found to remain quite clean.

## THE DISPUTE IN THE BUILDING TRADES.

THE settlement of the plasterers' dispute has prevented the spread of disagreement to the other branches of the building trades in the country with the exception of Yorkshire, and in particular Hull. Here it has failed to bring together the parties to the dispute, and the quarrel between the Hull masters and men is remarkable for the apparent total absence of any desire to bring it to an end.

A meeting of the Northern Centre of the National Building Trade Employers' Federation was held at the Queen's Hotel, Leeds, last Wednesday, Mr. R. Neill, of Manchester, presiding. The following resolution was passed:—"That this meeting approves of the formation of a National Conciliation Board for the building trade, but before they consent to this being formed steps must be taken to clear up the matters contained in the Yorkshire manifesto, and they agree to the suggestion of Mr. Cook, Editor of the London "Daily News," for the Yorkshire Federation to have a conference with the whole of the operatives' unions, and if this is arranged in a bona-fide manner the 25 per cent. locked out in Yorkshire will be reinstated." The co-operative scheme initiated by the Leeds branch of the London Order of Bricklayers is steadily progressing. A deputation from the Leeds Master Builders' Federation waited upon the Leeds and Yorkshire Architectural Society at their rooms in Park Street, Leeds, last Thursday afternoon, with the object of explaining the present position of the building trade as a whole, and of securing the support of the local architects in the existing crisis. The deputation was very favourably received, and an undertaking was given that the matter should be carefully considered and the Federation provided with copies of any resolutions that might be adopted.

At the Salisbury Hotel, Fleet Street, on Thursday, a conference took place between representatives of the National Association of Master Builders and of the National Association of Operative Plasterers for the purpose of making arrangements for the termination of the lock-out. Mr. E. T. Cook, editor of the "Daily News," presided. The proceedings were held in private, but at their conclusion the following memorandum was handed to Press representatives:—"Some discussion took place on an alleged breach of the agreement at Bromley, referred to in Mr. Hassall's letter of June 10th. The representatives of the National Association of Operative Plasterers denied and disavowed the action referred to. With regard to the last clause of Rule 5 (the non-unionist clause), the chairman gave it as his definite interpretation that it was intended and agreed in the discussions at the conferences that no man should be objected to as 'specially objectionable' because he may be a non-unionist. This was agreed to. It was agreed that notices should immediately be issued by the National Association of Master Builders withdrawing the lock-out notices, and work be resumed on Monday, June 19th." The cost of the plasterers' dispute to the men's Union is said to be £22,000, of which London has absorbed £8,000.

**Proposed Improvements at Tipton.**—In addition to a public park of 34 acres, the land for which was purchased in commemoration of the Diamond Jubilee, and which is being laid by the District Council at a cost of £5,000, the development of the adjacent property which consists of about 24 acres, mostly lying between the new park and the railway has been commenced. It is proposed to remove all the old structures on the land, and to erect in their place 800 houses of various types. According to present proposals the Seven Stars Inn is to be demolished and a public hall erected on its site. The development of the estate is being carried out under the direction of Messrs. Perry and Nightingale, architects, of Dudley.

\* A paper read at a meeting of the Royal Institute of Architects of Ireland on May 25th, 1899.

## Masters and Men.

**Sheffield Masons** have put in an application for an advance of 1d. per hour.

**Lancaster Plasterers** resumed work last Wednesday at an advanced wage, namely, 9½d. instead of 8½d. per hour.

**The whole of the Grimsby Bricklayers** went out on strike last week for an advance in wages of 1d. per hour.

**Chester Bricklayers' Labourers** are striking for an advance of ½d. per hour, which will make their wage 6d.

**The Dumfries Masons' Strike** has been settled on the understanding that the masters give an advance of ½d. per hour.

**Barnsley Builders' Labourers** have resumed work on a basis of mutual concession. The labourers came out on strike on May 1st, because the masters sought alterations of working rules, so that they might have greater freedom in utilising the work of the men in various ways.

**Bricklayers' Lock-out in Berlin.**—The Building Trade Employers' Association of Berlin, at a meeting held last Tuesday week, decided, with but four dissentient votes, upon an immediate lock-out of all the bricklayers in Berlin and the suburbs, rejecting the men's demands for a wage of 65 pfennig per hour.

**Four Hundred Carpenters who struck** work at Messrs. Vickers, Sons, and Maxim's shipyard, Barrow, owing to a complaint that the joiners were doing certain work on a steamer under construction which belonged to the carpenters, resumed work last Thursday, the dispute being referred to arbitration.

**The Associated Joiners on Tyneside** gave notice some three months ago of a demand for an advance of wages from 9½d. to 10d. per hour. The notice time expired on the 9th inst. The employers offered arbitration, but the men refused, and about 700 have gone on strike. About an equal number remain at work with non-associated masters, who have conceded the advance.

**The Paisley District Strike Ended.**—As a result of a conference between the representatives of the locked-out men and of the masters, the builders' labourers resumed work at the beginning of last week at their old rate of wages, 5½d. per hour. The agreement came to, however, is that the wages should be increased to 5½d. per hour from the 19th inst., and that the plasterers' labourers should, from August 1st, have their wages increased to 6d. per hour, the other labourers still remaining at 5½d.

**The Stonemasons' Strike at Wigan,** which has lasted six weeks, has come to an end. The wages are advanced to 9½d. per hour from July 1st. Certain alterations are made in the rules, and a Conciliation Board of joint representatives is appointed to deal with minor disputes. In case of future proposed alterations in the rules six months' notice is to be given, terminable on May 1st in each year. The President of the Board of Trade is empowered to appoint an umpire, failing settlement by the Joint Arbitration Board.

**Edinburgh and Leith Plumbers' Strike Ended.**—At a meeting of Edinburgh and Leith plumbers last Saturday week, a letter from the secretary of the Masters' Association was read, intimating that at a meeting on the previous Friday night it had been resolved to adopt the alterations on the rules of working, as adjusted at the conference of masters and men on Friday afternoon. The men, therefore, begin work at an increase of 1d., and there will be a minimum rate of wages for apprentices, while the Examination Board for apprentices will come into operation about the end of September.

**Edinburgh and Leith Joiners' Strike.**—Nearly seventy masters have conceded to the men's terms. An offer of arbitration has been refused by the men, and at a meeting of Edinburgh joiners' employers the recommendation to lock out 25 per cent. of the workmen throughout Scotland was favourably considered, and a meeting of joiner employers throughout the country has been convened for next week for the purpose of carrying this into effect. The Aberdeen branch of the Scottish Building Trades Federation have agreed to support the proposal of the Federation to pay off 25 per cent. of the men in their employment, with a view to bringing about a settlement of the Edinburgh strike, on the understanding that Glasgow and Dundee join in the step.

**The Great Strike in Denmark.**—The Danish employers have sent a letter to the German association of employers in the building trade explaining the motives which induced them to declare a general lock-out, and requesting the latter not to give employment to any Danish workmen during the continuance of the lock-out. The lock-out is producing so much hardship amongst the men thrown out of work that a deputation, consisting of K. M. Klausen, A. C. Meyer, labour members of the Danish Parliament, and N. Landhye, secretary to the Danish Engineers' Society, have come over to England with the object of obtaining assistance from their fellow-workers in this and other countries. They allege that whilst the Danish employers are trying to fill the places of those who are locked out with foreign workmen, they are appealing to foreign employers not to engage Danish workmen; and, further, that the following, amongst other conditions, are insisted upon by the employers:—(1) That in future no agreements shall be entered into with local organisations. (2) That the right of the employers to divide and arrange the work must be acknowledged by the heads of the workmen's organisations. (3) That foremen must not be members of trade unions. (4) That all agreements between the men and their employers shall be terminated by three months' notice on January 1st.

## Builders' Notes.

**Brechin Building Contracts.**—The contracts for the erection of a new block of workmen's houses in St. Andrew Street to the order of Mr. William Black, joiner, have been given to the following:—Mason, Mr. David Crabb; joiner, Messrs. Black and Sons; plumber, Mr. George Cuthbert; plasterer, Mr. James Gibson; and slater, Mr. William Fraser—all of Brechin.

**The Risk of Employing a Gouty Man.**—Judge Lumley Smith gave his award in the Westminster County Court on Monday last week in the case of Lloyd v. Sugg, an action under the Workmen's Compensation Act. The applicant was George Lloyd, a blacksmith, of North Kensington, aged sixty-seven, and the respondents were Messrs. Sugg and Co., gas engineers. The plaintiff's case was that he was holding a tool by means of a piece of wood, and a boy who should have hit the tool with a hammer missed it, and hit the wood. Several bones in his hand were broken by the blow, and two days afterwards he was discharged. The defendants' evidence was that no bones were broken, and that Lloyd was suffering from gout, which was brought out by the jar. The reason he was dismissed was because of bad work done before January. The boy missed the tool because a spark went in his eye. His honour's view at the former hearing was that employers took the risk of employing a man with gout in his system, and if an injury was received which brought out the gout they would be liable to compensation. He awarded the applicant 15s. a week.

## Surveying and Sanitary Notes.

**New Town Hall for Dukinfield.**—A Local Government Board inquiry was held at the Dukinfield District Council offices last Thursday into an application of the district council to borrow about £12,000, principally for the erection of a new town hall, and a small portion for sewerage. There was no opposition.

**Road Widening in Sheffield.**—The Improvement Committee of the Sheffield City Council have resolved to accept the offer of the Church Burgesses to throw out 130 square yards of land in Coleridge Road for the widening thereof, on condition that the Corporation carry out the street works over the land, estimated to cost £100.

**Birmingham Requirements.**—At a recent Local Government Board inquiry at Birmingham, it was stated that the Town Council desired to borrow £47,186 for the purposes of street improvements, £14,291 for market purposes, and £3,300 for sewerage works and surface-water drainage; £30,000 of the sum required for street improvements was for the widening of Colmore Row. The next section of the loan was for wood-paving in Resshore Road, from Sherlock Street to Priory Road. The work in Great Charles Street was being undertaken at the request of the Mason University College authorities, the traffic on the granite setts interfering with the work in the classrooms. The granite taken up would be used in repairing Kenyon Street. The work in Pasture Street and Great Charles Street, with the repairing of the footpath in Wheeler Street between New John Street and Great King Street, would amount to £14,170. One thousand pounds were wanted for the paving of Church Road, and £2,016 for widening Moat Lane. With regard to the £14,291 required for market purposes, the works for which it was required were a new cattle market in Montague Street, and the extension of the vegetable market. The application for £3,300 was for sewerage Edwardes Street, Ballsall Heath, and Church Street.

**Sanitary Inspectors' Association Conference.**—The autumn excursion to Lincoln, and Provincial Meeting and Conference at Lincoln, with Sir John Hutton as president, will take place on August 3rd to August 5th inclusive. On Thursday, August 3rd, there will be an official reception of the members at the Guildhall by the Mayor, Sheriff, members of the City Council, and Mr. C. H. Seeley, M.P., after which the conference will be opened. There will be an extraordinary general meeting for the election of members and associates, after which the opening of the Health Exhibition and a garden party at the Arboretum, at the invitation of the Mayor will take place. On the following day there will be a council meeting at the School of Science and Art, Monk's Road. The council will resume its proceedings at eleven o'clock, when the following papers will be read:—"Thirty-three Years of Sanitary Work in the City of Lincoln," by H. K. Hebb; "The Action of Sun, Air, and Vegetation, on Surface Waters," by G. M. Lowe; "The Sources of Underground Water Supplies," by T. J. Moss-Flower; "The Prevention of Smoke," by I. G. Dee; "Slaughter Houses, and Slaughter House Inspection," by George Anderson; "Construction and Sanitation of Cowsheds and Dairies," by J. F. Skinner; and "Domestic Sanitation," by William Watkins. In the evening a visit will be paid to the Corporation Electricity Works, after which the annual provincial dinner at the Saracen's Head Hotel will be held, and the day will be concluded by a grand tableaux entertainment at the exhibition. On Saturday the last day of the conference, visits will be paid to the Castle, the Museum of Roman Remains, the Newport Arch, the Cathedral, the Old Palace, and the Sewage Works.

Engineering Notes.

**The Society of Engineers Visited,** last Wednesday, the London Station and Goods Depot of the Great Central Railway, Mary-lebone.

**The Iron and Steel Institute's** autumn meeting will be held in Manchester on August 15th to 18th inclusive. The meetings on August 15th and 16th will be held in the Town Hall.

**Electric Light Installation at Barking.**—The official opening of the electricity supply works of the Barking Urban Council took place recently. The lighting station comprises an engine-room, a boiler-house, battery-room, and a shaft 100ft. high.

**Electric Glow Lamp.**—Following their success at Turin, the Improved Electric Glow Lamp Co., Ltd., of 109, Queen Victoria Street, E.C., have obtained a gold medal for their lamps at the International Exhibition, recently terminated in Rome. The result must be highly gratifying alike to the company and their customers, as testifying to the high standard of excellency and favour which their lamps have obtained.

**Overhead Tramways System at Brighton.**—At a meeting of the Brighton Town Council last Thursday a scheme of municipal tramways was accepted which will effect communication between the centre of the town, the Front, and the outlying districts. There will be eight lines, and the Tramways Committee unanimously thought that the tramways should be worked by electricity, and that the overhead wire system was the best suited to the requirements of Brighton. It was estimated that the total cost will be about £140,000.

**The Proposed Tunnel to Ireland.**—A conference was held last Monday week of members of Parliament who advocate the construction of a tunnel between Great Britain and Ireland. The Marquis of Londonderry, who presided, did not think there could be two opinions as to the extreme desirableness of the proposed tunnel. He argued that the scheme was practicable, stating that the length of the submarine tunnel by the most favourable route was twenty-five miles, and the extreme depth of water eighty-five fathoms. Lord Spencer moved a resolution to the effect that the First Lord of the Treasury be asked to receive a deputation on the subject, and Sir Mark Stewart seconded the motion, which was supported by Lord Morris; the resolution was carried unanimously. On the motion of Mr. Horace Plunkett, seconded by Sir C. M. Palmer, a small committee was appointed to arrange for the proposed deputation.

Trade and Craft.

THE ANDERSON PATENT COUPLING.

The Anderson patent lead pipe coupling is a capital appliance for connecting all sizes of lead pipes and lead to iron pipes. It possesses great pressure resisting powers, as is shown by the tests applied by Mr. W. H. Stanger. He applied a pressure of 1,000lb. per square inch to the No. 2 B  $\frac{3}{4}$ in. coupling, when the lead pipe burst, but the joint itself showed no signs whatever of leaking. The lead pipe used weighed 1.46lb. per foot. He also tested the No. 4 B  $\frac{3}{4}$ in. coupling, and in this case applied pressure up to 1,200lb. per square inch. The result was that the lead pipe, which weighed 2.4lb. per foot, burst some 7in. from the joint. His opinion was that in order to really test the absolute strength of the tightness of the coupling itself, it would be necessary to fit it to piping capable of withstanding higher pressure than the coupling. Fig. 1 shows the

FIG. 2.

FIG. 3.

method of coupling two lead pipes, which are easily and quickly adjusted. The advantage of the coupling for lead to iron pipes is the combination of union, joint, and nipple. Fig. 2 represents lead and iron pipes joined in a very strong and neat way. This coupling is supplied in the

rough, brass finished, or nickel plated, and necessitates the use of no special tools or detailed instructions. The patent lead expanding pliers, Fig. 3, are of great use in expanding the ends of lead pipes, and prevent any danger of buckling or bending the pipe. They are not only useful in fitting the Anderson coupling, but are of great value in all kinds of plumbing work, being much better than the old-fashioned wooden cones hitherto used by plumbers and coppersmiths. Any of our readers

FIG. 1.

desiring further information with regard to this coupling can obtain it from the Anderson Patent Pipe Coupling Syndicate, of Clun House, Surrey Street, London, W.C.

**The Cefnywaen New School,** near Carnarvon, is being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Railway Contractors sued for Damages.**—In the First Division of the Edinburgh Court of Session last Wednesday, before Lords Young, Trayner, and Moncreif, the settlement was intimated of an action by Wm. Paton, junior, labourer, who had sued Messrs. Robert M'Alpine and Sons, railway contractors, of 188, St. Vincent Street, Glasgow, for compensation for injuries. The plaintiff was a fireman in the employ of the defendants upon a railway in connection with a contract which they have with the Edinburgh and District Water Trust, near West Linton. On February 23rd he was standing on his engine, which was pushing a waggon, when the waggon left the rails, and, rearing up, jammed the pursuer against the fire-box. His right leg was so severely injured that it had been necessary to amputate it. It was averred that the railroad was in a defective condition, and that it was not regularly inspected. The defendants denied this, and said that the pursuer undertook his work knowing the risk of injury involved in it. They were willing to pay the plaintiff reasonable compensation. It was stated that the plaintiff had accepted an offer of £111 and expenses.

Property and Land Sales.

CHADWELL HEATH, ESSEX.—Adjoining the G.E.R. main line station, ten miles from town, and close to Ilford, the highly important and fully ripe FREEHOLD BUILDING ESTATE of 58 acres, occupying an unusually fine position, with extensive frontages to existing roads, and very favourably circumstanced for immediate development to cope with the rapidly growing demand for small villas in this locality. Gravel subsoil.

MESSRS. KEMSLEY will SELL the above by AUCTION at the MART, E.C., on MONDAY, JULY 10th, at TWO o'clock, in One Lot. Particulars of Messrs. E. F. and H. LONDON, solicitors, 53, New Broad-street, E.C.; and of the AUCTIONEERS, 41, Bishopsgate-street-within, E.C., and at Romford and Woodford Green.

FINCHLEY.—Important Sale of about 24 acres of exceedingly eligible FREEHOLD BUILDING LAND, occupying exceptionally fine and elevated positions on the main London road and Nether-street, five minutes from Finchley Junction (G.N.R.), eight miles from town, and unquestionably some of the choicest land available in the northern suburbs for immediate building operations.

MESSRS. KEMSLEY will SELL by AUCTION at the Mart, E.C., on MONDAY, JULY 10th, at TWO o'clock, in Four Lots, the valuable Freehold Properties, comprising the attractive residence, Field Cottage, Ballards-lane (the main road to Barnet), together with the outbuildings and grounds extending to about ten acres, and having valuable frontages to Ballards-lane and Long-lane; the highly important block of Building Land of nearly nine acres, situate nearly opposite the above, with extensive frontage to the main road; two blocks of very eligible Land, with valuable frontages to Nether-street, and comprising an area of about three and a quarter and two acres respectively. Each of the properties lend themselves very readily to economical development, and are in every respect adapted and thoroughly ripe for the erection of a superior class of property, for which the demand at Finchley is much in excess of the supply.

Particulars of Messrs. CARTER, VINCENT, DOUGLAS, JONES and Co., Solicitors, Bangor; of A. STOKES, Esq., Solicitor, 43, Bedford-row, W.C.; and of the AUCTIONEERS, 41, Bishopsgate-street-within, E.C., and at Woodford Green and Romford.

TO LAND SOCIETIES, BUILDERS, and SPECULATORS.—LEATHERHEAD, Surrey.—Valuable FREEHOLD BUILDING ESTATE of about 10 acres, occupying an elevated site in close proximity to the town and its two railway stations, to be SOLD by AUCTION by Messrs. WHITE and SONS, at the Swan Hotel, Leatherhead, on FRIDAY, JUNE 23rd, 1899, at Five o'clock, in One Lot. The property is ripe for development, and there is a valuable vein of gravel on it available for road making.

For particulars and conditions of sale and plans attached, apply to Messrs. WHITE and SON, Auctioneers, Land Agents, and Valuers; or Messrs. HART, SCARES, and HODGES, Solicitors, both at Dorking and Leatherhead.

SALE DAYS for the Year 1899.  
Messrs.

FAREBROTHER, ELLIS, EGERTON, BEECH, GALSWORTHY, and CO. beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, June 22	Thursday, Sept. 21
Thursday, June 29	Thursday, Oct. 12
Thursday, July 6	Thursday, Oct. 26
Thursday, July 13	Thursday, Nov. 16
Thursday, July 20	Thursday, Nov. 23
Thursday, July 27	Thursday, Dec. 7
Thursday, Aug. 3	Thursday, Dec. 14
Thursday, Aug. 10	

Messrs. FAREBROTHER, ELLIS, and CO. publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By order of the Trustees of the St. Clement Danes Holborn Estate Charity, High Holborn.—Letting on Building Leases of Valuable Sites for Shops, Trade Premises, and Dwellings.

THURGOOD and MARTIN have received instructions to LET by AUCTION, on building Leases, on WEDNESDAY, JUNE 28th, 1899, at TWO o'clock precisely, in Three Lots, Nos. 101 to 104, High Holborn, and neighbouring PLOTS of LAND on the east and west sides of Dean-street, well situate in and near the main thoroughfare from the City to the West End, in one of the busiest and widest parts, having areas varying from 7,374ft. to 3,121ft. respectively. Very valuable sites for important shops, warehouses, and dwellings.

Particulars and conditions of letting, with plans, may be had of Messrs. J. C. and W. W. ISAACSON, Solicitors, 11, New-inn, Strand, W.C.; H. C. BOYES, Esq., Ormond House, Great Trinity-lane, E.C., Architect and Surveyor to the Trustees; at the place of sale; and of the AUCTIONEERS, 27, Chancery-lane, W.C.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

R. I. B. A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum).

ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—MIDDLETON and CARDEN, 19, Craven-st., W.C.

MASON'S CHISEL, STEEL,  $\frac{1}{2}$  to  $1\frac{1}{8}$  octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from  $\frac{1}{4}$  in. to 4 in. lb.—E. DEALEY, Moore-street, Sheffield.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, at a small Terra-cotta Works near London, a thoroughly experienced KILN-SETTER and BURNER (to fill up time with pressing). Abstainer preferred.—Apply, stating terms, to "Kiln," Box, 1074 "BUILDERS' JOURNAL" Office.

QUANTITY SURVEYOR (ASSISTANT) required; must be thoroughly competent to measure up, abstract and bill.—Reply, stating experience and salary required, to M. and C., 106, Colmore Row, Birmingham.

ARCHITECT AND SURVEYOR'S ASSISTANT required in Leeds office. Must be good draughtsman. One with a knowledge of quantities preferred. State age, experience, and salary. Apply Box 1096, BUILDERS' JOURNAL Office.

CLERK of WORKS WANTED for an important Ecclesiastical Restoration. State full particulars and salary desired to "No. 133," care of Castle Lamb and Storr, 133, Salisbury Square, Fleet Street, London, E.C.

HENRY HOPE AND SONS, LIMITED, wrought steel window and casement makers and glass roofing contractors, require a London REPRESENTATIVE, with knowledge of the trade. Good opening for a smart, energetic young man. Preference given to one with experience in drawing office.—Apply by letter, stating qualifications and salary required, to 55, Lionel-street, Birmingham.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W.

ARCHITECTS and QUANTITY SURVEYORS—Temporary ASSISTANCE rendered in taking-off, measuring, &c., either by commission or the hour; reference given.—"H. R. A.," 30, Fontarabia-road, Clapham Common.

QUANTITIES prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL.

CLERK of WORKS desires RE-ENGAGEMENT (age 26); varied experience, alterations, sanitary work, working and detail drawings, specifications, and quantities; moderate salary; highest testimonials.—Box 1084, BUILDERS' JOURNAL Office.

ABLE ASSISTANCE.—WORKING and DETAIL DRAWINGS, DESIGNS, PERSPECTIVES, TRACINGS. QUANTITIES and SPECIFICATIONS, DIFFICULTIES of PRACTICE advised upon. F BRENT, 34, Great James-street, W.C.

JUNIOR ASSISTANT (disengaged), four years varied experience in Architect's and Surveyor's Office; good draughtsman; usual office routine.—Box 1099, BUILDERS' JOURNAL Office.

Patent No. 814.

# TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

**J. G. FAULDS'**

IMPROVED

## Multiplex Stone-Cutter.

*Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.*

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

## An Architectural Causerie.

**Architecture in the Novel: "The Return of the Native."**

PERHAPS no novelist has interwoven descriptions of landscape and surroundings so intimately with the movement of the story, and the actions of the chief characters as Thomas Hardy. It is not without reason that the land of his birth and art, says Lionel Johnson, was called after its ancient name Wessex. "Thomas Hardy would have us feel the sentiment of historical continuity from the old times to ours; the storms of violent fortune, the slow touches of change which have left their trace upon the land (and we might add the architecture) whilst leaving it at heart the same." He does for the Wessex country that which a German novelist appears to have partly done for the German nation, tracing, from generation to generation, the outward changes and the sentiments in each period, the effects of new and at first crude and undisciplined thought operating upon and gradually supplanting the old. In the background of these present day dramas—with their characters, some ancient and mediaeval, others partly touched by modern thought and emotion, others again who have caught the emotional trend, but lack the power and will to direct themselves wisely in the new channels—is the history of Wessex and its inhabitants; sometimes touching the reader closely, as in that description of the shearing in the ancient barn, in which the picture of to-day in its setting of four hundred years does not produce that sharp contrast between ancient and modern times; at others appealing to us in a more remote strain, as in the "Return of the Native," when the past seized upon Yeobright with its shadowy hands, and held him to listen to its tale. "His imagination would then people the spot with its ancient inhabitants, forgotten Celtic tribes trod their tracks about him, and he could almost live among them, look in their faces, and see them standing beside the barrows which swelled around, untouched and perfect as at the time of their erection. Those of the dyed barbarians who had chosen the cultivable tracts were, in comparison with those who had left their marks here, as writers on paper beside writers on parchment. Their records had perished long ago by the plough, while the works of these remained." In "The Return of the Native," there are, perhaps, fewer backgrounds of ancient buildings than in "Tess of the D'Auberville" or "Jude the Obscure," but frequent touches occur which give an architectural setting to the scene, quite as clearly as if an actual edifice had been visualised for us, or a vision pictured like the one Jude conjured up of Christminster from the top of the barn. An illustration of this occurs

in the second chapter, when humanity appears upon Egdon Heath. "The Reddleman resting by the wayside on his journey across the heath becomes aware of a form surmounting the barrow. There the form stood motionless as the hill beneath. Above the plain rose the hill, above the hill rose the barrow, above the figure was nothing that could be mapped elsewhere than on a celestial globe. Such a perfect, delicate, and necessary finish did the figure give to the pile of hills that it seemed to be the only obvious justification of their outline. Without it there was the dome without the lantern; with it the architectural demands of the mass were satisfied. The scene was strangely homogeneous; the vale, the upland, the barrow, and the figure above it amounted only to unity." Although in this, perhaps, finest novel by Thomas Hardy there are not so many deliberate pictures of the old world and its architecture, a second and third perusal will increase the reader's admira-

in the shape of a fan. Some were large and near, glowing scarlet red from the shade like wounds in a black hide. Some were Maenades with wing faces and flowing hair. These tintured the silent bosom of the clouds above and lit up their ephemeral caves which seemed thenceforth to become scalding caldrons. Perhaps as many as thirty bonfires could be counted within the whole bounds of the district. It was as if these men and boys had suddenly dived into past ages, and fetched therefrom an hour and deed, which had before been familiar with this spot. The ashes of the original British pyre which blazed from these summits lay fresh and undisturbed in the barrows beneath their tread. Festival fires to Thor and Woden had followed on the same ground and duly had their day." The passages chosen illustrate the beautiful yet sober way in which the reader is made to feel how one age is linked to another, and how in the slow changes taking place from time to time, there stands out some custom, some

BEEBLEIGH ABBEY, MALDON. DRAWN BY H. F. WARING. (See p. 305.)

tion for the genius of the writer, who, while unfolding a powerful tragedy of absorbing interest, is also giving us a picture of the past inhabitants who peopled the spot, their struggles, customs, and art, suggesting by the spirit rather than by the cataloguing of facts. In Chapter III. there is a wonderful description of the custom of the country, in which the actual scene described seems to be almost overshadowed by the pictured suggestion of the past. It is too long to quote the whole of it, but one or two extracts may give the reader some idea of the way in which a scene in the present is given an historical value, and made more impressive by being deftly linked with the past. "Red suns and tufts of fire, one by one, begin to arise, flecking the whole country around. They were the bonfires of other parishes and hamlets engaged in the same sort of commemoration. Some were distant and stood in a dense atmosphere, so that bundles of pale straw-like beams radiated around them

local rite, some ancient edifice which marks the road along which we have come, and makes present the doings of our ancestors. Another passage suggestive of the past is that where Yeobright, a very modern young man, and an itinerant open air preacher, lectures from the top of the ancient tumulus. "Round him upon the slopes of the barrow, a number of heathmen and women were reclining or sitting at their ease. They listened to the words of the man in their midst who was preaching while they abstractedly pulled heather, stripped ferns, or tossed pebbles down the slope." This scene—not at all an uncommon one at the present day—with the itinerant preacher holding forth as did his ancestors from some ancient land mark, such as a poultry cross or a market place, reminds us of the time when the freemen gathered round the moot hill to "order their own industry and to frame their own laws." Both they and the Yeobrights sought and seek the same end.

## On Reflection.

### The Royal Academy Again.

THE subject of the Reform of the Royal Academy is like the Eastern question: it is always with us,—in a more or less acute form. It has been cropping up at intervals during the last sixty years, and, if the present national indifference to artistic matters continues so long, it seems likely to form a subject for debate for sixty years to come. We are not aware that the Academy has been doing anything unusually heinous within the past few weeks, but for some reason or other there seems to be just now a general agreement to bring its shortcomings once more prominently before the public. The "Morning Post" has been devoting a good many columns to letters setting forth anew the familiar indictment: the disregard of the recommendations of the Parliamentary Committee of 1836 and the Royal Commission of 1863; the acceptance of privileges and the repudiation of the responsibilities they imply; the unfair treatment of outside artists; the bad management of the annual exhibitions, and so on. The "Daily Chronicle" has published an article showing how the Academicians monopolise "the line," and leading to the conclusion that it is almost useless for the unprivileged person to send to the Academy at all; or, to express the matter in the mathematical form adopted by the author of this curious investigation, the outsider's chance of getting his picture hung on the line is exactly 1 in 181. Other newspapers have chipped in with more or less interesting suggestions and comments, and Lord Stanley of Alderley has emphasised the criticisms by making them the text for a series of questions addressed to the Government in the House of Lords. Altogether there has been quite a little flutter of interest in the Academy during the past few days.

### Art as a Joke.

LORD SALISBURY'S reply to Lord Stanley, of Alderley, was significant in its way. It was characterised by that sarcastic humour with which the Premier is wont to enliven the discussion of matters he regards as of merely trifling importance. The questioner had recited some of the unfulfilled recommendations of the Select Committee of '36 and the Royal Commission of '63, and had asked whether the Government would give effect to these recommendations. To the plain man it might seem fairly obvious that a national institution which has been weighed in the balances and found wanting by two separate parliamentary inquiries ought to be compelled to put its house in order, or to lose some of its special privileges. That however, is not Lord Salisbury's view. It strikes him as a humorous thing that anyone should expect the recommendation of a Royal Commission to be carried out. Apparently he looks upon a Royal Commission as a sort of parlour game—innocent recreation for winter evenings; if the commissioners make a report, no one should treat it seriously,—it is all part of the game. The concerns of Art are utterly trivial in Lord Salisbury's eyes. "We are much too busy," he says in effect, "to trouble about these trifling matters. Why not let the Royal Academy muddle on as it has done in the past? It is really not much worse than it would be likely to be if we make it a Government department. And as for what a Royal Commission has said, we need not trouble about that, nobody pays any attention to Royal Commissions." Lord Stanley of Alderley is reported to have declared himself "quite satisfied" with this reply, to which we can only say that some people are very easily satisfied. And so the question of reform is brushed aside for awhile,

That it will emerge again is as certain as the rising of to-morrow's sun. But is it not a melancholy commentary on the present state of art culture and art enthusiasm in England that the Prime Minister can treat in this jocose and flippant way a question of vital importance to every artistic interest in the land, and scarcely a voice be raised in protest?

### Municipal Enterprise and its Foes.

"SOCIALISM as a living creed is a thing of the past, but it has given birth to much more dangerous reptiles. They are so shapeless that their capacity for harm is quite obscure to the peaceful citizen whose mind is rightly filled with his own immediate business concerns. The deadly poison to the life of industry and to social peace that lurks in subtle guise within the hidden fangs of this nebulous offspring of socialism is not discerned by the many: they are only attracted by the glittering, many-hued scales of its rainbow-form." These awe-inspiring words are a contribution by the "Liberty Review," the organ of the Liberty and Property Defence League, to the discussion of the interesting and not unimportant question of the proper limits of municipal enterprise. Our contemporary has observed—what is indeed a fairly patent fact—that there is a growing tendency for local authorities to concern themselves with many matters that have hitherto been either wholly neglected or regarded as belonging to the special preserves of the private speculator. That the people of a locality should, through their representatives, establish and manage for the public good such undertakings as gas and water-works, tramways, markets, baths, and libraries, seems to our contemporary a state of affairs so monstrous that it can only be fitly characterised by the amazing metaphors we have quoted. We have no doubt that many of our readers to whose lot it has fallen to have a share in the erection of a free public library or a municipal swimming bath, or in the carrying out of some other of those undertakings that fill the soul of the doctrinaire individualist with a consuming rage, have experienced an added pleasure in their work from the consciousness that it would tend rather to the well-being of a community than to the aggrandisement of an individual. However that may be, it is not easy to mistake the signs of the times; the trend of modern life is towards collective action in matters that concern the community as a whole. Though we are far from maintaining that every recent development of municipal enterprise has been wholly wise, we are in no doubt as to the essential rightness of the general movement. The L. and P.D.L. will arrest it if they can, but their efforts are not more likely to succeed than those, let us say, of the natural history student who should seek to extract deadly poison from the hidden fangs of a nebulous reptile.

### The Seine.

THE traveller who wants a beautiful trip through an unspoiled country will find it on the Newhaven and Dieppe route to Paris; at Rouen the line strikes the Seine—there a wide estuary with wooded islets; the scenery is that of Sussex, a semi-circle of downs rising behind the old capital of Normandy with its grey old towers and the immense spire of iron openwork which Viollet-le-Duc added to the cathedral shooting up into the clear sky. From this point to Paris the railway crosses the river no less than twenty-two times; the whole countryside is a garden of farms and orchards, with village spires here and there, and châteaux surrounded by that close growth of young timber which bespeaks at once a frugal people and the operation of the Code Napoleon. The stream soon begins to narrow, but it is every-

where quite a rustic river with only an occasional barge and rarely a pleasure party. Within the circuit of Paris it affords an extraordinary contrast to the Thames; its average width is 180 yards, though it is somewhat more at the Pont Neuf; the water is a clear green and spanned by a great number of bridges at very short intervals in clean-cut light stonework. It is embanked throughout, but has this peculiarity: the retaining wall does not rise sheer from the water; there is a towing path on each side of such width as to resemble a beach, and upon it at all times may be seen immense heaps and mounds of sand and gravel for building and other purposes: the height of the embankment and the great size of the buildings tend undoubtedly to dwarf the stream. The service of steamers—"the swallows of Paris"—is excellent; they are screw boats, with plenty of seats, and pass incessantly up and down the river, from Vincennes in the south-east to Meudon in the north-west. They afford a breezy, delightful method of seeing the town and are exceedingly popular with all classes; but next year they will be thronged, for the river passes right through the exhibition grounds between the Eiffel Tower and the Trocadero. The Seine lacks the majestic width of the Thames, with its great docks and shipping, the busy life of our commercial estuary, but it is bright and clean, and adds much to the beauty of Paris; its most picturesque part is where it divides into two channels surrounding the little island on which stands Notre Dame. At night it is beautiful with its many lights on the banks, its red lamps on the bridges to guide the steersmen, and the illuminated steamers shooting swiftly beneath them. London has a grander stream, but much remains to be done before it is thoroughly utilised for passenger traffic and made as beautiful as the Parisians have made the Seine.

## THE "BUILDERS' JOURNAL" COMPETITION.

### EXHIBITION OF DESIGNS.

IN response to our invitation for designs for a country house,

#### 134 Sets of Drawings

have been submitted. These will shortly be adjudicated upon by Mr. Edward S. Prior, who—as we announced last week—has consented to act as assessor. We hope to be able to publish the awards, together with reproductions of the winning designs, in our next week's issue.

By kind permission of the Committee of the Architectural Association,

#### A Public Exhibition

of the designs submitted will be held at the rooms of the Association, 56, Great Marlborough Street, W., on Monday, July 3rd, to Saturday, July 8th, between the hours of 10 a.m. and 7 p.m.

In addition to the commission for the building of the house at Hythe, which will, we hope and expect, fall to the lot of the author of one of the premiated designs, we hope to be able to place

#### Other Commissions

in the hands of some of the architects who have taken part in this competition, another client having intimated his intention of erecting houses on another estate from some of the designs sent in. Thus, not only the winner of the first premium, but five or six other competitors will, we have reason to believe, have an opportunity afforded them of carrying out, on the usual professional terms, the designs they have submitted.

ST. MARY'S CHURCH, MALDON. DRAWN BY H. F. WARING.

## MALDON.

A PICTURESQUE ESSEX  
VILLAGE DESCRIBED WITH PEN  
AND PENCIL.

By H. F. WARING.

**B**OTH from the historical and artistic point of view Maldon is interesting to artist and student alike. Many stone implements of Neolithic man have been found here, and during the excavations in connection with the Southend Railway, Roman remains, including coins, terra-cotta vessels, and implements of various kinds were come upon. About forty miles from London, situated on a hill, Maldon commands a splendid view of the surrounding country, the beauty of the scene being considerably enhanced by the winding Blackwater stretching away in the distance.

Walking up the steep hill from the station, after passing various interesting buildings, amongst others St. Peter's Church, now disused, the Town Hall, and some fine old Georgian houses, we come to All Saints' Church, one of the most interesting churches in the county. This is built in stone and flint and is especially interesting for its unique tower, which on plan is in the form of an equilateral triangle. This tower has both semi-circular and lancet windows, and is probably of the Transition period. It is surmounted by an hexagonal spire, having pinnacles at its three angles. Various theories have been put forward to account for the triangular plan—amongst others, that it is emblematic of the Trinity. The church consists of a nave of four bays and aisles of three; the pillars supporting the arches have clustered caps, they are of Purbeck marble and very delicate. The south aisle, formerly a chapel, dedicated to the Holy Trinity and containing three chantries, was founded by Robert D'Arcy, who died in 1428 and is buried here. When this was extended its interesting piscina was placed in the newer east wall. The very fine Early English sedilia on the south side attracts attention, as does also, above this, the carving running round the Early Decorated windows. The windows, in themselves, are also very fine. The north side of the church is Perpendicular, and the north aisle was taken down during the last century.

The east window is especially noticeable. This is of the same date as the sedilia, 1276, and the tracery is supposed to be the finest in the county of this date. This has been filled in with modern stained glass. Portions of the old rood screen, consisting of very well carved oak panels, may be seen at the west end. These, however, have been covered with ground-glass put on varnish while wet, to

represent stonework, as I was informed with pride. Formerly many good brasses were in this church; these, however, have mostly been taken from their stone beds.

Passing through a gateway opposite the tower of this church, we enter the courtyard of the Blue Boar Hotel, where some good half-timber work on the left hand side is to be seen. The Earls of Oxford occasionally resided at this house previous to its becoming a hostelry, and we find it mentioned in 1632.

The barn at the Spital Farm is certainly worthy of note. This is a Norman building, cruciform in plan, in the materials of which Roman tiles and bricks are found in considerable quantities, giving rise to the theory that the site was probably in former times occupied by a Roman edifice. Formerly it was a hospital for lepers, dedicated to St. Giles, and is said to have been founded by one of the English kings. In the reign of Henry IV. it reverted to the Crown, the master of the hospital having failed to do his duty.

Beeleigh Abbey was, in Mediaeval times, a religious house of much importance. It belonged to the Premonstratensian order—an order instituted in 1120 by the Archbishop of Magdeburg. Though much of the old place has been altered, a few of the old apartments happily remain unchanged. The abbey, according to the authority Leland, was founded in 1180; the monks migrated from an adjoining monastery at Great Parndon, Essex, and eventually became a powerful and rich community.

The church, it is thought, once stood in the garden of the abbey, though no trace of this can now be found. The abbey consists of a group of buildings dating from all periods; the plan, roughly, is in the form of a rectangle with projecting transepts. On the entrance door a curious knocker is seen. Continuing through a small archway, we arrive at a passage having a large doorway at the end, which formerly probably led to the cloisters; on the right a blocked up Tudor doorway is seen, which led to a still existing apartment—the refectory. This measures about 40ft. by 20ft., and is divided down its length by a row of three columns of Purbeck marble. These columns are about 6ft. high, and upon them rests a groined roof, supported on delicate corbels, opposite the pillars; these are all different. The groining is plain, consisting of chamfered stone ribs. The date of this room is probably about 1225. In the place of four lancet windows on the front wall are two large Perpendicular windows, and traces of two others. In the western wall is a large fireplace, the spandrels of which are filled in with carving. This is supposed to have been the canopy of the tomb of Henry Bouchier, Earl of Eu, in Normandy, and Essex, Lord Treasurer of England, and his lady, Isabella

Neville, sister of Richard Plantagenet, Duke of York (father of Edward IV.), both of whom, it is known, were buried in the chapel of the Virgin Mary in this abbey. He died in 1483.

An Early English stone vaulted chamber is to the north of the refectory, running east and west, with a lancet window at the east end and a door opposite. Over the refectory is a large room, also about 40ft. in length, with an open Tudor wooden arched roof; this was probably the dormitory. At the south end is a screen of oak panelling, reaching from a cross-beam, resting on brick-nogged stud-work into the roof, which it touches only by a king-post. The windows in the east front wall are evidently Tudor insertions into Early English lancets. These are six in number, of two lights each. The sills are glazed tiles, red and yellow, of the unusual size of 10in. square. On the west side are three large Early English lancets, possibly doorways, now bricked up. The doorways on the landing are also Early English, and the doorways on the other side of the passage lead to some Elizabethan rooms, which are quaint in character, but have not the remarkable features of the earlier work. The south-west apartment has in its north wall two good Perpendicular windows, each of two lights, mullioned and transomed; these are very close together, and are now blocked up. Directly beneath the two windows is a blocked up Early English doorway, corresponding to the one just against the present south door. This was probably a passage leading to the cloisters on the ground floor.

The apartment over this, on the second floor, which is reached by the original oak stairs, is called the penance chamber. Beyond this is an inner chamber, without any sign of a window; this was probably used for extreme penance. Externally, seen from the south door, the brickwork between the upright timbers is noticeable for its varied patterns. Turning to the right after leaving this doorway, we get from the outside the best view of the oldest and most interesting work of the abbey, but this purely Early English work is much spoiled in appearance by the presence of a more modern rough stone buttress. The chief feature is a very good double doorway, which is the entrance to the chapter-house. This is popularly called the chapel, but the want of a piscina and distinctive east window disproves this theory.

Entering by this door, we find that the apartment runs east and west and is divided by a row of three octagonal columns, 7ft. high, of Purbeck marble. These, together with the corbels, are of inferior workmanship and rather later date than those in the refectory. They support a groined ceiling, divided into eight bays, four of which have bosses. At the east end are two square-headed decorated windows, one blocked in, the other partially

fo, formerly of two lights each and cinquefoiled heads. The west end is the part of most interest. The double doorway, divided by triple jamb shafts, with the corners richly carved with dog tooth mouldings, has on each side a small window consisting of double lancets, divided by a jamb shaft with a quatrefoil above. Inside on the walls over the door are traces of a red-coloured frescoed pattern, as in the cellar to the north of the refectory. In both the north and south walls are two lancet windows, also a decorated window on the south, now partially blocked up. The very oldest work is at the southern end of the east

staircase in the old north wall was disclosed. A decorated doorway and the perpendicular windows are amongst the most interesting features.

In Chequers Lane, built into the wall of the Friary garden, may be seen many old stones, some being worked. These are most likely some remains of the old Carmelite friary that once stood on this site.

Leaving Maldon and crossing the Blackwater we come to the quaint little hamlet of Heybridge. The ancient name, which is used in the Domesday Survey, was Tidwolditune. The squat old late Norman church of St. Andrew first

the natural beauties of the place. The artist, indeed, need not go far to find them. Does he fancy red-roofed cottages, he has but to cross the Blackwater, and, turning, on a still evening, he will see Maldon, enshrouded in a faint mist, whilst scattered here and there gold and crimson patches flash out, as the last rays of the departing sun glint on the old tilework. Landscape, perhaps, attracts him more. Let him shake off drowsy sleep at break of day, and hie him along the sea wall to the saltings, where the herons lazily flap, and the curlew, in keeping with the intense loneliness of the scene, utters its mournful cry as it passes overhead. Here will delight seize upon his very soul, for surely nothing was ever more magnificent than the great glowing orb now fast appearing above the horizon,—the oozy mud and glistening water endeavouring to find in their depths an echo of its grandeur.

## ARCHITECTURE: WHAT IS IT?\*

BY JAMES A. MORRIS.

IN venturing once again to lecture before the Edinburgh Architectural Society, largely consisting as it does of the younger architects of Edinburgh, I think it will be well if I at once recognise that Architecture touches and overlaps many arts and many minds; and whatever our individual yearnings may be, or in whichever field of art we labour, we have a strong and common bond uniting us all, whether, indeed, we be direct workers in its broad fields, or more happily, perhaps, of those who help and encourage such by reason of sympathetic appreciation and friendly counsel.

In this room then, I take it, we are all, whether by actual work or by sympathy, labouring in some fashion together, and seeking in greater or less degree to make not our own lives only and our own surroundings, but the lives and surroundings of others also, less complex and more in harmony with the simplicity of that great and beautiful background of Nature, before which we stand, out of which we come, and part of which, in some measure, we also are.

To this end, and to the better appreciation of the purpose of my paper, I will try to make it as simple and as little technical as possible, and, in speaking of Architecture, I will endeavour to treat of it as I think you would wish; not in its technical or archaeological aspects, but in its human, and greater, and wider, and living meaning; as of a thing potent and real, as are hate and love, fear, life or death; as, indeed, the dominant art, and not without some meaning also, the mother art; for in her and under her domination all art, of whatever kind, reaches its highest excellence, whether, indeed, it be sculpture, or painting, or the humbler, but scarcely less beautiful achievement, of the craftsman's handiwork. Severed from Architecture, these all lose much of power and sweetness, and, as the migratory easel picture is less noble in degree when other than as a gem in the architectural setting, so, the more separate and divided the arts live, so much do they become less in power and potency. For, it is but a truism to say, the family of art is one and undivided.

Rather, then, than speak only of the history of Architecture, which we all know, or of any of its great cathedrals and churches, entrancing as such a subject must ever be, I would prefer to speak of the thing itself, of its spirit, of what to my mind it is; and to endeavour to show you that, to be an art at all, and not merely building, it must be an expression—best, perhaps, when an unconscious, but none the less real, expression—of ourselves and of our aspirations, such as they are; not less than of our everyday lives.

We ask ourselves, then, what is Architecture? Let me try to answer. A year or two ago,

\* A paper read before the Edinburgh Architectural Society.

front, where a square headed, a narrow lancet, and a curious low-crowned window are to be seen outside; these are all early English.

St. Mary's Church, standing on what is probably a Saxon foundation, calls for attention. Of the old Saxon church no remains are left, but of the Norman we see traces of the characteristic stonework, built into the buttresses to the tower of the new, whilst remains of the old Norman chancel arch are still visible. In the seventeenth century the tower collapsed, damaging the body of the church considerably. In 1628, Charles I. granted a royal brief for subscriptions wherewith to erect a new tower, which was rebuilt in red brick. This is a singularly graceful tower; at the same time the huge buttresses give it the appearance of massive strength. This tower, which is very conspicuous on approaching the town up the Blackwater, was originally used as a sea mark, and the hexagonal lantern of the beacon still exists. This church was totally restored when the rood

arrests attention. This building was founded in the time of Henry I. between 1160 and 1181. It consists of nave, chancel, tower, and south porch. The tower, curiously, is wider than the nave and lower, and is supported at its south-west angle by a large buttress, whilst at the north-west angle is a stair turret. In the three sides of the tower are windows, and in the jamb of the north one are many Roman tiles. The nave walls are Norman, and the characteristic semicircular doorways still remain intact. Two good Norman windows are in the nave wall. Internally, steps to the rood loft are still extant in the north wall, whilst remains of a piscina and a Purbeck marble font bowl remain. Some carved brackets under the central nave beam are interesting, as are also some old pews.

Besides the buildings mentioned are many more, all interesting, whilst numerous old sites and foundations are scattered throughout the district, making it one of great interest to the antiquarian. A word, too, must be said for

WHARVES ON THE BLACKWATER, MALDON. DRAWN BY H. F. WARING.

while waiting in a bookseller's shop, I chanced to pick up the first volume of the then recently published "Chambers' Encyclopædia," in many ways an interesting and up-to-date work, fairly representative of one side of modern thought; and as an architect, curious to see what its definition of Architecture might be, I turned to the subject, and there, in the very first sentence of the article, I found it written, that "Architecture is the art of building or construction." Now, while this may be accepted as an undoubtedly popular definition, it seems to me that one might quite as accurately define poetry as the art of grammar; for, if it be accepted that a knowledge of building or constructing is to make one an architect, it may be quite as reasonably and as logically argued that a knowledge of grammar will make one a poet—a contention as unreasonable and illogical, surely, as it is absurd.

Poetry is not merely the art or science of grammar; neither is Architecture merely the art or science of building or constructing; and we must draw a very broad distinction between these two. An architect must undoubtedly realise his architectural conceptions by the aid of good materials and sound construction; but it does not follow that either a knowledge of materials or the science of construction, or both, must of necessity make one an architect. The science of grammar, however sound its legs and wind, will never raise one to those lofty heights of imaginative thought wherein a man dreams dreams and sees visions; neither will it open to him the windows of earth, and air, and sky, and sea, and show him the glories within, which, having himself seen, he can thereafter sing of to his fellows. Moreover, while writing is one of the means, and perhaps the principal means, a poet has of expressing his thoughts, it must yet be remembered that all who write are not poets; neither, to my thinking, are all who build architects.

What, then, is Architecture? Poetry is something more than writing; and Architecture something more than building. Neither is it polished verse or balanced rhythm, that makes the truest poetry, any more than it is excessive care that constitutes big and noble thinking. First there must be in the heart the song of the poet, the musician, the architect, and then the means to voice the song will not be wanting. An old Scottish painter, a deep thinking and kindly man, said to me many years ago, "If a man has a real story to tell, something that the world is waiting to hear, then the means of telling the story will come also."

Of grammar, and building, I fear we must in truth say they are of the earth, earthly. Poetry, and the power to live the arts, is of divine origin, and can only be spiritually exercised and discerned. It will be well, then, for

us, I think, to consider of Architecture as a fine art, as it is, and not as merely utilitarian, or even commercial in its aims or end. If this be so, we must then, accept of it as something serious, something ennobling, existing in the same high world as poetry and music, and the sister arts; all of which are but different voices uttering the same high thought—"Truth!" which, said Corot, "is the first thing in Art, and the second, and the third. If a man knows, or cares, nothing for this spirit in Art, this ideal, then is he no true artist; and if he has this spirit, let it be never so feeble a spark, and does not submit to it and walk up to it, then is he no true man." The aim of an artist cannot be the accumulation of wealth, or the attainment of personal and selfish ends alone; but rather to live, as lived Michael Angelo, and, like him, to establish it as a principle that, "to live in credit is enough, if life be virtuously and honourably employed for the good of others and the benefit of posterity." This, then, is the spirit in which, I take it, we should all work, if we wish that our work should give pleasure to others, or be in itself at all lasting.

If we would only be content to be simple, and to think simply and naturally, then in the end would we learn to think bigly and well. Self-consciousness and affectation would much disappear, and if we cannot be great in ourselves we will at least be fitted to possess that next best gift, the power of discerning greatness in others. We cannot afford to play with our art, neither can we afford to

prostitute it, without hurt to our truer sensibilities.

None can trifle with, or lightly treat, what one reveres, and the lines of Matthew Arnold are as true of Architecture as they are of Poetry:—

What poets feel not when they make  
A pleasure in creating,  
The world, in its turn, will not take  
Pleasure in contemplating.

Or, as Holman Hunt recently said to painters, "If a work does not, on sober examination, give you the conviction that nature in that place is sweeter or nobler than you thought before, it is not good to you."

Is it uncharitable, then, to think that this is different, surely, from the spirit in which much of our modern work is carried through, wherein some seem to run architecture as they would a commercial business, the end and aim of which appears to be to get increase of work, and thereby money, forgetting how true in Art, above all else, are the words of Thomas Carlyle:—"The deepest depth of vulgarity is that of setting up money as the Ark of the Covenant." If we admit the necessity that to live one must make money, it does not follow that one must, of necessity, make that money by architecture. Now, we must be careful to distinguish between what has come to be called the profession of architecture, and Architecture itself; the which are two very different things. To this end, it may be well for us to-night, in

OLD LOCK, HEYBRIDGE. DRAWN BY H. F. WARING.

seeking to consider of what Architecture is, to disassociate from it altogether the merely money-getting or material business element, of which, in our daily work, we have all a sufficiently intimate acquaintance. Now, in this connection, here is a proposition, perhaps a fact, worth pondering; that as an almost invariable rule, and one with few exceptions, the biggest businesses in the architectural world, and those in which, if ever, architectural fortunes are made, are precisely those run on purely commercial principles, and those also are the businesses in which the architectural quality of the work is nearly always in the inverse ratio to the amount of work done. And why? Is it not because, through press of business, the principal often degenerates into the office feeder, merely bringing the grist to the mill, and leaving it to a

perhaps what I have indicated regarding its so-called professional, as opposed to its artistic side, may be a possible cause. He writes (I think my quotation is correct):—"Of all the arts, Architecture is the only one that has not been far surpassed by the moderns, except only statuary"—he is speaking, I take it, of classic architecture—"and as architects persist in copying the works of other men and other times, society has no respect for their productions." This latter pronouncement is irritating, because it is true; and is condemnatory of the senseless introduction of all forms and details in our buildings merely because they are old, forgetting altogether that they are in themselves sensible and beautiful, because they are parts of the expression of an ideal, and portions of a complete, but past, architectural faith and

and in the adjustment of lines one to another, that the essence of the art lies; and in that you will find the hope of attaining high excellence in great work." I have purposely directed your attention to these two opinions, because they are the expression of men of culture, intellectual prominence, and even, perhaps, of genius—men who, although not architects, are yet capable of expressing an opinion upon architecture which is of value.

To few men is a great mission in the arts given. A genius may be born perhaps once in a century; but is not genius after all just the power of seeing beyond and behind the surface of things; or as Coleridge has it, "One who carries the beauties of childhood throughout life."

As artists you and I may be very ordinary people and in our work commonplace enough, but let us at least seek to possess an ideal, and an unselfish one.

You may have been reminded a year or two ago, as I was, during the centenary celebrations of Thomas Carlyle, of one of his greatest utterances:—"All work is religion; and whatsoever work is not religion, may go and dwell among the Barbarians, Antinomians, Spinning Dervishes, or where it will: with me it shall find no harbour." No one, therefore, who does the best that in him lies, need be ashamed of his work. Of what one may be ashamed, is affectation and insincerity. In architecture especially, affectation is weakness, and insincerity is contemptible.

Our question, "What is Architecture?" Is as yet unanswered, and no one can define it for us in words. If, however, we have eyes to see, and the power to understand what we see, we will find an abundant answer in every line of a Greek temple, in every stone of a Mediaeval church, and in all work that is high in aspiration, joyous in realisation, noble in conception, and true in itself. Thus, was it, I feel sure, in those Renaissance days, wherein it was difficult sometimes to say, whether an artist was most of architect, painter, or sculptor. Those, whom it has become the custom to call "the old masters," often expressed themselves, more or less powerfully, in them all. They built, they painted, they made the dead rock all but live. Is such an age possible again? Scientific analysis, and commercial success, are the tests by which most things are judged; but still good work here and there is being done, and a hopeful sign is that among the better painters and art workers of the day, decorative feeling and a knowledge of the power of line is again being sought after and found; and when one realises that the consummation of line power is Architecture, is it over daring to assert that when a truer knowledge of what Architecture is becomes again universal, then also will it be found that under its roof-tree alone will a real union of the arts be possible?

Robert Louis Stevenson, in one of his always beautiful passages, writes: "I find I never weary of great churches." It is my favourite mountain scenery. Mankind was never so happily inspired as when it made a great cathedral—a thing as single and specious as a statue to the first glance, and yet, on examination, as lively and interesting as a forest in detail. . . . I could never fathom," he adds, "how a man dare to lift up his voice to preach in a cathedral." Is not that a sublime touch? "mountain scenery!" The great stillness and majesty and awe of the eternal hills, their grandeur and exquisite beauty, their mysterious sympathy. That one touch, to my mind, is the essence of religion, as Carlyle puts it; and yet, that mankind should have seized the very soul of the mountain, and, in a great cathedral, incarnated it in stone and lime.

If not, then, in Architecture, the earliest of all the great arts, wherein is their union to be found? To it the painter, the sculptor, the artist, the craftsman, of all degrees, have brought their best gifts. In it their work has ever found its most fitting shrine. Where else, than in a great church, can an altar-piece—the divine love of the crucifixion, the human love of a Madonna—find best its material counterpart? Where else do the glories of stained glass awaken so responsive thoughts?

MALDON HILL. DRAWN BY H. F. WARING. (See p. 305.)

more or less competent staff to attend to its grinding? While the deepest depth of all is surely that in which a lightly principled man gets into his employment a gifted draughtsman whose shoe's latchet he is, architecturally, unworthy to unloose, and by whose skill, and by whose brains alone, work is produced, of which he has been incompetent to guide a single stroke, barely to suggest a single form; but which he claims as his own, and publicly says so, because, forsooth, it emanated from his office, and he has paid for it. To my mind, and in plain English, such a course is perilously near simple fraud—and fraud, too, of the meanest kind. For surely none would ask another to paint a picture, or write a sonnet, and subscribe it with his own name! Or would any honest man draw a cheque on another's credit? The law punishes the one as fraud, because what is stolen is money; but the other filches brains only, and is oftentimes accounted an able organiser.

I have read somewhere, that Herbert Spencer's opinion of every-day architecture is poor, and

achievement; just as in the human figure, each several part is necessary to, and fitly fulfils, its own function. Add to a leg a second foot, or an additional finger to a hand, and the result is a monstrosity, little less offensive, than the ignorant interchange or senseless reproduction of old forms and details, from which the use, and meaning even, have in the transfer been severed. Architecture must be creative, not selective; least of all, selective without knowledge.

Mr. Gladstone, again, was no inconsiderable observer, and had never a word, I think, of praise for modern architecture. One circumstance in domestic architecture terrified him—the redundancy of bad ornament. "You will find," he once said, "that the architect had either a horror or a dread of leaving bare a single square foot of wall, as if there was something indecent in so doing;" and he fitly added, "excess of ornament is of all things the most hostile to a due appreciation of proportion, because it is in proportion to the perception of breadth and beauty and line,

Where else is music so grand, and solemn, and helpful, as when it soars to the highest of heights, and fills the loftiest of dim vaults with its voice, human and divine; while the light from rich glass suffuses its full tones with kindred colour? Can the arts dwell together more fittingly united than when enshrined in such architecture? Can any great picture gallery, be the light never so perfect, give the same sense of unperplexed rest to any art work as does a great church? It somehow, to me, seems to breathe the spirit of those most exquisite of all lines, in all languages:—

He maketh me to lie down in green pastures,  
He leadeth me beside the still waters.

I once heard Architecture defined—and, at first utterance, I was much surprised—as “a materialised embodiment of faith raised to the glory of God in all its parts and details, symbolising His divine attributes.” Perhaps this attempt at a definition is not wholly wrong; and, at least, most thinking men will give it higher place than that other definition, “Architecture is the art of building or constructing.”

Therefore it may have been that in those older days, wherein artists laid what was best in them at the feet of worship, they were wise in seeking their inspiration from the highest source, and in offering there the best gifts. Architects, painters, sculptors then joined hands in one person, or in a brotherhood; and a real union of the arts may again, perhaps, be found when artists realise their kinship and their common need; for their manner of thought, and work, and aim, are indeed one.

Contrast, then, this past relationship with the present divorce. In our own day, and as society becomes more complex, art is in danger of becoming specialised; and there has grown up, in consequence, a severance between the arts, and a dislocation of art terms, which is altogether unnatural. In painting, we have now the portrait painter, the landscape painter, and all sorts of varieties. Just as in architecture, have we not the church architect, the house architect, the hospital architect, and many others? Now, wherein such men become specialists, is not because architecture is specialised, but because they possess a very complete knowledge of the utilitarian or practical requirements of their particular subjects. A man may have the most consummate knowledge of hospital requirements, and may build a most perfect hospital—so far as immediate hospital requirements are concerned—but while such requirements are, in themselves, most excellent and necessary, they can yet never, in themselves, be Architecture. By a large section of the general public, however, they have, unfortunately, as I think, come to be so recognised; and an architect is too often judged, not by his architecture, but by his practical knowledge and skill; and therein lies much of evil. Now, I do not wish anyone to go away with the idea that architects ought to have their heads in the clouds and nothing at all to do with what concerns the practical needs of our day. On the contrary, we have in truth a great deal to do with them; only they are not in themselves Architecture.

Now, it is not by any means impossible to make the most prosaic of buildings architectural. Instance, Dance's Newgate Prison. Architecture is not a mere covering, separate and apart from what it covers, like a garment, which may be taken from off one and worn equally well, perhaps, by another. It is not only the outward expression of that which is within, but it is a part of it; and every line or feature, every detail, which is without meaning, and which is not essential to the building, should be unsparingly removed. The whole building should express what it is, and what the architect has to say by it, just as a picture speaks, or a poem, or music. This is what I take to be the spirit of Architecture, and of all the arts; but it is not, I much fear, generally so understood by the public, to its own loss and ours. In this Society, however, none of us, I feel sure, belong to that exclusive class of people who can see no good thing at all in the public; but neither do we fall down and

blindly worship the voice of the people as the voice of the gods. In a general way, we all much respect the public, and where a matter of the heart is concerned the public is often right. But the public, all the same, is hard to be interested in what does not apparently affect it. Applied science appeals to it strongly, because its marvellous results meet directly its daily needs; but Art, which is equally real, only less direct, and more subtle in its application, it does not care to be puzzled over, and what the public does not easily understand it dislikes, and even resents. Any sentiment it has to spare it likes to have invoked by sentiment, plain beyond a doubt. A woman in black, young if you will, crying! An empty cradle! A little sock in her hand, or a shoe! Take the most pathetic and sacred grief on earth, only make the crape broad enough, and the attitude the conventional one of woe, and the public is content, forgetting all the while, that a true painter can impart to the woman something of the divine holiness of God's love; and our share, in the mystery of what we call death; and can open for us, in part also, the windows of heaven, so that we can, in some measure, see with Him, into the revelation of the beyond. My wish is to try, imperfectly enough, I know, but yet in so far as I may, to utter something of the truth and nobleness of Art, and to lift it, at least a little, beyond the current exchange of pence, shillings and pounds. I know that the public well likes to see what it considers value for its money, and no one can blame it; but the great mass of the people have their eyes so blinded to what art really is, that a large portion of them are content with a German lithograph; and an oleograph is, to them, as eloquent as a Madonna by Raphael. Unfortunately, by many of all classes, Art is much looked upon as a thing to minister to their pleasure, or amusement. To some, it is merely the “correct thing,” and therefore right. It is in many mouths, but in few hearts. Now, our Cinderella is just waiting for her Prince. There have always been individuals, or groups, with quiet insistence, telling us of better things. In our own day, take the pre-Raphaelite brotherhood. See Whistler among the prophets; and in Scotland, look at what is called the Glasgow School of Painting. In Architecture, is there not also a shaking of the dry bones? With the encouragement afforded you in Edinburgh by the example of one still happily among you, as among us—for I speak as a Scots architect—surely you in Edinburgh have especial cause of confidence and hope. In any case to you younger men it is that much of the future belongs, and the time seems one of promise.

Consider some of those famous pictures which in recent years have found welcome place in many homes. Look at certain modern metal work, certain fabrics, pottery, glass, furniture. Surely there is not wanting indication of better things in these; and could such things in themselves be, were there not an art culture, an art knowledge, or an art desire, somewhere in the land? Moreover, would such pictures, such surroundings, have been desired, save by men of taste, or, at least, by an awakened appreciation of true art? Art, of all things, needs discerning sympathy; and when the people again become artists, then must art again naturally flourish, and with a power greater, perhaps, even than of old.

It is then for the younger men to join with painters, and sculptors, and art craftsmen of all kinds; learning from them, but teaching also. Then you will find that artists are all treading the same path and working for the same end; and so close is their relationship, and so needful their mutual help, that only so unnatural a thing as divorce could ever have separated them; but, reunited, they learn each much of the other's craft, and so united, they may again perhaps, form a brotherhood of art. Look at the few, but hopeful instances, in which artists and craftsmen have joined together in our own day. See Sedding's church at Chelsea, where architect, painter, sculptor, craftsmen, all worked together for a common end. And in Edinburgh, look, if I may venture to allude to it, at the wonderful work presently being wrought

in the Catholic Apostolic Church in Mansfield Place. Would it be possible for this Society to yet widen its sphere of influence, to make itself a yet stronger power in the art life of Edinburgh by welcoming within its walls and bringing within touch of its members, not only architects, but painters, sculptors, poets—if you can get them—musicians, and art craftsmen of every kind?

Speaking to younger men always leads one to think of training and education, for an architect is ever a student, and while avoiding all vexed questions of examination, for which much can be said against and for, or even the training of artists in any branch of art, certain words of a speaker at Oxford on some dangers of modern education may be aptly quoted. “The other danger,” he said, “was that, under undue pressure from without, they should lean, for ever so little, to that theory of education which would have us to construct machines of so many horse-power, rather than to form character, and to rear into true excellence that marvellous creature called man—and should seek to prepare for success in life, instead of securing that a man shall always be greater than his work, and never bounded by it.”

Now, in Edinburgh, what your art schools or training colleges are, I cannot tell, neither can I say whether or no in their teaching they approach this high altitude. If, however, for a moment, I may venture to interpolate a word upon the training of young artists, I would say with all my heart I think it well a student be taught to draw in clay, or in colour, or with whatsoever he will, provided he can best express himself therein; and teaching that seeks to adapt itself to the individual student, rather than to subordinate the student to the school, is to my judgment, wise and sound teaching. And for architects, Architecture should be set forth in its broad and true meaning and spirit, as a living Art, and not an antiquarian fact, as a thing of subtler essence and form than either building or constructing merely; and even though in achievement it be a thing solid and mighty, to be raised of the earth, and on its great surface, it is still to be a thing of beauty, a thing also which mother earth may, with her other great children, bear proudly on her own broad bosom, and be not ashamed. If, then, architecture is such as this, visible and real, a thing, remember, upon which the light of day is to shine, not from one point only, but from every quarter under heaven, surely, then, it is not a thing to be thought of as a flat surface only, or to be taught, as on a drawing board alone, with compass and square, but rather as a thing to be conceived of in the round, to be walked about and looked at and considered; to become also in after years a veritable part of nature, its asperities softened by her kindly touch, and enriched with the vesturing of her glowing colour, till in the end it is received by Nature as akin to her in spirit, for then those who fashion material into architecture shall have learnt also that the life is ever “more than meat, and the body than raiment.”

Now, in architecture, I think, it is a good thing for a man to have had an Edinburgh training. In a past day it was my lot to meet many of the younger Edinburgh men in London, and whether it was the result of their school or their office education I do not know, but they were then, and, I rejoice to hear, are still, men of abundant promise, taking prominent place among the architects of that great city. And I can speak thus freely in your ears, for I am not, in any sense, an Edinburgh man. And further, it is always pleasant to utter words of encouragement to any, when the words so uttered are those of truth and moderation.

And now, turning our thoughts to other lands, let us look for a moment at the Florence of the early fifteenth century, and consider the training in art and life of one Filippo Brunelleschi, born there in 1377. Filippo was the son of a notary of good renown and a very praiseworthy man. His mother, an excellent woman, was one of the noble family of the Spini. He was a man little of stature and not comely to look upon, but full of nobleness of soul, eloquence, and force of

character, a kindly man, and of benign and amiable disposition. In judgment he was calm and dispassionate, and laid aside all thought of his own interest and even that of his friends whenever he perceived the merits and talents of others so required. He knew himself, and from the stores of his own genius instructed many. He was ever ready to succour a neighbour in all his necessities, and he declared himself the confirmed enemy of all vice, and the friend of those who laboured in the course of virtue. He did not spend his moments vainly, and, although always busy with his own work, was ever ready to assist others. Such is a brief epitome from Vasari of the character of the man. In his childhood Filippo was taught by his father the rudiments of learning with the utmost care, and he learned quickly; but as he grew up he would neither follow the calling of a notary like his father nor yet that of a physician like his grand and great-grandfathers, the latter of whom had been a most eminent man. All this caused much displeasure to his father, who at length placed him in the guild of goldsmiths, that he might acquire the art of design, he having been constantly intent on questions of art and mechanics. Filippo set precious stones most excellently, and presently over-stepped the limits of the goldsmith's calling. He studied the division of time, the adjustment of weights, the movement of wheels, and made watches. Being seized with an earnest desire to attempt the art of sculpture, he sought the acquaintance of Donatello, then a youth of great promise, and a few years younger than himself; and they became most strongly attached one to the other. He studied architecture, and decorated houses. He also, in certain existing buildings, constructed doors and windows, not in the Gothic, but, after the manner of the ancients, in the Classic style—a thing, apparently, not then very frequently done. He executed a statue of Santa Maria Maddalena in linden wood for the monks of Santo Spirito. He discovered a correct method of perspective, then a new art, and made many drawings therein. He instructed those who worked in tarsia, and from his time better work therein prevailed. He turned his attention to the scriptures, and attended much the disputations and preachings of learned men. At the same time he gave earnest study to the works of Dante, and discussed all things with Donatello; than whom he could find none other, so much to his satisfaction. Now here is a characteristic little story of these simple days. Donatello had made a crucifix of wood for the church of Santa Croce, and asking the opinion of Filippo thereon, received for answer, that he had "placed a clown, and not a Christ, upon the cross." Donatello, hurt, replied "Take wood, then, and make one thyself." Filippo, who never suffered himself to be angered, did not reply; but several months afterwards, when, with Donatello, having purchased in the market place eggs and other things, upon which they were to dine, and having placed them in Donatello's apron, Filippo sent him forward to his house till he should afterwards follow; and when poor Donatello entered the room in which was a wood crucifix carefully placed, on which Filippo had worked during these months, of the same size as Donatello's in Santa Croce, he was amazed, and in his amazement suffered the contents of his apron to fall unheeded to the floor. Donatello's "Take wood and make one thyself," had been answered; and he—kindly soul—not only confessed himself conquered, but declared the work a miracle.

The talents of these two young men, having been perceived, they were commissioned by the Guild of Butchers and the Guild of Joiners, each to erect a figure in marble, for niches in San Michele; but Filippo, being occupied with other affairs, suffered Donatello to execute both; and the result is those two famous statues of St. Peter and St. Mark, which, with his St. George, are renowned far beyond Florence and Italy.

Now, those of you who think competitions are a modern invention of the evil one, be good enough to listen carefully. In 1401 it was resolved to reconstruct the two remaining

doors of the church and baptistry of San Giovanni—the glorious south doors of which had already been executed in 1330 by Andrea Pisano. Tuscan sculptors were invited to submit designs, and among those who competed were Filippo (aged twenty-four), Donatello (aged from fifteen to nineteen—the exact date of his birth is uncertain), and Lorenzo Ghiberti (aged twenty). One year was allowed for the preparation of the work—while we weakly moderns are asked to design palaces in three months—and on its expiration, when the works were placed together, and exhibited without mottoes—listen again carefully—instead of each man crying up his own wares, Filippo and Donatello, perceiving that Ghiberti's was better than theirs, and best of all, they, by the good reasons they gave, persuaded the Signoria and Opera to give the doors to Ghiberti, and, that he might alone have all the credit, Filippo, when requested to undertake the work in concert with Lorenzo, refused, "desiring rather to be first in some other art," than an equal merely with another, and to the detriment to both. How aptly to this admirable unselfishness do the lines of our own Tennyson apply:—

An artist, sir, should rest in art,  
And waive a little of his claim;  
To have the great, poetic heart  
Is more than all poetic fame.

And, by way of contrast, even in those days, note hereafter, Ghiberti's unhandsome repayment.

(To be concluded.)

## R. I. B. A.

### ROYAL GOLD MEDAL, 1899.

PRESENTATION TO MR. G. F. BODLEY, A.R.A.

MR. W. MILNER FAWCETT presided at the meeting of the Institute last Monday evening, in the absence of Prof. Aitchison, who, it was announced, was unfortunately indisposed, and was prohibited by his doctor him from attending. A letter was read from Sir L. Alma Tadema, expressing his regret that he was unable to be present. There was a fair number of ladies at the meeting, and the room was full. The minutes of the last meeting were taken as read, and members attending for the first time since their election were cordially welcomed by the vice-president.

The Royal Gold Medal of 1899 for the promotion of architecture has been presented to Mr. G. F. Bodley, A.R.A., F.R.I.B.A.

#### The Presentation

was made by Mr. W. Milner Fawcett, who said he was very sorry that Professor Aitchison was unable to be there to give the gold medal to Mr. Bodley. Mr. Fawcett said that he had known Mr. Bodley for longer than he had known any one else in the room. If long acquaintance and friendship were any titles to having the honour of presenting the medal to his friend, he had them. He had also a further title, in the fact that he had always been a great admirer of Mr. Bodley's works. He was a true artist, whose designs and conceptions would receive the approval and veneration of generations to come. They had the further pleasure of welcoming him among them as a Fellow (cheers). They all knew the broad view taken by the Institute; there had never been any wish to coerce any architect to join. They rejoiced in having Mr. Bodley in their ranks. His work was so well known to all of them that there was no comment needed from him. The chairman then instanced several of Mr. Bodley's well-known works. He mentioned that Mr. Bodley was at first infected with the

#### French Style Fever,

but he soon overcame it. He said that the dean and chapter of Peterborough Cathedral were to be congratulated in having obtained Mr. Bodley's services for the restoration of the cathedral. All Mr. Bodley's work evidenced his delicate care to obtain simplicity, truth,

and repose. He had also shown great power in carrying out decorative work in colour. It was, therefore, with great pleasure that he had the honour of presenting the gold medal to him, and he was sure that all the members felt the honour of having such a distinguished artist among them (loud applause). Mr. Bodley, who was received with acclamation, said that in more ways than one he was unprepared to say anything to them that night. He had been labouring under the mistake that the next day was to be the presentation day. The honour they had given him was unexpected. He was afraid he had not been a dutiful member of the Institute. Not many years ago he took part with Mr. Jackson and others in writing papers, rather

#### Arguing Against Examinations

as a test for being an architect. He was afraid the principle had one failing, and that was that it was likely to tend towards making the architect less of an artist, and making the work less of an art, and rather too much of a profession. He thought he owed the honour of receiving the gold medal, perhaps, more especially to his care for what he held to be the most beautiful style—English Gothic. (Cheers.) It would be much better if they could obtain one style for their service. They wanted refinement in their buildings. He thanked them all very much for the honour they had bestowed upon him. Mr. Aston Webb, A.R.A., spoke of the admirable manner in which Professor Aitchison had carried out his presidential duties during the three years he had occupied the position of president, and proposed that a vote of thanks be passed. This was seconded by Mr. H. H. Statham, and carried unanimously. Mr. Fawcett then introduced

#### The New Chairman,

who said that he had been filling the post of honorary secretary for a number of years, evidently to their satisfaction, he was glad to say, otherwise they would not have elected him as president. When he thought of all the great men who had occupied the post he was to hold, he was impressed with the difficulty of keeping up to their standard. But he hoped, with their kind consideration of all his actions, to be able to do his duty honourably. After the announcement that the session was closed the meeting terminated.

**The Church of St. John's, Timberhill, Norwich,** is being improved by the screening off of the organ chamber on the one side of the chancel, and the utilising of a portion of the aisles on the other side as a Lady Chapel. The screen dividing the south aisle has just been finished and is of solid oak. It is perpendicular in style, and divided into five bays, two on either side of the main opening, which is closed by ornamental iron gates, somewhat uniform with the gates which shut off the nave from the chancel. Overhead is a carved canopy with dropped tracery, having carved cusplings and crockets running to a finial which stands below a heavily moulded and carved cornice, this, in turn, being surmounted by an elaborate cresting of a pomegranate design, the fruit carved in varying patterns. In the top of each bay the tracery is deeply cut with counter mouldings and rich cusplings, animals and birds forming the subject. The jambs and mullions are deeply moulded, with a buttress standing on a moulded base, carrying a double table set-off. A circular shaft runs from each, having a carved base surmounted by a handsome finial. The bottom panels, intended as painted panels, are also headed with tracery. The design is the work of Mr. A. Weston, of Norwich; and the carver is Mr. C. W. Brown, of William Street, Norwich.

**AN EXHIBITION** of special interest to all readers of the **BUILDERS' JOURNAL AND ARCHITECTURAL RECORD** is to be held next week in the Rooms of the Architectural Association, 56, Great Marlborough Street. For further particulars see the announcement on page 304.

## THE WEST FRONT OF BATH ABBEY.

By E. M. HICK.

THIS year, being the 400th anniversary of the erection of the present Bath Abbey, it has been decided to commemorate the event by judiciously repairing the famous west front, and Mr. Jackson, R.A., has been appointed architect by the Restoration Committee. Its restoration was contemplated early in "the seventies," but luckily had to be abandoned for lack of funds before much damage was done. I say "luckily," because what little was done was quite sufficient to show that the restoration would not have been carried out in a very conservative spirit. Some of the figures have been removed from the upper portion, and stone blocks inserted, out of which it was no doubt intended to form their successors.

Before alluding more particularly to the west front, it is necessary to mention one or two historic facts connected with the church.

John de Villula, First Bishop of Bath, on his appointment in 1092, pulled down the old seventh century church in which Eadgar had been crowned, and built a vast Norman cathedral in its stead. The more ancient see of Wells, which had been without a bishop since the foundation of the new see, was united to it in 1218; and from that date Bath Cathedral was allowed gradually to decay, so that when Oliver King was appointed Bishop of Bath and Wells in 1496, the greater part of the church was a ruin. With this bishop's appointment the history of the present church may be said to have begun. He removed the ruins of the Norman cathedral, and, on the site of the nave, began the present church, which, wrote the late Professor Freeman, is "the only cathedral church altogether in the Perpendicular style."

The story goes that the good Bishop was moved to undertake the rebuilding by a dream, in which he beheld the Holy Trinity with angels ascending and descending a ladder; at the foot of the ladder grew an olive tree supporting a crown, and a voice cried—"Let an *live* establish the crown, and a *King* restore the church." Like the humble man that he was, he firstly understood these words to refer to his master the King. "*Olive*," the emblem of peace and plenty, was surely only another way of saying "Henry VII.!" Nevertheless, the humblest could not but find in the words "*Olive*" and "*King*" a very thin veiling of the bishop's own name; moreover, as Secretary of State and late Ambassador to France, which mission he had concluded with conspicuous success, he might very well have been said to have established the crown; what men should hinder him from restoring the church?

The pretty story is, however, somewhat spoiled when we learn that His Lordship cut down the expenditure of the Priory from £80 16s. 6d. to £135 6s. 8d. per annum, allowing the Prior £5 6s. 8d. and the monks £5 each per annum, to enable him to raise funds, and no doubt with an eye to a due economy being observed in the neighbourhood of theiscopal purse! Oliver King caused this dream to be portrayed on the west front of the new cathedral, which is in fact "a dream stone."

He did not live to see his great work finished, neither did his able *confrère*, Prior Bird, who reduced himself to poverty in his enthusiasm, and now lies at rest under the exquisite chantry chapel to the south of the high altar. Bishop King's will was to be altered in his new cathedral, but, for some reason unknown, he lies in St. George's Chapel, Windsor.

The four following bishops, viz., Cardinal Castello, Cardinal Wolsey, Clark, and Knight, are said to have done nothing towards the completion of the fabric; and the following verses were written on the wall with charcoal:

"O Church! I wail thy wofull plight,  
Whom King, nor Card'nall, Clerke, nor Knight,  
Have yet restored to ancient right."

If this be true, it is somewhat strange that

Castello's arms appear both on the west front and on the fan vaulting of the choir.

To Bishop Montague (1608 to 1616) belongs the honour of completing the church. He was translated to Winchester, but is buried here. The great west doors are, I believe, a brother's memorial of the good bishop.

Bishop King's dream is the best description of the west front, and the general scheme is readily grasped by a glance at the sketch reproduced in one of the centre plates; but a few notes on the individual parts will not be out of place here.

The Holy Trinity is represented as occupying the niche above the great west window, the spandrels of which are filled with the Heavenly Host; the ladders on the staircase turrets are flanked by the twelve Apostles in niches, and at the foot of the ladders grow olive trees, springing through crowns and surmounted by mitres. From the tracery of the great west window, issues a dove. The spandrels of the great west doorway are filled with the emblems of the Passion; the niche above is now empty, but the arms beneath it are those of Henry VII.; those flanking the doorway are filled by statues of the patron saints, Peter and Paul. The doors themselves are fine specimens of Jacobean heraldic carving. Above the aisle windows, the words "*Domus mea*" and "*Domus orōnis*" can still be deciphered.

An old motto, said to have been carved on the west front, but now obliterated, might well be taken to heart by the architect who will be called upon to make the necessary repairs, "*De sursum est*"—"It is from on high."

## CARPENTERS' COMPANY'S EXAMINATIONS.

THE numbers attending the series of lectures delivered to the candidates for the Carpenters' Company's Examination in Carpentry and Joinery have been larger this year than in any previous one, and this is a welcome sign that workmen, manual training instructors, and others, are appreciating the Company's efforts, and showing that such lectures as these are very helpful in completing the training gained in the builder's workshop and in the technical schools in London. That the certificate granted to successful candidates is of great and increasing value is evidenced by the greatly increased number of entries for the examination itself. These are greater by at least a third than they have ever been before. Candidates are by no means confined to London, although naturally the greater number find their homes in the metropolis or the suburbs, but there are entries from Leeds, Tunbridge Wells, Maidstone, and other places. The examiners were Sir Alexander Binnie, Professors Banister, Fletcher, and J. Roger-Smith, Mr. Randall, President of the Institute of Builders, and others.

The following is the list of successful candidates arranged in order of merit:—

*First Class.*—Wm. Bevan, F. J. Griffiths (winners of silver medals); Geo. Ellis, W. H. Richardson Jones, Jno. Lawrence (winners of bronze medals); W. O. Brown, Arthur Norton, J. E. Paynter, J. W. Appleyard, G. H. Griffiths, E. R. Livermore, W. H. Morrish, J. S. Knight, and Tom Pilgrim.

*Second Class.*—S. W. Hayward, T. C. Noble, E. W. F. Martin, H. T. Barnes, H. D. Trendall, J. H. Sills, F. Tompkins, F. J. Allman, S. J. Stevens, D. Hunter, E. W. Bell, G. J. Boog, J. R. Heatley, F. Batten, F. C. Brown, A. E. Davis, C. H. Hayward, E. J. Martin, R. H. Griffith, A. D. White, Thos. Tanton, Walter Pither, and Jno. Perrin.

Candidates already holding the Company's certificate, &c., who came up to improve their position and failed to do so do not appear in the above list, although they may have maintained their former position.

**Collapse of a Tunnel.**—A large portion of the Cockett Tunnel, on the Great Western Railway, near Swansea, fell in last week.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

## ARTS AND CRAFTS EXHIBITION.

To the Editor of THE BUILDERS' JOURNAL.

LOUGHBOROUGH.

SIR,—Will you inform me when the Arts and Crafts Exhibition will be held this year in London; also from whom I can get particulars of same?—Yours, &c., A. L. R.

This year's exhibition will be held in the New Gallery, 121, Regent Street, London, from Monday, October 9th, to Saturday, December 9th. Work intended for exhibition must be received at the New Gallery between 8 a.m. and 8 p.m. on Monday, Tuesday, and Wednesday, September 18th, 19th, and 20th. Further particulars can be had on application to the Secretary, Arts and Crafts Exhibition Society, The New Gallery, 121, Regent Street, W.

## BUILDING WALL OVER SHOP.

To the Editor of THE BUILDERS' JOURNAL.

TORQUAY.

DEAR SIR,—Would you or any of your readers kindly give me your opinion of the following:—I am altering some business premises, and am putting a shop front on ground floor, with two stories over, and in submitting my plans for approval to the local authorities, I showed a 9in. wall over shop, carried on a rolled steel joist. This wall, being only 23ft. high, I considered in accordance with the Building Bye-law which says that walls up to 20ft. high and not exceeding 30ft. in length shall be 9in. thick for their whole height, the height being measured from top of footings. The local authorities insist upon the lower part of the wall being 14in. thick, as it would have been if the wall had been brought up from the ground. The question is this: must the height of the wall be measured from the top of footings as if shop front had not been inserted, or can the top of the girder be considered in effect the top of the footings for the wall? JAY.

The height of the wall must, I think, be measured from the top of the footings, and not the top of the girder. H. P. B.

## The Restoration of Llangathen Church.

Carmarthenshire, has been decided upon. The present chancel arch, chancel roof, east window, and the arcade between the chancel and the Aberglasney Chapel, which have lost all semblance of Gothic, will be replaced with something more appropriate. The Cadran Chapel, on the north side of the nave, is to be renovated. At present the internal walls are plastered, and it will be interesting to know what work the plaster may conceal, as a small piscina, with a four-centred head, a Gothic recessed tomb, and an imposing Renaissance tomb, seem to show that at one time the church was of considerable importance. Mr. R. W. Thomas, of Llandrindod, is the architect.

## Manchester Newspaper Kiosks.

At a meeting of the Manchester Watch Committee it was stated that certain sites had been accepted by the Paving and Highways Committee as suitable for the erection of newspaper kiosks. These are as follow:—Albert Square, Cross Street (near Cross Street Chapel), Old Millgate, Infirmary Esplanade (two kiosks), near the Art Gallery in Mosley Street (subject to certain arrangements being made), All Saints' Esplanade, and near St. Peter's Church, Lower Mosley Street. A tasteful design for a kiosk has been prepared by the City Surveyor. It is proposed that the base of the structure shall be octagonal, and the height about 9ft. It is suggested that an experiment should be made on one or two sites before the entire scheme is carried out.

[illegible]

**POSTAGE BOOK.**—Columns for date, to whom, address, postage.

**PRESS-COPY ACCOUNT BOOK.**—No account to be sent out without being press-copied. Entries to be made from this book to the Commissions Book, to be kept closely indexed.

**PRESS-COPY LETTER BOOK.**—Every letter sent out to be press-copied; this book to be carefully indexed.

**WAGES BOOK.**—This book should have columns for date, name, amount of wages, the total to be drawn from the bank periodically.

I have refrained from giving a set of *pro forma* accounts, as I consider they are never very satisfactory, but I have contented myself by showing the rulings of the various books, and referring to the working in the letterpress, leaving readers to fill in any imaginary figures they feel inclined to supply. The lines I have laid down I hope will be considered simple and concise, as well as sufficiently comprehensive.

## Correspondence.

### SMALL COMPETITIONS: ARE THEY DESIRABLE?

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I was interested to see that the above subject had been opened for discussion in your journal. There can be no doubt that it is very disheartening for architects who have to depend in a great measure upon the work in their own immediate neighbourhood for their livelihood to find that comparatively small competitions are organised for buildings which they could easily and satisfactorily design; but naturally the man who pays is desirous of getting the best that brains and experience will give him, and it seems that "the survival of the fittest" is becoming a reality in every profession.

Of course, it would not be worth the while of a busy architect to devote his valuable time to such small competitions as those under discussion, but there are many young architects who would be only too glad of the chance to show their skill and abilities upon the smaller works which they have the time to execute and sufficient knowledge to grasp.

I believe in the majority of cases that the result of such competitions would show a deeper and more satisfactory study of the requirements than if the work was entrusted to a local practitioner as a matter of course. There are many architects who can date their advancement in their profession to the impetus given to them by the acceptance of such work; and as an encouragement to good, earnest workers, I believe that small competitions are healthy and useful.

But to this I would add that to put small competitions—and large as well—upon a sound basis, it is advisable that they should be entirely conducted by such a journal as THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD. Competitors would then feel sure of considerate treatment; and the criticisms of the examiner could be set forth in the columns of the journal and worthy designs reproduced in the illustrations.

I should very much like to see a portion of your journal devoted to this work, and for the advantage of the younger men I would suggest that in all cases three or four premiums should be offered, and certificates of merit awarded to deserving designers; perhaps it would not be amiss to inaugurate such a scheme by opening a competition for the design of a suitable certificate of merit.

I feel that a great number would be glad to avail themselves of such competitions, the ultimate result of which I believe could only be encouraging and satisfactory to all who wish to do and to see good work.—Yours truly, DEVONIAN.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

19, CRAVEN STREET, W.C.

SIR,—The points in the Architects' Registration Bill to which "H.D." calls attention

in your last issue are all, as he says, open to discussion, and most of them have been very thoroughly discussed already by the framers of the measure, who, without claiming infallibility, have endeavoured to meet these minor difficulties in a reasonable way. There is the question of the annual fee, for instance. Obviously the execution of the Act will cost money, and the way in which this money can easiest and most justly be raised is by a tax—it has been made as light as possible—on those who will benefit by it. And the tax, too, serves another and most important purpose in compelling every person who is on the register to report himself annually for renewal of licence, and so enabling the register to be annually corrected. But for this safeguard, addresses would be lost and the register soon fall into confusion and become valueless. It was the consideration that members of the R.I.B.A. are already taxed, in their subscriptions, and already registered, in their list of members, which led to their being made free from further taxation under the Bill.

So it is with all his contentions. Stating these rapidly, and using his numbering:—(2) Misdemeanour, in a legal sense, is a serious offence, and no registered profession at present constituted will retain on its roll anyone who is proved guilty—the House of Commons would probably introduce a clause were it omitted in the draft. (4) Training is more essential than cram—to ensure proper education and experience is as important as proper examination. There might be reasonable objections raised against the suggested additions to the Council; for architects certainly ought to be able to manage their own business. (5) A much discussed clause, possibly open to amendment when the Bill reaches the Committee stage. Things, too, have altered a good deal since it was drafted. (6) This regulation was adopted almost as it stands from the Medical Act, and, if carefully read, it will be seen that registered foreign and colonial practitioners would be allowed to practise if they complied with certain reasonable requirements. The Isle of Man and the Channel Islands, being self-governing, cannot be included in any Act passed by the English Parliament, and so must be treated as colonies. (7) A suggestion for the Registrar rather than necessarily to be included in the Bill.—Yours, &c.,

G. A. T. MIDDLETON.

**The Memorial Stone was Laid at Northfield** recently of a Wesleyan school. The building will, when complete, provide seating accommodation for 250 scholars, and will cost £1,000, exclusive of the cost of the site and of the furniture, which will add another £600 to the outlay. The stone—a tablet of statuary marble—was laid in the inside of the west wall.

**The Formal Opening of the Maindee Municipal Buildings** took place recently. The buildings have been erected from the plans of Mr. R. H. Haynes, Borough Engineer, at a cost of £5,900, and provide accommodation for the fire brigade, police, and a branch reading-room and lending library. At the rear are sheds for holding the Works and Sanitary Committees' apparatus, also a house for the steam roller.

**A Building Collapsed** recently at North Shields. The scene of the occurrence was an old factory building, which is in course of demolition for building purposes. Without any warning, the front portion of the premises collapsed, and William Marcer, labourer, and his son were buried under the debris. When extricated, the labourer was found to be dead, and his son was badly injured.

**A new English Congregational Chapel**, which has been erected at a cost of £2,000 from the plans of Mr. Roderick, of Aberdare, was recently opened at Abercynon. Mr. W. Games, of Abercynon, was the contractor. The building is Gothic in design and built of local stone, with Forest of Dean stone dressing. Accommodation is provided for 550 worshippers, and beneath is a large school room with accommodation for 400 scholars.

## Views and Reviews.

### THE GROWTH OF GREAT CITIES.

This pamphlet was originally submitted as a paper to the American Academy of Political and Social Science, at Philadelphia, and is written by the president of that society. Exactly what it is intended to convey it is not easy to understand. It starts off with statistics and copious explanatory notes upon the growth of urban population during the past century in Europe and the United States. We are then told that these facts are common-places to intelligent persons, but that it is doubtful whether the general public realizes fully their significance for our social, industrial, and political future. That may be true enough, but before this general ignorance is removed the facts and their significance will have to be expounded with much greater clearness and attractiveness than the author of this pamphlet seems able to command. The pamphlet concludes with a condemnation of the methods of keeping statistical records in various towns. It is conceivable that the statistical expert may find some matter of interest in Mr. James' paper, but to the average man it hardly appeals.

"The Growth of Great Cities in Area and Population: A Study in Municipal Statistics." By Edmund J. James, F.L.D. Price 1s. London: P. S. King and Son, 2, Great Smith Street, Westminster, S.W.

### A BOOK ON ALPHABETS.

Mr. Lewis F. Day's book provides a most useful compendium of lettering which should be of great use to designers. The volume contains over 150 alphabets, of which 100 illustrate ancient examples, reproduced with care to preserve the spirit of the originals. The selection ranges from the earliest period to the eighteenth century, and is arranged in chronological order; there is also a good collection of decorative alphabets by modern artists. Examples are given of alphabets executed in various materials, such as carved in wood, beaten in metal, &c. A variety of lower-case or minuscule alphabets are illustrated, and a series of italic letters. The alphabets have been completed in each case where any of the letters were missing, and thus the practical man is not hampered by omissions that might be demanded by the purist. The architectural side has been considered in providing alphabets by Mr. A. Beresford Pite, J. Cromar Watt, Roland W. Paul, &c. Mr. Lewis F. Day also writes an entertaining account of the development of the alphabet, and furnishes descriptive notes to each illustration. We note that the author intends publishing a book on the use of Lettering in Ornament, which should prove of great interest.

"Alphabets Old and New." By Lewis F. Day. 3s. 6d. nett. London: B. T. Batsford, 94, High Holborn.

### THE RENAISSANCE IN ITALY.

We have already noticed the first volume of "The Renaissance in Italian Art" (by Mr. Selwyn Brinton), which dealt with the art of Pisa, Siena, and Florence, and we now come to Vol. II., which deals in the same way with that of Padua, Verona, Parma, and Venice. As Vol. I. was principally concerned with Florence, so is this with Venice. We find first a prologue devoted to "Humanism and Art," in which the author succeeds in giving us a good idea of the influence of the humanist, and also in giving us a sketch of the life and manners of the times, in which such fascinating figures appear as Lorenzo the Magnificent, Isabella d'Este, Les Battista Alberti, Vittorino da Feltre, and others. This sketch provides the student with that knowledge of the ideals and aspirations of the age without which any complete understanding of the art is impossible.

Chapter I. deals with the School of Squarcione and the rise of Mantegna; then we come to Verona, with the influence of the family of Della Icaia and such artists as Altichiero and Pisanello, and so through Ferrara and Parma to Venice. To Venice are devoted two chap-

ters, one on the making of Venice, and the other called "Venice Enthroned."

We agree with the author that he has effected an improvement by giving an analysis at the end of each sub-division, which analysis, though by no means complete, becomes useful for reference. By doing this, and so clearing his main narrative of much detail, the author considers that he has been enabled "to carry out the true title and purpose of the work, by showing the Renaissance—that whole vast, complex, and yet unended movement of human progress—working in and through the more specialised medium of Italian art." He thinks that to bring "that whole vast movement into vision would have been a task too encyclopaedic for this series," and so has endeavoured to suggest it in broad massing.

This, we think, lays the book open to the criticism that it is neither the one thing nor the other. The Renaissance, as the author says, was a movement that effected not only art, but the whole of life. To treat fully of this movement in its entirety would certainly be a colossal undertaking; but to take up any one aspect of life—social, political, scientific, or artistic—and to trace the manifestation and effect of this movement in that one direction, should not, if done concisely and methodically, be beyond the scope of such a work as this. But to carry out this idea satisfactorily, the Renaissance should be the thing dealt with, the art simply the medium through which it expresses itself. This book, on the contrary, deals more with the art, and as a study of one phase of the Renaissance is lacking in breadth of view, and hardly takes up a sufficiently impersonal or philosophic attitude. On the other hand, it might have been a more complete and valuable handbook for travellers and students, had its scope been more restricted, and had the author's sentiments been more rigorously excluded. The book is neither the work of a scholar, nor that of an artist, and is consequently lacking in both the merits and demerits of such productions, but we have no quarrel with it on that account; taking it on its merits it has interest and value, and it is written with an enthusiasm for the subject with which we sympathise.

We remarked, on the first volume, that the style was not so easy as it might be, and in this volume we occasionally note a certain lack of order and clearness, although, on the whole, the narrative portions read with greater ease and continuity. In the chapter on Venice, we get two pages about Paul Veronese before we have any mention of his name. This, to people who do not already know all about him, is bewildering. The book is well illustrated by fifteen photo reproductions of some of the most famous pictures described, such as "The Sleeping Venus," by Giorgione; "Sacred and Profane Love," by Titian; and "Venice Enthroned," by Veronese. In printing and binding it is quite admirable. A. R. J.

"The Renaissance in Italian Art." Part II. By Selwyn Brinton, M.A. London: Simpkin, Marshall, Hamilton, Kent, and Co. Limited. 1898.

#### A Public Free Library for Grimsby.—

At a meeting of the Grimsby Public Free Library Committee, last week, plans and estimates were accepted for converting the Mechanics' Institute into a free library, at a cost of £1,400 for alterations.

A Memorial was recently unveiled in St. Columba's Church, Knock, to the memory of the late Mr. Thomas Valentine, J.P. The memorial has been designed by Mr. S. P. Close, and executed by Messrs. Craven, Dunville, and Co., of Jackfield, and Messrs. Robinson and Sons, of Belfast. It consists of chancel decoration in encaustic tiles and mosaic, and also red Cork marble steps to the chancel. The tiles are arranged in panels, introducing as ornament examples of Celtic origin, specially prepared for the purpose from the best-known ancient models. The central panel over the communion table has a groundwork of gold mosaic, with ornamentation and text, "Till he come," in coloured mosaic. Over the door leading from the vestry to the church is a brass memorial plate, with a suitable inscription.

NEW SAVINGS BANK, WEST KENSINGTON. HENRY TANNER ARCHITECT.

### NEW POST OFFICE SAVINGS BANK.

THE ceremony of laying the foundation stone of the new Post Office Savings Bank buildings at West Kensington was performed last Saturday by the Prince of Wales, who was accompanied by the Princess, on behalf of the Queen. A pavilion had been erected on the ground to hold over one thousand persons, and it was gaily decorated with flags and festoons. The surrounding streets were also brightly decorated with flags. Among those present in the pavilion were the Duke and Duchess of York, the Duke and Duchess of Connaught, and the Duke of Cambridge. Representing the Queen were the Earl of Pembroke, the Earl of Hopetown, the Duke of Portland, and Colonel Carrington. The others present to receive the Prince were the Duke of Norfolk (Postmaster-General), Sir Matthew White-Ridley, the Duke of Rutland, Lord Esher, the Bishop of London, Sir Spencer Ponsonby Fane, Sir George Murray, Sir Francis Mowatt, Mr. Lang, Mr. Akers Douglas, Mr. Badcock, Mr. Hayes-Fisher, M.P., Mr. Arnold Morley, and Mr. Shaw Lefevre. The Prince on his arrival was much cheered by the crowd. The Duke of Norfolk, the Home Secretary, and the First Commissioner of Works received the Royal party, and conducted them to the marquee. Previous to the laying of the stone, the Duke of Norfolk read an address of welcome, and explained the need of the building. In reply the Prince said, "It gives me sincere pleasure, to be present as the representative of the Queen, my dear mother, to receive your loyal address, and to lay the first stone of the new savings bank buildings. Her Majesty desires me to express the great interest she has always taken in the Post Office Savings Bank, and the gratification with which she has watched the business it transacts attain its present proportion. She rejoices at the stimulus to thrift, commerce, and industry, conferred by a system which has throughout worked so admirably, and reflected the highest credit on those connected with its administration, which while it brings, as you have said, facilities for economy to every man's door, is based on the firmest security. She trusts that the inauguration of these buildings will yet further increase the popularity of the Post Office Savings Bank, and lead to a corresponding benefit to those who invest in this bank, and especially to the working classes. I thank you for your kind expressions towards the Princess of Wales and myself, and for the cordial welcome you have given us." A casket containing coins, a Post-Office Savings Bank book, and other documents was placed beneath the stone by the Prince, to whom a silver trowel, purchased by Post-Office employés, was presented. The Prince spread the cement with the silver trowel and the stone was let down, and when in position the Prince declared it "well and truly laid." After the ceremony the Postmaster-General presented to the Prince the principal officers of his department and the architect.

The new building will be a handsome structure, as will be seen from our illustration, and is to cost over a quarter of a million. Accommodation will be provided for upwards of 4,000 clerks. Attached to the main premises a regular

post-office will be erected. The basement will be used principally for storage purposes and printing offices. The ground, first, second, and third floors will consist of offices and kitchens. The front part of the building will be occupied by the male clerks, and the back part by the female clerks. The engine and boiler rooms, with the electric plant, will be in a separate building at the back of the main building. The building will be constructed on fireproof principles. The interior will be almost completely lined with glazed bricks of various tints. The contractors for the foundations are Messrs. Foster and Dicksee, of Rugby. Mr. Henry Tanner, F.R.I.B.A., of H.M. Office of Works, is the architect.

**Intending Travellers on the Continent** will do well if they apply to Messrs. Pitt and Scott, of 25, Cannon Street, London, E.C., for the little book of useful notes which they will send post free to all applicants. This pocket book is a guide to guides, and contains some very useful hints to travellers.

**New Offices** have been built for Messrs. Cory and Son, shipowners, which have frontages of 70ft. to Mount Stuart Square, and 40ft. to James Street, Cardiff, and a height of 85ft. The architect was Mr. Tudor Thornley. The cost of the building was £6,000. Mr. E. Turner was the builder.

**Penicuik House, Edinburgh**, was destroyed by fire on the 16th inst. The magnificent mural painting by Runciman of the roof of Ossian's Hall was burnt. The building was erected in 1761 under instructions from Sir James Clerk, and was a fine specimen of the purest style of Italian architecture.

**A Building Collapsed** at Hay Hill, Berkeley Street, Piccadilly, W., last week, and buried two men, named Marks and Morris. When they were removed from the debris it was found that Morris had received concussion of the brain and severe internal injuries, and Marks was dead. The building was being demolished.

**New Halls at Arbroath.**—It has been decided to build a small hall and a large hall in connection with the abbey, from designs by Mr. Robert Scott, of Arbroath. The small hall will consist of accommodation for seating 100 persons, a session house, a vestry, and lavatory accommodation. The estimated cost is £600. The large hall will accommodate 600 persons.

**New Hospital at Govan.**—The new hospital recently erected by the Govan Parish Council at Merryflats, Govan, has been formally opened. The main block consists of four double breadth wards, each 95ft. by 24ft., and holding twenty-eight beds, with a frontage of 145ft., and two storeys in height. The approximate cost of the building is £20,000.

**A Fountain** is proposed to be erected in Montrose, to the late Provost Scott. The proposed fountain has been designed by Mr. W. G. Townsend, and could be erected for about £250. The height of the proposed fountain will be 12½ft.; diameter of lower basin, 10ft.; the medallion and tablets for inscription will be of bronze, with angle piece of coloured marble mosaic; the vase-shaped ornament at top will be also of bronze, and the rest of the fountain of good hard stone.

## Bricks and Mortar.

June 28th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### St. Mary-le-Strand.

In connection with our central plates this week the following particulars of the Church of St. Mary-le-Strand may be useful. The church is said to stand upon the site of the ancient Church of St. Ursula, and was built in 1717 by James Gibbs, a Scotchman. It was the first of the fifty churches to be re-erected in Queen Anne's reign after the Great Fire. The building is divided into two heights, externally the Roman Ionic order is employed below, with niches in the intervals between three-quarter columns, while above the wall is pierced by windows, separated by three-quarter columns of the Corinthian order; the whole being surmounted by balustrading and pediments, with vases over three bays (the central one is shown in detail). Internally the walls are similarly divided, but instead of the Ionic order and niches being used in the corresponding position, coupled fluted Corinthian pilasters are employed separating large panels; the windows occupy the upper part of the wall with composite pilasters and panels between them. A reference to the drawing will at once explain this disposition. The interior, as well as the exterior, is of stone, and is painted and gilded throughout, having a somewhat florid appearance. The flat elliptical ceiling, richly moulded and panelled, is a fine specimen of decorative plaster work. The east end of the chancel is terminated by a semi-circular apse, with some boldly modelled plaster decoration on the ceiling. Other distinctive features are the tower (or steeple) over the west end and the entrance porch, the latter being noted for its beauty. This porch is formed by the semicircular projection of the external Ionic order, covered by a flat semi-dome, richly coffered internally, and emphasized externally by radiating ribs of bold projection; it is surmounted by a handsome vase. The tower, a picturesque and elegant design, is remarkable on account of its two lowermost stages being wider across the east and west fronts than on the north and south sides. Externally, the Church of St. Mary-le-Strand is far more elaborate than the majority—if not all—of the smaller classic churches of London, but, as a whole, the edifice is tasteful and beautifully proportioned. Our illustrations are from measured drawings by Mr. J. G. Wiles.

### The Jubilee of the Oldham Corporation.

OLDHAM completed, last Saturday week, the fiftieth year of its existence as a corporate town, and to commemorate the event, the "Oldham Chronicle" issued a jubilee supplement with its ordinary number. This supplement contains a comprehensive review of the work of the Corporation during the past fifty years, and the circumstances attending its formation. It seems that the struggle for the charter was an exciting one, as the town was divided into two parties, the "Charterites" and the

"Ante-Charterites." Finally, however, the "Charterites" gained the day, and the interesting document was received on June 13th, 1849. Since that time the Corporation has been very energetic. In 1890 an electric lighting committee was formed, and soon made use of the "new light." The Corporation are seeking power to extend their works. The Surveyors' Committee was formed on February 13th, 1850. The Sanitary Committee has had plenty of work, and has looked after the sanitary condition of the town very thoroughly. The architecture of the town has improved proportionately, and mention may be made of the fact that in 1879 the Town Hall was enlarged at a cost of £24,000. Mr. Emanuel Whittaker was the only gentleman connected with the building trade who ever held the Mayoralship of Oldham. During his tenour of office, which was in 1873-4, he made practical use of his knowledge to improve the town. He died on October 9th, 1882.

### An Old Oxford House.

ONE of the remaining relics of the Elizabethan age in Oxford in the way of domestic buildings is an old house standing in the High Street, which once did service as a shop, but is now occupied as offices. With its red-tiled roof,

Old House.  
High St  
Oxford.

DRAWN BY G. T. GOOSEY.

its gable, and its imposing bay, it stands among the more modern structures which surround it as evidence of the artistic taste and love of symmetry characteristic of our "rude forefathers." The original lead-glazed windows still remain, and impart to the half-timbered building an air of antiquity and substantiality. It is a fine instance of symmetrical architecture, and it will be noticed how the more massive windows in the first tier are relieved by the central window in the second tier being divided, giving it more grace and lightness than the one beneath it, and preparing the eye for the single window which surmounts the whole.

### The Queen's Pictures.

THERE was much agitation against the removal of a number of pictures from Hampton Court Palace to Kensington Palace, and the Town Clerk of Kingston wrote to Her Majesty's Office of Works, inquiring whether such pictures had been removed permanently or merely temporarily, and also the number of the pictures so removed. To this a reply has been received from the Office of Works stating that the Corporation of Kingston is apparently

not aware that the pictures at Hampton Court Palace are the property of the Sovereign, and are exhibited to the public at the pleasure of Her Majesty, who has exercised her right to add to or withdraw from the collection from time to time, and no question ever had or ever could be raised as to the free exercise of this right. The General Purposes Committee of the Kingston Corporation has informed Her Majesty's Office of Works that its inquiries were not made with any intention to question the rights of Her Majesty in the matter.

### Canning's Statue.

In the House of Lords last Wednesday evening Viscount Sidmouth asked the Government whether they would consider the expediency of removing the statue of Mr. Canning to a more convenient site than that which it at present occupies. In its present position it was almost hidden from view. He suggested that it should be placed on the north side of Westminster Hall, in the garden where the statue of Oliver Cromwell was to be placed. Cromwell was a great man—the most extraordinary man ever heard of in the history of this country. But if there was one thing for which Cromwell was more remarkable than another, it was his overthrow not only of the House of Commons, but also of their lordships' House, and it seemed to him that it would be a ludicrous perversion of history to select that site when there were scores of sites in London where his statue might be placed without offence to anyone. It would be almost as ridiculous to place his statue there as to place a statue of George III. opposite the White House at Washington or to put a statue of Louis XVI. opposite the Elysée in Paris. The site he suggested for the statue of Canning would be close to the place where his fame was acquired, and he would be surrounded by those who had distinguished themselves in both Houses of Parliament.

### All right where it is.

THE Earl of Pembroke admitted that, owing to the growth of trees near it, the statue of Canning was somewhat obscured. The Commissioner of Works had difficulty in finding a better site owing to the size of the statue, it being much larger than any of the other statues of public men in Parliament Square. When the branches of the trees, which now surrounded the statue, had been lopped off, he thought it would show exceedingly well. The Duke of Rutland thought that the site the statue at present occupied had two advantages, one positive and the other negative. A much-frequented road ran in front of the statue, so that everyone passing had a view of it, but no one could see the statue from the rear. It was not expedient that the rear of statues should be brought into prominence. He advised their lordships to "let well alone" in this matter. When the trees about the statue were lopped, he believed the people of London would be quite content with the statue remaining where it was. The subject was then dropped.

### A Liverpool Exhibition.

THE exhibition of the work of the students of the City of Liverpool School of Architecture and Applied Art was opened on Saturday, June 17th, by the Lord Mayor. The school is divided into three departments, consisting of architecture and sculpture, painting and drawing, and decorative design, with which last is associated the craft class. The exhibition is a very interesting one, and the architectural section evidences good study on good lines. There were shown a few working drawings for furniture, which illustrated an interesting development of architectural teaching. The modelling section was much better than at last year's exhibition. Mr. J. H. Morcam treated a design for a font with great boldness, and there was much originality displayed in his work. The wall fountain by Mr. G. Williams was well treated. The studies from the nude evidenced in a few cases a defective knowledge of anatomy. Freedom of line in the use of lead was shown in the specimens of stained glass exhibited. Metal

work appeared to have received the serious attention of many students, and the work exhibited was, on the whole, good. There were also some notable exhibits in wrought iron, stencelling, painted textiles, and other decorative media.

#### Finds in the Forum.

The excavations in the Roman Forum continue to yield interesting results. The western and southern walls of the Regia, or chapter house of the Pontifices, have been laid bare. They are Republican in style, and are built of tufa. The walls differ very much from one another in the varieties of tufa employed, and in the measurements of their blocks. The south wall is composed of blocks uniformly 1ft. 5in. in vertical thickness, and the blocks forming the west wall are 1ft. 10in., and the workmanship is better. This wall was probably built by Domitius Calvinus after the fire of 36 B.C. Within the western wall a fine cement-lined cistern has been found, which resembles very much the one found on the Palatine about fifteen months ago. The diameter of this one discovered in the Regia is 10ft., and in the mud, which was ladled out of it, was found plenty of pottery. On Wednesday the excavators discovered the top of a magnificent column of Phrygian marble, 4ft. thick. It is believed to form part of the original structure of the basilica. The whole of the excavations are being carried out in a very careful manner, and every stone, every brick, is being carefully scrutinised.

#### Colchester's New Town Hall.

We have received a history of the new Town Hall and municipal buildings for Colchester from the authors, Mr. Wilson Marriage and Mr. W. Gurney Benham. It will be remembered that Mr. John Belcher, F.R.I.B.A., was the architect, and Messrs. Kerridge and Shaw, of Cambridge, secured the contract, which was for £33,397. In connection with the building of the Town Hall the Town Council have, from the first, tried to make it as artistically interesting as possible. Their aim should be more imitated by other municipalities. The Council have been singularly fortunate in having been promised many gifts towards beautifying their assembly house. Many stained-glass windows have been promised, and Alderman Green, J.P., is giving a statue of the Queen. A full-length statue in marble of Endo Dapifer, founder of Colchester Castle, of St. John's Abbey, and reputed builder of the old Moot Hall, is to be placed on the High Street façade, and is the gift of Councillor Watts, J.P. Several other statues are being given. The Council are not backward in stating their wants, and in this book is given a list of gifts which they suggest would be useful in the decoration of the buildings.

#### Proposed Gallery at the South Kensington Museum.

In the House of Commons last week the subject of the proposed gallery across the quadrangle, known as Museum Square, came up for discussion. Captain Norton asked the First Commissioner whether it had been brought to his notice that the proposed gallery would greatly detract from the architectural beauty of the buildings; and whether, before proceeding further with the proposed alteration, he would consult with other authorities on architecture as to the effect which this gallery would have on the general appearance of the quadrangle.—Mr. Akers Douglas replied that it was not intended to proceed with the gallery at once, and he should be guided ultimately in regard to its construction by the advice of the Committee of Architects, who were assisting him with the designs.

#### "The Irish Builder."

OUR old-established contemporary, the "Irish Builder," is now under new management. The paper has been in existence for close on half a century, and for the last forty years has been owned and most ably edited by Mr. Peter Roe. Mr. Roe has now been compelled by advancing years to sever his active con-

nection with the paper. Our contemporary was established in 1850 by Mr. Lyons, an architect well known in his day, and the present management have decided upon enlarging and improving it. The paper in its improved form proposes to deal not only with building, but the kindred arts and crafts—the fine arts generally, electric lighting, the antiquities of Ireland, native industries, &c. We heartily wish all success to this new venture, which supplies the wants of the members of the profession in Ireland. Nothing much up to the present has been heard of the smaller buildings put up in Ireland; we hear of the churches built there, but that is about all. We hope this journal will supply such news, for anything calculated to arouse further interest in domestic architecture deserves success.

#### Archæological Discovery in New Mexico.

DURING recent excavations among the lava beds of New Mexico, tracks of ditches and reservoirs, forming part of an elaborate irrigation system of very great antiquity, have been found, the work being declared by the superintending

## Professional Practice.

**Abertillery.**—The Lord Bishop of Llandaff consecrated the new church of St. Michael on June 19th. The new building will seat 750. The style is late thirteenth century, and the plan comprises nave, aisles, tower, chancel, large vestries, with organ chamber over, and heating apparatus under, and a morning chapel on the south side. The walls are of local stone with Bath stone dressings, and the interior is of Ebbw Vale buff bricks with Bath stone caps, &c. The stained glass windows are from the studio of Messrs. A. Savell, of London. The church has been built by Councillor A. P. Williams, of Abertillery, from plans and under the supervision of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The building is lofty and of good outline, the height from the floor to the apex of the roof being 54ft. 6in.

**Beeston.**—The opening ceremony of the new Union Church was performed last Tuesday week. The church has been built to accomo-

BAPTIST CHURCH AT BULTH WELLS, WALES. GEORGE MORGAN AND SON, ARCHITECTS.

engineers to be superior to the most modern of its kind. The ditches, which are lined with cement, follow with geometrical perfection the basal wending of the mountains round which they pass. They are carried across chasms and depressions by means of viaducts in such a skilful manner that they must have drained off from the mountains practically every drop of surface water, which will then be carried into the basin constructed at convenient intervals, and distributed thence in every direction to distant and arid valleys. Not only are the basins on such a scale as to warrant the belief that they would furnish water throughout the longest periods of drought, but they were so constructed as to provide for the collection of silt and its utilisation as a fertiliser. The whole system shows the possession by its creators of the highest engineering skill.

date about 400 persons. The architecture is of the Perpendicular period, and the main front is of Bulwell stone, rock faced with dressings of Coxbench stone, whilst the roof is tiled with American sea-green slates. The benches for the congregation are of Columbian pine, and the materials of the rostrum are pitch pine and mahogany, which are decorated with finely articulated iron scroll work. In front of the rostrum is situated the baptistry, let in 3ft. 6in. below the floor of the chapel, and lined with white glazed bricks. At the rear are the ministers' and the choir vestries, kitchen, and a large schoolroom, 51ft. long by 18ft. wide. The edifice is 66ft. long, 36ft. wide, and 37ft. from the floor to the ridge. Mr. C. N. Holloway, of Newcastle Chambers, Nottingham, is the architect, and Mr. W. Turner, of Beeston, is the contractor. The building and site cost £2,684.

**Birmingham.**—Christ Church is almost entirely demolished, and three blocks of commercial buildings are to be erected on the site, which is 2,475 square yards. The plans of Messrs. Essex, Nicol, and Goodman show that the first portion of the buildings covers about half of the site. Messrs. J. Barnsley and Sons, of Kyland Street, secured the contract for this part, the cost being about £50,000. The first block of buildings will be in New Street, the second in Colmore Row, and the third in Christ Church Passage. The frontage to Colmore Row will have a complete façade, and four shops on either side of the office entrance. The division walls of the shops will be removable. Each shop will be provided with basements and sub-basements with an approach from Christ Church Passage for the admission of goods, &c. Above the shops will be four stories of offices with several strong rooms. On the top floor will be the caretaker's apartments. In order to provide security in the event of fire, each of the staircases has an outside gangway up to the top floor level. On each side of the central office entrance in Colmore Row, facing the Council House, there will be a large double-fronted shop, and a three-story bay window above, the whole being surmounted by an ornate gable. The flanks of the building will have a bay window at the second floor level, and smaller gables; the intermediate portions of the front will have two-story bay windows, with perforated balconies over, connected to an arcaded story at the third floor level, and ornamental stone dormers in the roof. Darley Dale stone will be used for the ground floor story, relieved with pilasters of red granite. The remainder of the building will be faced with Monks Park Bath stone. The roofs will be covered with green Westmoreland slates. The general style adopted is a free form of Renaissance. The block facing Waterloo Street will harmonise in general character with the Colmore Row one, with the exception that the ground floor story will have a heavier treatment, more suitable for professional offices. There will be a complete façade from the corner of Colmore Row to the central point facing Temple Row, in which the office entrance will be situated, so that when the building is approached from Temple Row this circular portion would also present a symmetrical front, and it will be finished with a dome. This façade will have gables at either end, and bay windows similar to the treatment in Colmore Row. The intermediate portions will have four bay windows, divided by double pilasters, running from the first and second storeys. Above will be an ornamental perforated balcony, an arcaded storey, and four ornamental stone dormers in the roof.

**Builth Wells, Wales.**—The illustration on the previous page is of a Baptist church, which has just been erected at Builth Wells, as a memorial of the Queen's Diamond Jubilee. The new chapel is built on a site, costing £540, facing the parish church. Messrs. George Morgan and Son, of 24, King Street, Carmarthen, are the architects, and Mr. Henry Price, of Builth, contracted to erect the edifice for £2,250. The design follows the Early English style of architecture, and is therefore solid and simple rather than florid and ornate. Yet, constructed of Llanelwedd stone, with Bath stone dressings, and one of the front angles turreted, it has a quasi-ecclesiastical appearance, and both the front and sides being open to the road it forms a handsome addition to the public buildings of the town. The internal arrangements are planned on the most approved lines of modern chapels. There is a central hall with two wings at the upper end, corresponding respectively to the nave and transepts in cathedrals and churches. Down the body of the building are two aisles, and the benches are arranged in three main divisions—in the centre and at the sides. The transepts, of course, are similarly benched. A fine rostrum or pulpit projects from under a lofty arch at the principal end, and is in full view of the whole congregation. Within the archway are two vestries, one on either side. The baptistry is situated on the rostrum; this admits of the

rite being fully witnessed and at the same time gives the candidates ready access to the vestries. Over the entrance porch there is a commodious gallery, and the building is so constructed as to allow of the erection of side galleries whenever occasion calls for them. At the same time provision is made for the building at some future time of a schoolroom at the rear of the pulpit, divided from the chapel by sliding doors, which, with the side galleries, would raise the seating accommodation from 450, as at present, to at least 650. The building is lofty, with open-timbered roof, and is also well lighted, the windows being glazed with cathedral glass fixed with rolled lead. The gas standards are of brass. Mr. W. E. Dixon, of Builth, carried out the painting, &c., of the chapel.

**Clacton-on-Sea.**—The Passmore-Edwards Holiday Home for Children, which has cost about £10,000, was opened on June 15th. The site which the Home occupies is extreme east of Clacton, and faces due south. It consists of an acre and three-quarters, standing 150ft. back from the cliff and fronting the sea. The cost of the ground was £1,000. Accommodation will be provided for forty boys and forty girls, or, if necessary, one hundred children in all. The building will admit of extension in the future, so that there would then be sleeping room for fifty more. It is of red brick, with half-timbered stucco gables, a prominent square tower, and a ground verandah. On the ground floor is a fine hall, 90ft. long, divided

**Leeds.**—A Congregational Church is to be built in Harehills Road, at an estimated cost of £2,500, from designs by Mr. T. Dyer, of Albion Street, Leeds. The church is planned to seat 750 persons. It will have a nave and transepts, and there will be a gallery at the end over the main entrance. Vestries for the pastor and choir, and ladies' and gentlemen's cloak-rooms will be provided. The spacious entrances are provided with inner lobbies. Internally, the walls will be plastered and decorated, the roofs open-timbered, and the woodwork throughout of pitch pine, stained and varnished. The building will be of brick, with stone dressings, and the tower will rise to a height of about 100ft. The windows will be filled with tinted glass.

**Liverpool.**—The memorial stone of the Ullet Road Unitarian Church was unveiled on Monday, last week, by Sir John Brunner. The new church has been built externally of Runcorn stone and Ruabon brick; internally it is completely lined with Runcorn stone. The church is entered through a large vestibule, and consists of a wide nave, which contains seating accommodation for 440 persons, and a chancel with a semi-octagonal terminal and organ chamber. At the west end, above the vestibule, there rises a gable crowned by a belfry, and containing a rose window filled with stained glass, and above this, in the broad hollow of the arch, is an angel holding a scroll. A projection on the north side towards Cheltenham Avenue is the organ chamber, and the low buildings on the south side contain

HOLIDAY HOME FOR CHILDREN, CLACTON-ON-SEA. THE LATE CHARLES BELL, ARCHITECT.

by sliding panels. One portion will be used as the dining-room and the other as a play-room. On the left-hand side are the matron's room, visitors' reception-room, and a sitting-room for the elder girls. The first floor comprises the boys' dormitories and the matron's and the officers' bedrooms, and on the second floor are the sleeping apartments for the girls and the assistant-matron's room. Each floor is provided with lavatories and bathrooms. A spacious playground is provided at the back of the building, and in front is a wide space of garden ground. The architect was the late Mr. Charles Bell, F.R.I.B.A.

**Dover.**—In the recent competition for designs for a concert pavilion to be erected on Dover Promenade Pier, the directors have selected the joint design of M. Noel Ridley, A.M.I.C.E., and Robert J. Beale, A.R.I.B.A., of Westminster, who for many years have had considerable experience in pier structures and buildings. The directors have also adopted a report by the same authors on the strengthening of the pier, and given instructions for the working, drawings, &c., to be at once proceeded with.

vestries and a congregational hall. The latter will eventually be used as a library when the adjoining buildings are completed. These last-named buildings will comprise a congregational hall with accommodation for Sunday schools, and will fill three sides of a quadrangle, leaving the fourth open towards the south or Ullet Road boundary. Messrs. Earp and Hobbs, of London and Manchester, have executed the carving work in stone and a portion of the woodwork. The architects are Messrs. Thomas Worthington and Son, Manchester; the contractors, Messrs. W. Tomkinson and Son, Liverpool; and Mr. J. Clydesdale has acted as clerk of works. Proceeding to the main west door, and those of the north and south porches, the effective works by Mr. R. L. B. Rathbone in beaten copper are particularly worthy of mention. The windows of the church have been designed by Messrs. William Morris and Co. and Sir E. Burne-Jones. The oak work in the interior of the building has been executed from the architect's designs by Messrs. Hatch and Sons, of Lancaster. The carved panel in the reredos is a reproduction in oak of Leonardo da Vinci's fresco of the Last Supper, and has

been executed by Mr. H. H. Martyn, of Cheltenham. The organ has been built by Messrs. Hill and Sons. Mr. Gerald Moira has been commissioned by Sir John Brunner to carry out the decorative work of the vestries and the congregational hall. The iron railings and the gates have been made by Mr. George Wragge from designs by the architect. The entire cost of the church is estimated at £25,000.

**Malone.**—The opening services in connection with the new Presbyterian Church at Malone were performed on June 18th. The church consists of a nave and aisles, with large projecting transepts, and includes a spacious gallery, approached by two staircases from the vestibule, the whole being planned to accommodate more than 1,000 persons. Prominence is given to the main doorway, which has octagon shafts, with moulded bases and caps, carrying a Tudor arch richly moulded and carved. Angular buttresses are placed at each side of the jambs, surmounted by moulded battlements. The main gable contains two large tracery windows, embraced by a relieving arch, with label moulding, having carved bosses and apex. Above the latter rises an angular finial. A massive buttressed tower with a deeply-recessed doorway is placed at the south-west angle of the church; it is pierced by tracery belfry windows, and is crowned by a well-proportioned stone spire, which terminates in a gilt copper weathervane at a height of 125ft. At the opposite angle is an octagonal projecting staircase with angle buttresses and a doorway between them. All the windows have cusped tracery heads in the Tudor style, those in the transepts being of large size. All the gables are coped with moulded stones, and the roofs are covered with green Westmoreland slates. The walling is of selected Scrabo sandstone, with mullions of Giffnock stone. A portion of the front is divided by a flying buttress with novel effect. All the internal joinery is of selected pitch and yellow pine, with Carolina sheeting for the roof and wall dadoes. A series of richly-moulded Tudor arches divides the nave from the aisles. Three painted memorial windows have been placed in the rear gable. The circular window, which is in the centre of the gable, represents the emblem of the "burning bush," and the motto beneath it is "Ardens sed virens." The tracery round this is filled with a conventional treatment of the "lily" and "passion flower." The two windows in the transepts are filled with stained glass in "Gressaille" pattern of rich colouring, through which are introduced Biblical plants. The windows were designed and made by Messrs. Ward and Partners, of Belfast. Messrs. Riddle and Co. have erected the entrance gates and lamps. The vestibule is laid with marble terrazzo by Messrs. J. and F. Ebner, of London; while the general contractors for the work are Messrs. Courtney and Co., who have carried out the whole contract under the supervision of the architects, Messrs. Young and Mackenzie.

**Redditch.**—The opening of the new police station, erected by the Worcester County Council, took place last week. On October 2, 1897, the work was entrusted to Messrs. C. G. Huins and Sons, of Redditch. The new buildings are erected on a site containing about 2,000 square yards, with a frontage of 167ft. The premises comprise an inspector's house, sergeant's house, an administrative block with charge-rooms, men's messroom and kitchen, and dormitory divided into cubicles for four unmarried constables. There are five cells. The sessions-room, which is divided from the administrative block by a drive, is 45ft. by 25ft. It has an opened timbered roof. There is a magistrates' retiring room, special room for witnesses in waiting, and a solicitors' room. The out-offices consist of weights-and-measures room, men's cleaning-room, and coach-house and stabling for two horses. There is also a spacious parade ground. The building is fitted throughout with the electric light. The front elevation consists of red bricks of Ruabon manufacture, with dressings of white stone. The approximate cost of the building, including site and furniture, is about £7,000.

**Stratford.**—On Monday, last week, the ancient Parish Church of Bow was re-opened by the Bishop of London. In 1896 the church had to be closed on account of its dangerous condition, and a proposal was made at the time that it should be pulled down. This proposal was, fortunately, not carried out. In the chancel the gable roof has been renewed, and the brick gable rebuilt. The fifteenth century roof, as seen from the interior, remains unaltered. The walls have been rejointed with tiles and flints, and some new Portland stone has been inserted. In connection with the nave practically a new roof has been provided, although some of the old timbers have been re-used. Double oak windows have been added to deaden the sound of the heavy traffic which passes within a few feet of the church windows. In the north aisle a new doorway to the modern vestry has been placed, and the wall has been repaired like the chancel. The old red brick vestry has been extended to embrace a choir vestry and entrance lobby. The tower of the church has still to be repaired. About £3,700 has been spent, and £1,000 will be required for the tower. Messrs. Walter A. Hills and Son were the architects.

**Wallasey.**—The memorial stone of a new Presbyterian church was laid by Mr. S. Smith, M.P., on Monday last week. The building, when completed, will consist of nave and transepts, minister's vestry, ladies' retiring room, &c., and arrangements have been made whereby a west gallery can be erected at a future period should this be found desirable or necessary, space for an independent entrance to the stairway being provided in the turret of the porch structure. The style of architecture adopted is early Gothic. The building will be faced on all sides with Ruabon brick, the dressings and ornamental tracery, strings, and weatherings being of terra-cotta. The windows will be glazed with cathedral glass, the internal fittings and pew framing will be of varnished pitch pine, and the roofs will be covered with Ruabon red tiles. According to the present scheme, there will be accommodation for about 450 worshippers. The chief entrance to the church is by an open portico in the centre of the main facade, the vestry and retiring rooms having approaches from the side street. The estimated cost of the building is about £4,000, including the sum which was paid for the site. The architect is Mr. A. W. Smith, of Manchester, and the contractor Mr. W. H. Forde, of Birkenhead.

**The New County Hospital at Bedford** was opened last week by the Duke of Bedford. The cost of the hospital is £38,000; the architect was Mr. H. Percy Adams, and the contractors were Messrs. Kerridge and Shaw, of Cambridge.

**Church Built by Vicar and Congregation.**—The new church of St. Aidan's, Middlesbrough, was dedicated by the Archbishop of York recently. The church is built entirely of wood, and the labour in connection with its erection was performed by voluntary workers. The Rev. C. H. Sellwood Godwin having dug the foundations himself, appealed to the people of the town for help, and within a few weeks about eighty workmen were helping him. The length of the edifice is 102ft., width 40ft., and height 45ft. There is sitting accommodation for nearly 600 people, and the cost of the erection of the building is between £1,500 and £2,000.

**Dispute about Smoke Prevention Appliances.**—At Halifax last Wednesday, before Judge Cadman, Messrs. Coombs, Pearson, and Co., Manchester, claimed from Messrs. Ingham Bros., Washer Lane Dyeworks, Halifax, £60 for two sets of smoke preventing appliances. The plaintiffs' case was that in August last two smoke preventing appliances were ordered on the understanding that if, after a month's free trial, they gave satisfaction, they should be paid for. In defence, it was alleged that although the appliances prevented smoke, they caused the temperature of the singeing room to go down, and were useless. His honour gave a verdict for the defendants.

## Keystones.

**The New Infectious Diseases Hospital for Kirkcaldy**, the cost of which was about £10,000, was opened last week.

**Mr. W. E. Barry, A.R.I.B.A.**, has moved to more convenient offices at Hunter Chambers, Huntriss Row, Scarborough.

**Broom Bridge Scheme.**—The Alcester Rural District Council have resolved to borrow £700 towards erecting a bridge at Broom.

**Alterations at Higbury Relief Office** are to be carried out from the designs by Mr. W. Smith, of 65, Chancery Lane, London, W.

**A Free Church at Elderslie** is to be erected at a cost of £1,850; the memorial stone was laid by Sir Thomas Glen Coats last week.

**The Kensington Dispensary** is to be rebuilt from the designs by Mr. Gordon Statham, of 100b, Queen Victoria Street, London, E.C.

**New Catholic Schools at Bloxwich.** The foundation stone of a new school, which will cost £2,300, for St. Patrick's Catholic Church, was laid on Monday, last week.

**A New Church at Streatham.**—The foundation stone of the Church of St. Margaret, was laid by the Bishop of Southwark last week. The new building will cost £8,000.

**Infirmary and Probation Cottages** are to be built at Southall Poor Law Schools from designs by Mr. A. Saxon Snell, of 22, Southampton Buildings, Chancery Lane, London, W.C.

**The Foundation Stones of a Baptist Chapel in King Street, Loughborough**, were laid recently. Messrs. Main and Kendall are the builders, and the total cost of the land and building is about £1,000.

**The Unveiling of a Statue of Velasquez** took place in Madrid recently, and was performed by the Queen Regent. Among the representative artists of various countries present was Sir Edward Poynter, P.R.A.

**Arts and Crafts Exhibition at Oldham.**—It has been decided by the Free Library and Art Gallery Committee of the Oldham Corporation to hold an arts and crafts exhibition during four weeks in September next.

**The Society of Arts Conversazione** was held at the Natural History Museum, South Kensington, last Tuesday week. The number numbered over 2000 and were received by J. Wolfe Barry, and members of the Council.

**The Erection of Cottages in Broom Street, Limehouse**, is to be carried out at a cost of £4,423. The tender for this amount proffered by Messrs. Leslie and Co., was accepted by the London County Council at their meeting last week.

**New Premises in Cannon Street, London, E.C.**, have been erected from designs by Mr. Huntley-Gordon, F.R.I.B.A., of 123, Cannon Street. The new building is built of red brick and Portland stone standing on a plinth of Labrador granite.

**The Foundation-stone of the new North Church, Stone**, was laid last Tuesday week. The nave of the old church has been taken down, and a new one is about to be erected with an extension which will accommodate 200 more persons; the cost of the building will be about £3,000.

**An Offer to Hampstead.**—An anonymous gentleman has promised £3,500 for the purpose of erecting a Municipal Museum and Gallery adjoining the Central Free Public Library at Hampstead. The offer is received with the consideration of the Libraries Committee of the Hampstead Vestry.

**Improvements at St. Martin's-le-Grand.**—The extensive structural alterations and additions to the cloak and dining room at the Central Telegraph Office, at St. Martin's-le-Grand, which have involved an outlay of £50,000, are almost finished. New dining rooms of large dimensions have been added to the old premises in Roman Bath Street, and in their turn are enlarged by an extra storey.

**A New Town Hall for Kirton Lindsey** has been erected in commemoration of the Diamond Jubilee. The building is of stone, and has been erected from plans by Mr. J. K. Broughton, who was also responsible for the woodwork. The stonework was undertaken by Mr. E. Hollome, and the plumbing by Mr. Sims, of Kinton, and Mr. Tall, of Gainsborough.

**Building at Glasgow.**—Permission has just been granted at Glasgow Dean of Guild Court for the erection of property of the value of £150,000. Hutchesons' Hospital Incorporation have received authority to form a public street off Butterbiggins Road, and the Caledonian Railway Company to erect buildings and offices at the corner of London Street and Saltmarket.

**The Roman Catholic Cathedral** in Ashley Place, Westminster, is so far advanced towards completion that Cardinal Vaughan is inviting suggestions as to the subjects for its internal ornamentation and decoration. Marble and mosaics will be the main materials used. The Byzantine style of the edifice renders this almost obligatory. The architect of the cathedral is Mr. J. F. Bentley, and the contractors are Messrs. Shiltoe, of Bury St. Edmunds.

## New Companies.

### Albert Jubb and Sons, Limited.

This company was registered on June 12th, by Waterlow and Sons, Limited, of London Wall, London, E.C., with a capital of £5,000 in £1 shares. Its object is to carry on the business of painters, decorators, builders, &c., and it was registered without articles of association. Registered office: 151, Fitzwilliam Street, Sheffield.

### John Stather and Sons, Limited.

This company was registered on June 12th, by Waterloo and Sons, of London Wall, E.C., with a capital of £12,000 in £10 shares. Its object is to acquire the business carried on as John Stather and Sons, at Kingston-upon-Hull, and to carry on the business of paper-hangings manufacturers, paper stainers and merchants, &c. Thomas Stather and John W. Stather are the first directors. Remuneration as fixed by the company.

### Humber Brick and Tile Company, Ltd.

This company was registered on June 12th, by Jordan and Sons, Limited, 120, Chancery Lane, London, W.C., with a capital of £5,000, in £1 shares. Its object is to acquire and carry on the business carried on by Edward S. Annison at New Holland, Lincolnshire, as the Humber Brick and Tile Works, and at Holderness Road, Kingston-upon-Hull, as E. S. Annison. The first directors—to number not less than two nor more than five—are E. S. Annison and J. W. Gibson. Qualification, £50. Remuneration, £20 each per annum.

### W. H. Aston, Worcester, Ltd.

This company was registered on June 12th, by Waterlow and Sons, Limited, of London Wall, London, E.C., with a capital of £10,000, in £10 shares. Its object is to acquire the business carried on at Jubilee Works, Vincent Road, Worcester, by Walter H. Aston, and to carry on the business of timber, wood, brick, and coal merchants. The first directors—to number not less than two nor more than four—are Walter H. Aston and Harry A. Caink. Qualification, £200. Remuneration as fixed by the company.

### Durron Brick and Tile Works, Limited.

This company was registered in Ireland on June 10th, by Molloy and Molloy, solicitors, of Dublin, with a capital of £30,000 in £1 shares, for the purpose of acquiring and taking over the established brick and tile factory known as the Durren Brick and Tile Works, Durren, Queens County, and for this purpose to enter into and carry into effect an agreement made between the Irish Industries Development

Syndicate, Limited, and the company. Directors to be not less than three nor more than six. The first subscribers (each one share) are Messrs. A. L. Smith, H. Carleton, J. T. Furlong, E. Osborne, W. G. Didley, W. A. Pike, and J. St. Laurence.

### Portman Estate Mansions, Limited.

This company was registered on June 10th by Ashurst and Co., of 17, Throgmorton Avenue, E.C., with a capital of £170,000 in 8,500 preferred and 8,500 ordinary shares of £10 each. Its object is to adopt and carry into effect an agreement expressed to be made between A. F. Pennel of the one part and this company of the other part, for the acquisition by purchase or otherwise of any lands, buildings, and other property of whatever tenure or description, situated in the City or county of London; to prepare building sites; to build houses, flats, offices, warehouses, shops, wharves, buildings, works, and conveniences of all kinds; as builders and contractors, decorators, merchants, and dealers in stone, sand, lime, bricks, timber, hardware, and other building requisites, brick, tile, and terra-cotta makers, jobmasters, carriers, hotel and club proprietors, licensed victuallers, house agents, &c. The first signatories (each one share) are Messrs. A. W. Lawson, E. T. Church, E. L. Harper, J. M. Lickfold, H. W. Brown, A. J. Swan, and S. A. Tyabjee. The first directors—of whom there shall be not less than three nor more than seven—are Hon. E. B. Portman, A. A. Baumann, H. G. H. Norman, and C. G. Pym. Qualification, £250. Remuneration, £100 per annum each, with a percentage of the profits, divisible.

# HEATING AND VENTILATION.\*

By WALTER JONES.

LET us for a few moments take a brief survey of the progress made in the heating and ventilating trades, and ascertain if possible whether individually or collectively we are doing all that can be done to promote their highest and best interests. At the beginning of the century very little was known of the science of heating by hot water: twenty-five years ago heating engineers were few and far between, to-day you can scarcely go through a small town or village without coming across a sign "Plumber and Hot Water Fitter" or "Ironmonger and Heating Engineer." I believe the first treatise that made any pretensions to dealing with the subject in a comprehensive manner, was the one written by Chas. Hood, F.R.A.S., and published in 1837. In the preface to this book Mr. Hood says:—"Finding that nothing relating to the invention had hitherto been published, it appeared probable that the materials I possessed might form a treatise which would be useful, not only in showing the practical application of the invention, but also in explaining the scientific principles upon which the various effects depend, the whole comprising, it is hoped, all the information which the subject requires."

The heating engineers of to-day are indebted to Mr. Chas. Hood for his excellent treatise, and although we must all feel, and if Mr. Hood were living to-day I think he would admit, that it did not contain all the information which the subject requires, it was a valuable work, especially when we consider the date of its publication. With all its merits, this book, like all others, was not without its faults, and the data, tables, and information as to the proportions of boiler surface, and pipe surface required to give certain results have led to untold failures.

Mr. Hood's book treats principally with the low-pressure system, and in the same year, 1837, a book on the high-pressure system, written by Mr. C. J. Richardson, was also published.

Its literary matter describes the details, and the illustrations show the adaptation of the Perkins' system, with sealed tubes as used for heating and ventilating purposes, and on looking carefully through this book, and another one published in 1840, entitled "A. M. Perkins' Patent Apparatus for Warming and Ventilating Buildings," one is surprised to find how closely the system of to-day resembles that adopted sixty years ago. The improvements during that time are comparatively slight, and bear no comparison with the enormous strides made in low-pressure heating during the same period.

Fifteen years ago a manufacturer of heating apparatus said to me: "I think the hot-water trade is about played out." "Played out!" I replied. "Why, the hot-water trade is in its infancy, we have scarcely started yet." And I tell you, gentlemen, that although much has been done during the past fifteen years, you have scarcely touched the fringe yet; so long as ninety-nine houses out of every hundred are without heating apparatus, how can it be played out? What we have to do to-day is to educate the public, show them the advantage, the economy, and the necessity of artificial heating, that for any building and for every building there is nothing to compare with it; there is ample scope for you all in this direction. The colder climate of America creates the necessity, but the damp, humid, and changeable conditions of the English climate from October to April are far more treacherous and more trying to the constitution than the sharp, dry atmosphere in colder regions. Instil this fact into the minds of the people, convince them that they are court-

ing sickness and shortening their lives, and the heating engineers will not want for employment. In confirmation of this opinion about the climatic conditions, note the following extract from the "Wide World Magazine," September, 1898, page 572, on "The National Pastime of Norway;" it says:—"Fifteen degrees below zero is not at all an uncommon experience in Norway in midwinter: and this, be it remembered, means 47deg. of cold. This sounds terrible to an English mind; indeed, most persons shudder when they hear it. Nevertheless, strange as the statement may seem, the cold mentioned is not so cutting as that of an ordinary winter's day in dear old England."

I have frequently heard this opinion confirmed by Americans and Canadians that they have felt the cold keener, and suffered greater inconvenience in England, with a temperature of 32 degrees than they have in their own country with a registered temperature of 50 to 60 degrees lower. We have abundance of medical testimony as to the augmented sickness and the increased death rate for lack of proper hygienic conditions.

The architects also require educating in this direction. They often spend large sums of money in ornamentation and decoration, and cut down the cost for that which is of far greater importance, the comfort and health of the owner or occupier. I have known hundreds of instances where lavish expenditure has been made in less important matters, and the amount provided for heating has been simply ridiculous, so that success has been impossible; the result is that the heating engineers get the discredit, and the apparatus has been pronounced a failure in consequence.

If the architects fail in their duty, we must educate the public so that they will insist upon their architects making ample provision for heating and ventilation; the demand will be simply enormous. The sphere of work is limited only by the circumference of the earth, and if this institution is true to its name, the developments of the near future cannot be estimated.

I should like to indicate what may be considered some of the chief wants of the trade, and if some of my remarks should appear critical or severe, I assure you they are not given for the purpose of finding fault, but with an earnest desire to arrive at the truth. I should say that we need

First: A good reliable standard work on heating by hot water, in which the data has been corrected, new tables added to meet diversified and special needs, existing tables revised and verified, the latest and most improved methods introduced and brought up to date.

Second: A good English weekly or monthly periodical, devoted exclusively to the interests of the heating and ventilating trades.

Third: That a code of rules should be prepared and adopted to safeguard the interests of the trade, and that steps should be taken to insure fair treatment, and to prevent exploitation.

Fourth: That the members of this institution should work together, assist each other, and not stoop to the meanness of taking an unfair advantage of other members of the trade.

We will consider these four points seriatim.

First: The want of a reliable standard work. In consulting a number of different books I find that one author says:—

That iron melts at 2,200deg. Fah. Another says the melting point is 20,577 deg. Fah.

That gold melts at 2,200deg. Fah. Another says 5,237deg. Fah.

	Another
One puts the conducting power of gold at 100	53
" " " " silver	53
" " " " iron	11
" " " " gold	12
" " " " silver	12
" " " " iron	15

One book says one h.-p. steam boiler will heat 5000 cubic feet, another says 20,000 cubic feet, and another says 50,000 cubic feet of space.

One author gives a rule that provides 36ft.

of radiation to obtain a given temperature, and gives a table in the same book that says 180ft. are required to give the same result.

Four separate authors give rules or tables for obtaining given temperatures, that when worked out give 48ft., 118ft., 237ft., and 300ft. respectively to obtain the same result.

Well, gentlemen, I do not know what you think, but it is clear that all these authorities cannot be right, and perhaps they are all wrong, with diversified opinions and such a want of unanimity the marvel is that we do not get a much larger percentage of failures in our heating plants. I don't know whether any of you have observed these discrepancies, but I could give scores of instances similar to those mentioned. I sometimes wonder whether other engineers get asked such questions as are put to me. Take the following examples and note the entire absence of any data upon which to base any calculation:

What would it cost to heat a church? and could it be done by gas?

How would you warm a swimming bath, and what would be the expense?

Which is the best way to connect up a radiator?

Quote price of cheap heating apparatus, give detailed prices with 2in. and 4in. pipes.

Please quote price for two coils (hot water or steam) for a room 20ft. square, also for a room 33ft. by 27ft.

Quote for boiler of sufficient heating capacity to supply not less than 100 gallons of water at 212deg. Fah. per hour, giving a guarantee to this effect, and the amount of fuel required, three months free trial, during which time if boiler is found incapable of keeping up the supply, to be returned carriage forward and no claim allowed for use during that period.

The above are copies of inquiries received during the past few months.

There is a book published that is looked upon as a standard work, both in America and England, which says:—

"For hot water, a building will require a ratio of pipe surface of from '70 to '85 to one foot of glass to maintain 70deg. Fah. by direct radiation."

Now, if this rule is correct when applied to a window with 20ft. of glass, it ought to be equally correct if applied to a greenhouse with 200 or 2000ft. of glass, but if you apply this test to a small greenhouse 10ft. long by 8ft. wide, with, say, 200ft. super. of glass, it gives 155ft. super. of radiation for a temperature of 70deg. Fah.

Now, I have no hesitation in stating that one-third this amount of pipe surface will maintain the temperature above mentioned. The greater the difference between the temperature of the pipe and the surrounding air, the greater will be the heat thrown off and the more rapid the cooling effect on the pipe, and the fact that the cooling effect on the glass at 70deg. is not one-fourth so rapid as that on the pipe surface at 160deg. appears to be entirely ignored.

I could, if time permitted, quote discrepancies in other directions, as on the size of mains, the temperature of the water as it leaves, and as it returns to the boiler, i.e., the loss of heat between the flow and return pipes; the insufficient pipe surface, boiler power, the excessive consumption of fuel, etc. My object at present is to call your attention to the fact that we are all at sea, and are blindly groping after and following each other, and it is time that something should be done to correct the errors of the past.

Of all the boilers in the market to-day, wrought or cast, self-contained or brick-seated, English or American, is there one that will do the work claimed for it? Many of them will not do 75 per cent. of it with good fuel and the best attention. How, then, can they be expected to keep the pipes hot for ten or twelve hours on a frosty night with a banked-up fire? Most of the boilers now offered to the public ought to have the heating powers written down 25 per cent., and some of them may be reduced 40 per cent. with advantage to all concerned. What countless failures and enormous expenses have been incurred by this over-rating it is impossible to say.

(To be continued.)

\* A paper read before the Institution of Heating and Ventilating Engineers.

## Masters and Men.

**Derby Bricklayers** struck last week for advance in wages from 8½d. to 9d. per hour.

**Builders' Labourers at Long Eaton** struck work last Wednesday for a rise in wages from 5½d. to 6d. per hour.

**The Southport Plasterers** asked at the beginning of the general plasterers' dispute an advance from 8½d. to 9½d. per hour. The masters declined to make the advance, but have now agreed to give a ½d. increase.

**Slaters' Wages and Hours of Labour.**—The Finance Committee of the London County Council at the meeting of that body last week reported the following, which was agreed to:—"The rate of wages inserted in the Council's list for slaters is 9d. per hour, and the hours are stated as fifty in summer and forty-seven and forty-four in winter, but the London Slaters' and Tilers' Union state that the rate should be 10d. per hour and the hours fifty-three all the year round. We have ascertained that there is no agreement between employers and employed on the subject, and we think that in view of this, and of the fact that slaters are not directly employed by the Works Department, the better course would be to omit all mention of slaters from the Council's list. If this were done the regulation would come into operation under which contractors for the Council have to pay the rates and observe the hours in practice obtained in London. We recommend that the trade of slaters be omitted from the Council's list of rates of wages and hours of labour."

**The Building Trade Dispute.**—A meeting of representatives of the trade unions chiefly affected by the present dispute in the building trade was held on the 20th inst. in Manchester. Just over a week ago these representatives met and drew up a basis for a joint conference in the establishment of district boards of conciliation, with a central board to which appeal could be made if necessary. During the week the scheme has been submitted to and has received the sanction of the executive committees of the unions concerned, the result being reported to the gathering yesterday, over which Mr. W. T. Wilson, of Bolton, president of the Amalgamated Society of Carpenters and Joiners, presided. The trade unions have unanimously sanctioned the scheme, details of which will be sent to-day to Mr. Hassal, of Liverpool, secretary of the National Association of Master Builders. It is understood that the offer of the Yorkshire masters, put forward at a recent meeting, to meet the men in conference was scarcely touched upon, the desire of the men being that they should deal with the masters as a whole, and not sectionally. At the same time the feeling was expressed that the withdrawal of the Yorkshire lock-out should be made a condition of the conference.

**New Light Railways.**—The Board of Trade have confirmed orders authorising the construction of light railways from Colwyn Bay to Llandudno, in the parishes of Barton-upon-Irwell, and Stretford, Lancashire.

**Suggested London Improvement.**—"R. E. W." writes thus to the "Times" of June 22nd: "In the narrowest part of Old Bond Street a house is now being pulled down. Has any one the authority to compel its being rebuilt some feet further back and so commence what might lead to the widening of that most crowded and narrow street?"

**New Fire Station at Islington.**—At last week's meeting of the London County Council it was agreed to accept the estimate of £14,400 submitted by the Finance Committee in respect of the erection of the new Islington station in Upper Street, and to sanction an expenditure of £14,033 for the work of erecting the station.

## Builders' Notes.

**The Isolation Hospital, Braintree,** has recently been supplied with Messrs. E. H. Shorland and Brother's patent Manchester Grates.

**The Re-roofing of the Crystal Palace** has been entrusted to Messrs. Mellows and Company, of Sheffield and London, of 28, Victoria Street, Westminster, S.W.

**A Timber Merchant's Failure.**—Last Wednesday, in the Queen's Bench Division of the High Court of Justice, before Mr. Registrar Giffard, Edward Harfield Barton and E. H. Barton the younger, described as carrying on business in the above style as timber merchants, at 57, Gracechurch Street, E.C., sat for public examination. The statement of affairs showed liabilities £35,117, of which £12,848 were unsecured, and assets £11,175. After evidence was given by both parties, a dividend of 3s. 6d. in the pound was paid, and the senior partner received an unconditional order of discharge.

**A Penny a Week.**—**Workmen's Compensation Act.**—At Northampton County Court a lad whose finger had been crushed at the Grose Bicycle Gear Case Company's Works claimed damages under the Workmen's Compensation Act. As a learner he had been earning, before the accident, 10s. a week, but since the accident he had been employed by the respondent company as a fitter at an average wage of upwards of 12s. For the respondent company it was contended that as the wages had been increased there was no ground for compensation under the Act, which laid it down that in awarding damages regard should be had to the amount of wages before and after the accident. Judge Snagge said he would not interpret the words of the Act in the cast-iron way supported by the respondents, but would award the nominal compensation of one penny a week. This would allow the question of compensation being brought up for review, should it in the future be found that applicant was injuriously affected by the accident. The respondent company said there would be an appeal.

**A Bricklayer's Bill.**—At the Norwich Police Court last Wednesday, before the Mayor and other magistrates, Arthur E. Chittock, bricklayer, of St. Benedict's Street, sued Walter Nickalls, fishmonger, of the same street, to recover £1 6s. for wages. Mr. E. Reeve defended, and remarked that Mr. Nickalls disputed the greater portion of the claim. Plaintiff stated that he had been engaged about defendant's premises about sixty hours doing bricklaying. Before the account was delivered defendant paid him 4s. After the work was done plaintiff asked him to settle, but defendant refused to pay him a penny, and would give no reason for his refusal to do so. The defendant contended that plaintiff had spread the work over sixty hours, and that 15s. was sufficient for the work done. He said that he was in the habit of paying the plaintiff 6d. an hour. George Pitcher, a builder, said he had inspected the plaintiff's work, which could have been done in fourteen or fifteen hours, with the exception of the stable. The Bench gave judgment for the plaintiff for 6d. an hour for fifty hours, which, deducting the 4s. already paid, left £1 1s. with costs.

**Killed Two Miles from the Factory.**—An application was made in the Edinburgh Court of Session by counsel on behalf of the widow of Adam Whitton, carter, who, for herself and six children, brought a claim in the Sheriff's Court at Dundee under the Workmen's Compensation Act, against Bell and Sime Limited, timber merchants and saw millers, of Marine Parade, Dundee, for compensation in respect of the death of her husband. The amount claimed was £163. Whitton was sent on the morning of Nov. 4th, 1898, from his employers' works with a horse and cart to

take a load of wood to a villa which was being erected on ground held in fee from Mr. Hunter, of Blackness. He was instructed to go by Blackness Avenue, and in that part of his journey a retaining wall gave way, and the cart, horse, and driver were thrown over, and the man was crushed to death under the cart. Sheriff-substitute Campbell Smith found it not proven that the death of Whitton was caused by his serious and wilful default, and he held the employers liable. The employers appealed. On June 16th, in the First Division of the Court of Session, their Lordships reversed the decision. The Lord President said there was no doubt that this man was at a distance of two miles from the works when the accident happened, and he, therefore, could not possibly come under the description of employment "on or about a factory" in the sense of the Act.

**A Question of Costs.**—The case of Skeggs v. Keen was heard in the Supreme Court of Judicature recently before Lords Justices A. L. Smith, Rigby, and Vaughan Williams. This was the appeal of the plaintiff from an order as to costs made by his Honour Judge Addison, sitting at the County Court of Southwark. The question raised the construction to be placed on section 1, sub-section 4, of the Workmen's Compensation Act. That section allows a workman who brings an action under the Employers' Liability Act and fails, to ask that, as he has failed under the Employers' Liability Act to prove negligence on the part of his employers or his servants, he may be allowed compensation under the Workmen's Compensation Act, which gives certain classes of workmen compensation unless serious or wilful misconduct is proved against them, though the master may not be in any way to blame for the accident. Under the section in question Skeggs, having failed to prove his case against Mr. Keen under the Employers' Liability Act of 1880, claimed compensation, and was awarded £23 4s. The arbitrator adjudged that as the workman had failed in his action he must pay to his employer the costs of such failure, which were fixed at £26 9s. The parties subsequently moved the learned judge in the matter, and he directed that the injured workman should not have any costs, on the ground that if he had brought his claim under the right Act there would have been no litigation, as he probably would have been paid; and, further, that there was no power under the Act of 1897 to give costs to a workman who made his claim for compensation only when he was beaten under the Employers' Liability Act. Against that order the workman now appealed. Lord Justice A. L. Smith said the plaintiff carried in his bill of costs as if he had succeeded in the action as well as in the arbitration, and the master very properly objected to pay it. The only costs of litigation that had been incurred arose under the action, and therefore the workman, having failed, could claim no costs from his master, who had succeeded in defending the claim under the Act of 1880. The other Lord Justices concurred, and the appeal of the workman was dismissed with costs.

**Sewerage at Trefw.**—The Local Government Board has given the Geirnydd Rural District Council permission to borrow £400 for sewerage work at Trefw.

**A Painter was Fatally Burned** in a man-hole on the Stanley Dock Bridge, Liverpool. The man, whose name is John Harver, had finished his work, and was handing up his pot to a comrade when the contents upset and covered him. At the same time they became ignited through the flame from a handlamp, and the man died from the burns which he received.

**The Demolition of the Front Part of Clarendon Buildings,** Lord Street, Liverpool, will begin on July 1st, and on August 1st the Countess of Derby will lay the foundation-stone of the first section of the Church House for the Liverpool diocese. The structure will be of brick and terra-cotta, and the builders' contract is for £13,200.

## Trade and Craft.

### GLASS BRICKS.

How to build a strong glass house is a difficulty which the manufacturers of the "Falconnier" patent glass bricks, whose agents are Messrs. H. Pahl and Co., of 44, Farringdon Street, London, E.C., seem to have overcome. These were effectively shown at the recent Building Trades' Exhibition, and the memory of their beauty and advantages will, no doubt, be still in the minds of those who visited their stand. A short account, however, of the advantages claimed for this patent may be of interest. The bricks are made of blown glass of any desired colour. They are hollow, and contain air, which is hermetically closed in. The laying is accomplished in exactly the same manner as with ordinary bricks. Although light enters freely through a wall built of these bricks, it is not transparent. The temperature of a room built of glass bricks changes very slowly, as the bricks contain air and act as double windows would. One splendid advantage which the firm claim for their speciality is that it is fireproof. They have just patented a special design of a fireproof glass brick. The accompanying illustration shows a building in which the bricks have been used.

### A NEW SANITARY APPLIANCE.

We have just received a copy of Messrs. Adams and Co.'s new catalogue of closets, urinals, slop sinks, &c. Among the contents we specially notice what seems to be a very useful invention, viz., the Automatic Flush Tank Governing Gear, of which an explanatory diagram is here given. The automatic flush tank has up to the present proved somewhat wasteful, for, being set to discharge itself into the latrine or urinal a certain fixed number of times per diem (governed by the inflow of water to the tank), this discharge has taken place quite independently of the actual and varying needs of each case. Messrs. Adams have introduced this arrangement for regulating the discharge of the automatic flush by the use of the closet, latrine, or urinal; hence, if there is no use there is no discharge. The apparatus can be applied to any existing latrine or urinal at comparatively small cost. The illustration shows a small controlling vessel which receives overflow from closet or urinal. The filling of this vessel brings on a feed of water to the flush tank sufficient to start its syphonic action (it having already been partially filled by a ball cock). When the flush takes place, the apparatus empties itself automatically, and, as the closet or urinal overflows again, the operation of starting flush tank is repeated. Briefly, the arrangement is, that when there is no use of the closet or urinal there is no flush, but the

overflow caused by use brings on a discharge of the tank, so that only when water is actually needed is it expended in flushing. The arrangement is working admirably on the North-Eastern, Midland, and Great Northern railways, and the makers claim that it saves from 30 per cent. to 50 per cent. of the water account

from the flushing of closets and urinals. The controller is also applied to single closets. The catalogue is well printed on good paper, and is fully illustrated; altogether, it is one of the most attractive catalogues we have seen for a long time.

## Surveying and Sanitary Notes.

**Improvements at Manchester.**—A Local Government Board inquiry was held at the Manchester Town Hall last week into an application by the Corporation for permission to borrow £60,000 for equipping the technical school, which was recently built at a cost of £140,000, £7,050 for the site of the new central fire station near Stevenson Square, and £4,000 for the purchase of land in Bradford in which to place public baths.

**London County Council Loans.**—At the usual weekly meeting of the Council last Tuesday week, on the recommendation of the Finance Committee it was decided to lend the Fulham Vestry £25,000 for electric lighting purposes, the St. James's, Westminster, Vestry £3,200 for paving works, the Lee District Board £2,480 for paving works, the Limehouse District Board £4,120 for street improvements, the St. Margaret and St. John, Westminster, Vestry £12,700 for paving works, and the Central London Sick Asylum District Managers £27,440 for provision of an asylum at Hendon.

**Artizan's Dwellings in Birmingham.** At a meeting of the Improvement Committee of the City Council last Wednesday the tenders for the erection of working men's dwellings in Milk Street were considered. The scheme adopted by the council was for the erection of six blocks of buildings, containing sixty-one tenements on the dual system at an estimated cost of £10,000. Fifteen tenders were sent in, and the lowest, that of Messrs. B. Whitehouse and Sons, of Monument Road, was accepted. The committee proposed to do part of the work themselves. They will put in the foundations up to the footings, make the roads, and execute the work in connection with the sanitary arrangements. This will comprise about one-fifth of the whole work. As a little alteration is contemplated in treating the internal details of the houses, the committee do not feel justified in stating the exact amount of the contract, but the total cost will come within the estimate.

**The Sanitary Institute.**—The preliminary programme of the Eighteenth Congress, to be held in Southampton, from August 29th to September 2nd, has now been issued. The President of the Congress is Sir W. H. Preece, K.C.B., F.R.S., Pres.Inst.C.E. Mr. Malcolm Morris, F.R.C.S.Edin., M.R.C.S.Eng., will deliver the lecture to the Congress,

A HOUSE BUILT WITH "FALCONNIER" GLASS BRICKS.

and Bailie J. Dick, J.P., Chairman of the Health Committee, Glasgow, will deliver the popular lecture. Excursions to places of interest in connection with sanitation will be arranged for those attending the Congress. A conversazione will be given by the Mayor (Councillor G. A. E. Hussey). It appears from the programme that over 300 authorities, including several County Councils, have already appointed delegates to the Congress, and, as there are also over 2,200 Members and Associates in the Institute, there will probably be a large attendance in addition to the local members of the Congress. In connection with the Congress, a health exhibition of apparatus and appliances relating to health and domestic use will be held as a practical illustration of the application and carrying out of the principles and methods discussed at the meetings; it not only serves this purpose, but also an important one in diffusing sanitary knowledge among a large class who do not attend the other meetings of the Congress. The Congress will include three general addresses and lectures. Three sections meeting for two days each, dealing with (1) Sanitary Science and Preventive Medicine, pre-ided over by Sir Joseph Ewart, M.D., F.R.C.P., J.P.; (2) Engineering and Architecture, presided over by James Lemon, M.Inst.C.E., F.R.I.B.A.; (3) Physics, Chemistry, and Biology, presided over by Professor Percy F. Frankland, Ph.D., B.Sc., F.R.S. Eight Special Conferences: Municipal Representatives, presided over by Alderman T. Walton, J.P., Chairman of the Health Committee, Southampton; Port Sanitary Authorities, Millar Wilkinson, Chairman Port of London S.A.; Medical Officers of Health, presided over by T. Orme Dudfield, M.D., L.R.C.P., M.R.C.S.; Medical Officers of Schools, C. G. Shelly, M.A., M.D.; Engineers and Surveyors to County and other Sanitary Authorities, presided over by E. Purnell Hooley, Assoc.M.Inst.C.E.; Veterinary Inspectors, W. Hunting, F.R.C.V.S.; Sanitary Inspectors, presided over by C. MacMahon, Chief Sanitary Inspector, Torquay; Domestic Hygiene, presided over by Mrs. Patey. The local arrangements are in the hands of an influential Local Committee, presided over by the Mayor of Southampton, with A. Wellesley Harris, M.R.C.S., D.P.H., W. B. G. Bennett, Asso.M.Inst.C.E., W. Matthews, M.Inst.C.E., and C. H. Russell, M.R.C.S., D.P.H., as honorary secretaries.

Engineering Notes.

**Angel Hotel, Peterborough,** is being fitted with an entirely new installation for the complete warming and ventilation, by John King, Limited, engineers, Liverpool, by means of their Rajah ventilating radiators and their patent tubular exhaust ventilators.

**The New Premises of the National Telephone Co., Limited, at Belfast,** have been fitted with an entirely new installation for the complete warming and ventilation by John King, Limited, engineers, Liverpool, by means of their Rajah ventilating radiators and their patent tubular exhaust ventilators.

**The Mersey Docks Board** has decided to carry out the following works at Birkenhead : To deepen the Alfred Dock 100ft. lock; to alter the sills of the Alfred Dock inner 100ft. passage, and Morpeth Dock west passage; and to provide additional pumping machinery at the pumping station, Wallasey Dock. These works will involve an expenditure of about £51,000.

**Tramway Extensions at Huddersfield.**—The Huddersfield Corporation applied to the Board of Trade for power to borrow £47,782, to enable them to erect a power station, and to electrically equip three sections of tramway, of which one has already been constructed, and the other two are to be constructed. At an enquiry held on the 13th inst. the following particulars as to cost were given:—Power station, £8,000; equipment, plant, &c., £17,120; equipment of routes, £11,162 2s. 4d.; twenty-three cars, £11,500; total, £47,782 2s. 4d.

**A Railway to the top of Mont Blanc** will, in all probability, be shortly commenced. The most difficult part would be the 3¼ miles from Aiguille du Géant to the summit, but here the line would be carried on a special gallery which, though laborious of construction, is deemed the most practical method. The line would start from Chamonix, and extend almost to the apex of the great mountain, the length being 6¼ miles and the total cost, as a

result of a preliminary survey, is put at £500,000, of which one-half is due to the gallery near the top.

**Waterloo Station.**—The Select Committee of the House of Lords, presided over by Lord Herries, last Monday week, considered the Bill of the London and South-Western Railway Co., which deals with the improvement of the company's terminus at Waterloo. The scheme advances the expansion of the station on both sides. Counsel for the promoters were Mr. Pember, Q.C., Mr. Page, Q.C., and Lord Robert Cecil, Q.C.; Mr. Balfour Browne, Q.C., and Mr. Wheeler, Q.C., appeared for the Lambeth Vestry, and also for Messrs. J. Rolls, Hoare, and Co., varnish manufacturers.—Counsel, in opening the case, said that the opposition to the Bill was reduced to the case of the Lambeth Vestry. Terms had been agreed to between the London County Council and the railway company, under which the railway company would, instead of widening York Street, hand over to the London County Council a sum of £30,000 to be expended by that body for the purposes of metropolitan improvements within the area affected by the Bill in such a manner as would meet with the approval of the Lambeth Vestry. After hearing the arguments of counsel in respect to the opposition of Messrs. Rolls, Hoare, and Co., the Committee decided that notice should be given to that firm of the taking of their premises within three months of the passage of the Bill.—Mr. Balfour Browne, Q.C., addressed the Committee on behalf of the Lambeth Vestry, whose opposition, he said, was chiefly to the clause of the Bill to which the London County Council had assented, which allowed the railway company, with the consent of the Home Secretary, to rehouse the poor who would be displaced under the Bill within a mile of their present abodes instead of, as usual, within half a mile. There was no reason for departing from the ordinary law in this case. If the railway company could find a fresh site, as they admittedly could, close at hand upon which to reconstruct the works of Messrs. Rolls, Hoare, and Co., their contention fell to the ground that they could not find a suitable site to rehouse these poor people.—Mr. Pember, Q.C., having replied for the railway company, the Committee decided that the clause as arranged with the County Council should stand, and passed the preamble of the Bill.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
June 30	Brighton—Underground Convenience	Town Council	F. J. C. May, Borough Engineer, Town Hall, Brighton.

Sept. 1	Otley—Isolation Hospital	£30, £15	C. V. Newstead, Clerk, Wharfedale Union Joint Hospital Committee, Union Offices, Boroughgate, Otley.

# Property and Land Sales.

**FINCHLEY.**—Important Sale of about 23 acres of exceedingly eligible FREEHOLD BUILDING LAND, occupying exceptionally fine and elevated positions on the main London road and Nether-street, five minutes from Finchley Junction (G.N.R.), eight miles from town, and unquestionably some of the choicest land available in the northern suburbs for immediate building operations.

**MESSRS. KEMSLEY** will **SELL** by **AUCTION** at the Mart, E.C., on **MONDAY, JULY 10th**, at **TWO o'clock**, in **Four Lots**, the valuable **FREEHOLD PROPERTIES**, comprising the attractive residence, **Field Cottage**, **Ballard's-lane** (the main road to **Barnet**), together about **83 acres**, having valuable frontages to **Ballard's-lane** and **Long-lane**; the highly important block of **Building Land** of nearly nine acres, with extensive frontage to the main road; two blocks of very eligible Land, with valuable frontages to **Nether-street**, and comprising an area of about three and a quarter and two acres respectively. Each of the properties are thoroughly ripe for the erection of a superior class of property, for which the demand at **Finchley** is much in excess of the supply.

Particulars of **Messrs. CARTER, VINCENT, DOUGLAS-JONES** and **Co.**, Solicitors, **Barnet**; of **A. STOKES, Esq.**, Solicitor, **43, Bedford-row, W.C.**; and of the **AUCTIONEERS**, **41, Bishopsgate-street-within, E.C.**, and at **Woodford Green** and **Romford**. 1

**CHADWELL HEATH, ESSEX.**—Adjoining the **G.E.R.** main line station, ten miles from town, and close to **Ilford**. A highly important and fully ripe **FREEHOLD BUILDING ESTATE** of **58 acres**, occupying an unusually fine position, with extensive frontages to existing roads, and very favourably circumstanced for immediate development to cope with the rapidly growing demand for small villas in this locality. Gravel subsoil.

**MESSRS. KEMSLEY** will **SELL** the above by **AUCTION** at the **MART, E.C.**, on **MONDAY, JULY 10th**, at **TWO o'clock**, in **One Lot**. Particulars of **Messrs. E. F. and H. LONDON**, solicitors, **53, New Broad-street, E.C.**; and of the **AUCTIONEERS**, **41, Bishopsgate-street-within, E.C.**, and at **Woodford Green** and **Romford**. 1

**GREEN-LANES, WOOD GREEN, N.**—166 Lots of exceedingly valuable **FREEHOLD BUILDING LAND**, free from tithe and land tax, in a rapidly increasing, convenient, and accessible district, near **Green-lanes Station** on the **G.E.R.** and **Hornsey Station** on the **G.N.R.**, the cars of the **N.M. Tramway Company** passing the estate, comprising a commanding corner site, having an important frontage to the **Green-lanes**, suitable for the erection of business premises; and **165 Plots**, with frontages to **West-berry-avenue** and the new roads leading therefrom, affording choice sites for the erection of villa residences, which are greatly in demand, and the property being fully ripe for building operations offers an excellent opportunity for the erection of ground-rent. Also one Lot with a paddock in the rear. For **SALE** by **AUCTION**, on behalf of

**THE BRITISH LAND COMPANY, LIMITED**, at the Manor House Tavern, **Green-lanes, Finsbury Park**, on **THURSDAY EVENING** next, **JUNE 29th**, at **SIX and SEVEN o'clock**. Free conveyances. Possession on payment of 10 per cent. deposit, balance payable by easy instalments extending over nine years.

Particulars, plan, and conditions of sale may be obtained of the **SECRETARY**, **25, Moorgate-street, E.C.**; and at the **Place of Sale**.

SALE DAYS for the Year 1899.

Messrs.

**FABREBROTHER, ELLIS, EGERTON, BREACH, GALSWORDY, and CO.** beg to announce that the undermentioned dates have been fixed for their **AUCTIONS** of **FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c.**, at the **AUCTION MART, Tokenhouse-yard, E.C.**

Other appointments for intermediate Sales will also be arranged.

Thursday, June 29  
Thursday, July 6  
Thursday, July 13  
Thursday, July 20  
Thursday, July 27  
Thursday, Aug. 3  
Thursday, Aug. 10

Thursday, Oct. 12  
Thursday, Oct. 26  
Thursday, Nov. 16  
Thursday, Nov. 23  
Thursday, Dec. 7  
Thursday, Dec. 14

**Messrs. FABREBROTHER, ELLIS, and CO.** publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

**LINDFIELD, Sussex.**—1½ miles from **Hayward's Heath Station**, whence there is a capital bus service.

**MESSRS. DRAWBRIDGE and ANSELL** have received instruction to **SELL** by **AUCTION**, at the "Bent Hotel," **Lindfield**, on **WEDNESDAY, JULY 5th, 1899**, at **SIX o'clock** in the evening, thirteen valuable **FREEHOLD BUILDING PLOTS** (immediately adjoining this quaint and picturesque town, with its unrivalled common and pretty pond, and which is well known for its healthy situation and beautiful surroundings), ripe for the immediate erection of detached or semi-detached villas, which are greatly in demand in this locality.

Particulars, with plans and conditions of sale, may be had of **Messrs. DRAWBRIDGE and ANSELL**, Auctioneers, Estate Agents, and Timber Valuers, **Hayward's Heath, Sussex**.

## CITY OF LONDON.

**City Improvements.**—By order of the Corporation. To **Brewers, Licensed Victuallers, Restaurateurs, and others.** Offering an opportunity of securing one of the finest sites for licensed premises.

In the heart of the shipping, wine, Colonial, and corn trade centres.

The valuable **Free LEASE** of the important corner **Building Site**, together with the License thereto attached, now occupied by fully-licensed premises, the **Mercantile**, and the adjoining property known as **126, Fenchurch-street, E.C.**

Having a frontage of about **36ft. 5in.** to **Fenchurch-street**, and about **43ft. 2in.** to **Fen-court**, which is now being widened, and will form an important thoroughfare, with an enormous pedestrian traffic, the whole covering an area of about **1,374 square feet**. A free lease for sixty-five years will be granted at the moderate ground rent of **£300 per annum**.

**MESSRS. DOUGLAS YOUNG and CO.** will **SELL** the above by **AUCTION**, at the **MART, E.C.**, on **WEDNESDAY, JULY 19th, 1899**, at **ONE o'clock** precisely.

Plans, particulars, and conditions of sale may be obtained of the **COMPTROLLER** or the **CITY ENGINEER**, **Guildhall, E.C.**; or of the **AUCTIONEERS**, **No. 51, Coleman-street, E.C.**; **313, Clapham-road, S.W.**; and **Ilford, E.**

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, **21, Buckingham-street, Strand, W.C.**

**R. I.B.A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, nine, or twelve months' courses. **Architectural Lending Library.** Special three months' finishing courses.—For full particulars apply to **Messrs. HOWGATE and BOND, Associates R.I.B.A.**, **Perchard House, 70, Gower-street, W.C.** (close to the **British Museum**).

**ARCHITECTURAL Institute, Society of** Architects, and Civil Service Technical Examinations. Preparation by correspondence, personally, or in residence. Seventeen first places.—**MIDDLETON and CARDEN, 19, Craven-st., W.C.** 1

**MASON'S CHISEL, STEEL, ½ to 1½** octagon, 12s. to 16s. per cwt.; Chisels, 6d. lb.; Best Cast Steel for Lettering Tools, &c., from 4in. to 14d. lb.—**E. DEALEY, Moore-street, Sheffield.** 5

**CARPENTER and JOINER'S WORK** WANTED; piece work; labour only; any description or large quantity.—Box 1103, **BUILDERS' JOURNAL Office.** 1

## APPOINTMENTS VACANT.

**TRAVELLER WANTED** for **East End, London**, with knowledge of lime, cement, and brick merchant's trade.—Apply, stating age, experience, and salary required, to **Box No. 1102, BUILDERS' JOURNAL Office.** 1

**WANTED, immediately, ENGINEER** to act as under Manager of Cement Works. Must have had practical experience and character bear strictest investigation.—State age, wages, &c., to **CASEBOURNE and Co., Limited, West Hartlepool.** 1

**ARCHITECT'S ASSISTANT REQUIRED** at once: must be experienced.—Apply, giving age, salary, and qualifications, to **Box 1105, BUILDERS' JOURNAL Office.** 1

**ARCHITECT'S ASSISTANT REQUIRED** at once; able to make working and detailed drawings and assist with quantities.—Apply, stating age and references, **LANCASHIRE and SON, Hartshead, Sheffield.** 1

# Architectural Competition

. . . FOR . . .

## A VILLA ON THE RIVIERA.

The Proprietors of the ARCHITECTURAL REVIEW have been commissioned by Sir William Ingram, Bart., to obtain designs for a villa which it is his intention to build on a site facing into the bay of Monaco. In view of the success attending the competition in the "Builders' Journal" for the design for a country house in Kent, it has been decided to open a similar competition for the villa in question.

### PREMIUMS AMOUNTING TO 110 GUINEAS

are offered. Particulars are given in the ARCHITECTURAL REVIEW for July.

*Amongst other valuable matter the following Articles also appear in the issue for July:*

KENSINGTON PALACE: By W. J. Loftie, B.A., F.S.A., illustrated by special photographs and engravings.

THE DECORATION OF ST. PAUL'S: By Edward S. Prior.

BOURGES: ITS CATHEDRAL AND OTHER CHURCHES: By S. N. Vansittart: Part One.

TABLE GLASS: By Harry J. Powell, with special illustrations by the Author.

THE WELL HEADS OF VENICE: By F. Hamilton Jackson, illustrated from drawings and photographs by the Author.

RUBENS: By R. A. M. Stephenson.

ART FROM THE POINT OF VIEW OF SOCIOLOGY: By M. E. R. Guyau. Introduction.

ARCHITECTURE AND CRAFTS AT THE ROYAL ACADEMY: Third Supplement.

## "BUILDERS' JOURNAL" EXHIBITION.

By kind permission of the Committee of the Architectural Association, an Exhibition of the 134 sets of drawings submitted in connection with our competition for a country house at Hythe is being held this week at the rooms of the Association, 56, Great Marlborough Street, W. The Exhibition, which is open daily between the hours of 10 a.m. and 7 p.m., will close next Saturday.

## An Architectural Causerie.

### The Conduct of Competitions.

CONSIDERING that the competitive system has apparently come to stay,

and considering how much additional work is thus imposed on the profession, is it not time that some effort should be made to simplify this system and lessen the work? We seem to want, first of all, a better understanding between the assessor and the assessed; the general principles on which the designs are to be judged need to be laid down, and generally understood. If one compares the selected designs in almost any competition, it is most difficult to understand on what principle they were selected. Given a certain site, a certain programme of accommodation required, a certain sum of money to spend, it is evident that there is the best way of treating the scheme, which way becomes the right way; yet you often get three selected designs, each one entirely different from the others, absolutely contrary in general idea and treatment. The obvious inference is that if one is right the others are wrong, and if so, on what principle were they placed? In every competition you find the scheme treated in a variety of ways, the designs showing contrary general ideas. The question is—should the assessor select all those which give what he considers the right general idea, and then from these select the three in which this idea is best worked out, so as to get three on the same lines arranged in order of merit—to the prejudice possibly of others which are far better worked out and more complete and artistic in themselves, but on the wrong lines—or should he select the best examples of three different treatments, as he generally seems to do? Should the prize go to the best idea, however poorly worked out; or to the design which is most finished and complete in itself, however wrong the idea? If, as was the case not long ago, the subject is a Town Hall and Municipal Offices, and the assessor

happens to be of the opinion that, under the special circumstances, the right idea is to make the two buildings distinct and separate; should the award go to one which adopts this general idea—even though the plan of the office block be most poorly worked out, though main walls and chimney stacks and strong rooms be carried on girders, and the general effect be feeble in the extreme—to the prejudice of others far better in themselves, but which showed the two buildings joined together? In such a case as this would the assessor consider that, given the right idea, the competitor could be trusted to work it out more thoroughly and make a job of it in execution, and, if this was his idea, is it the right principle on which to assess? Again, how far is it permissible to award the premiums simply on the convenience of the arrangements, with no thought of architecture, as we often see done? Given a certain programme, it is compara-

tions, and simplifies matters considerably; but if he is there to choose what he thinks the public would like, his use is not very obvious, the public could choose so much better for itself. If we could only get a general agreement on this one point, how much wasted labour—not to mention self-respect—would be saved, labour now expended in trying to tickle the popular taste, in inventing wonderful features to catch the assessor's eye and warp his judgement. But if, on the other hand, the assessor has simply to voice the popular taste, we need waste no more time in trying to produce architecture. And as regards waste of time and labour, why is it necessary to make so many highly finished drawings? They are quite thrown away on an assessor who knows his work. Such a man could judge quite well from the preliminary small sketches which most people make before they start to draw out their designs. Why could not these sketches be

DRAWN BY C. G. HARPER.

tively easy to arrange the accommodation conveniently; the real difficulty comes in when we try to arrange it artistically as well—to make architecture of it. It is comparatively easy to plaster on an arbitrary elevation that has little or no relation to the plan; the real difficulty is to design the plan so that a good elevation grows from it naturally—becomes inevitable. How far is an assessor justified in giving credit to a pleasing elevation that is not a natural growth from the plan? This opens up the general question—How far are the principles of Architecture, as generally understood, to be applied in assessing a competition? If they are to be enforced, then badly constructed schemes and false elevations would be out of court, however convenient their arrangements. Is an assessor appointed to give the public what it wants? or what it ought to have? If we admit that he is there to tell the public which design is really the best this provides an answer to many other ques-

sent in with explanatory notes, and so save the enormous waste of time and money involved in the present method? A. R. J.

### "The Leather Bottle," Merton.

THOSE who know Wimbledon and its

neighbourhood well will learn with regret that the picturesque house, known as the "Old Leather Bottle," at Merton Rush, has just been pulled down. It was a humble, but curious and extremely countryfied, old roadside inn, which, in common with the famous "Leather Bottle" at Cobham, near Rochester, and two or three other examples throughout the country, helped to keep alive the memory of the days before glass bottles were cheap enough to be used for common occasions. As a plain matter of fact, however, the clumsy-looking sign of this inn was made not of leather, but of wood, and did not in the least resemble the shape of the old Black Jacks, as the ancient leathern bottles were called.

G. G. H.

## An Architectural Plan.

POSSIBLY the most difficult thing that an architect is called upon to do is to plan satisfactorily, at the same time for convenience and for architectural effect. To plan for convenience only is comparatively easy, and so it is to plan for elevation alone; and even a convenient plan which also lends itself to pleasing elevational treatment is seen with sufficient frequency, particularly in competition designs. But still, a truly architectural plan is rare—a plan which, while suited to its purpose, compels architectural treatment, not only in elevation, but in mass, not only externally, but internally. It is not too much to say that every architecturally important building which the world possesses is so planned, nor too much to prophecy that every really great building of the future will, of necessity, be similarly treated. The architectural in planning is therefore worthy of most earnest study by all those who aim at producing works of lasting value—that is, by every living architect. And it has been an almost neglected study in England! Possibly its neglect has been at the root of our failure, save very rarely, to rise above the commonplace in important public works, in an age when such are constantly being undertaken, both in the metropolis and in our provincial towns and cities, and when we frequently succeed in dealing with smaller works demanding only convenience and picturesqueness. In fact, many an erected failure could be pointed out which possesses every element of success except this one essential of an architectural plan, such as would, of necessity, have led to noble grouping and harmonious distribution of the parts externally and to fine vistas within. Without this, delicate elaboration of detail is of no avail—nor good isolated features—nor a picturesque outline—nor fine rooms. A great building, above all things, must be *planned*. It must be arranged so that, whether considered as a whole or in detail, it is entirely satisfactory from every point of view—it must be planned not merely to be drawn on paper, but to be built: to be seen and enjoyed in centuries to come. And the study of the great buildings of the past which have been so arranged must, to be of real value, be personal. Let us study drawings of them first, by all means, particularly the plans; but then let us see them, if we wish ever to do as well, and note the effects for ourselves. Next best to this—for travelling is expensive and not within the reach of all—come photographs exhibited by a good lantern. But photographs can each show but a single view, and not always the one most wanted for an understanding of the effect as a natural development of a greatly-conceived architectural plan.

G. A. T. M.

## OUR COMPETITION.

The assessor's awards in the Competition recently held for designs for a country house will be found on page 321. The whole of the drawings submitted are now being exhibited at the rooms of the Architectural Association, 56, Great Marlborough Street, W. The exhibition, which is open daily between the hours of 10 a.m. and 7 p.m., will close next Saturday.

## On Reflection.

### An "Architectural Review" Competition.

THE novel plan of introducing clients to architects by means of a competition in a trade journal, has led to some interesting developments we did not originally contemplate. As we announced last week, we hope to be able, apart from the commission for building the house at Hythe, to place other commissions in the hands of some of the architects who have taken part in our competition, another client having intimated his intention of erecting houses from some of the designs submitted. The great success of this competition has encouraged our big brother, the "Architectural Review," to launch out with a similar scheme. In the July number, just published, will be found particulars of a competition, to be held in connection with the "Review," for a Villa on the Riviera, to be erected for Sir William Ingram, Bart. The premiums offered are seventy-five guineas, twenty-five guineas, and two of five guineas each, and we have no doubt the scheme will be as heartily taken up as our own has been.

### To Save Killarney.

THE provision of open spaces in our towns and cities is now generally regarded as a fitting object for public enterprise and for private generosity. But in many cases the work is rendered more difficult and expensive by the neglect of former generations. There seems some little danger that a similar thing may happen in regard to some of the most beautiful spots in the country; that for want of a little foresight we may allow some of these fair spots to be bought up and closed to the public, leaving to future generations the burden of buying them back at enormous cost for public use—if, indeed, the demon "Jerrybuiltus" has not already spoilt their beauty. There is some fear that this evil fate will overtake the famous Muckross Estate at Killarney, and an effort is being made to impress upon the Government the desirability of purchasing the estate as a national playground after the manner of the Yellowstone Park in America. The suggestion is not a new one; a correspondent of the "St. James' Gazette" states that he has been urging this step upon her Majesty's Government for nearly twenty years without—it need hardly be said—receiving much encouragement. There are, of course, difficulties in the way of Government action in such cases. If once the policy of purchasing a country estate for public use is admitted, it may be difficult to say where it is to stop; if Killarney, why not other beautiful places? Still, the spoiling of "Beauty's home, Killarney," would be so great a calamity that almost anything should be done to prevent it. That useful society, the National Trust for Places of Historic Interest has the matter in hand, and may be trusted not to let it rest till the danger is averted.

### A Point for Road Contractors.

A QUESTION of considerable importance to road contractors was argued in the Queen's Bench Division last week, when Messrs. Fry Brothers, engineers and contractors, brought an action against Mr. Cameron Corbett, M.P., for the balance due on a contract for making-up roads on his building estate at Lewisham. There was no dispute as to the amount due, and the action appears to have been a friendly one designed to decide the mode in which payment for such contracts should be made. The defendant

maintained that he was not bound to pay until the work was finished, though he had in fact paid £17,000 out of the £21,372. But the roads could not be completed till the houses were up, because the local authority would not give a certificate till then, and there was no obligation on the defendant to build within any given time. It would follow, therefore, that if Mr. Corbett's view of the building owner's obligations to the road contractor is correct, the latter is liable to have to wait an indefinite time for payment. That might be a very serious matter for the contractor, and we do not understand that Mr. Justice Grantham, although he gave judgment for the defendant, endorsed that view. In summing up to the jury he asked them to decide whether the defendant was to pay everything up to the full value of the work done as it was going on, or whether he was bound only to make reasonable advances, and whether the advances that had been made were reasonable. The jury found that the defendant was only bound to make reasonable advances, and that he had done so. It would thus appear that in this matter, as in so many others, the middle course is the right one. On the one hand, the owner of the building estate is not entitled to withhold all payment till the roads are completed (in other words, till his building operations are finished); on the other hand, the road contractor must not expect to be paid in full for all the work done as it progresses.

### School Board and Architect.

IF all public bodies were like the West Mersea School Board there would be very little competition amongst architects for commissions to erect public buildings. A case lately decided in the Queen's Bench Division would seem to show that the members of the Board have but a very rudimentary sense of equity. They engaged an architect, Mr. J. W. Start, of Colchester, to prepare plans for new schools, but on the ground that the cost was too high, they declined to carry them out. A second set of plans was prepared, but again the lowest tender exceeded the limit of cost decided on by the Board. Instead of asking Mr. Start to make a further modification, the Board employed another architect, and declined to pay Mr. Start's fees. He accordingly sued them for £473 5s. 8d. for professional services rendered in connection with both sets of plans. It may be presumed that these plans, although not actually carried out, were of some use to the Board or to the architect finally employed. The jury evidently thought so, for they found for the plaintiff for £150. Even this small consolation, however, was denied to the unfortunate architect, for the defendant's counsel set up the plea that the contract was not a binding one because it was not sealed with the seal of the School Board. Mr. Justice Wills was bound to accept this plea, because it happens to be the law, and accordingly gave judgment for the defendants, but in doing so he expressed regret that this technical plea had been raised, and said it was one with which he had no sympathy. Most people will agree, we think, that to escape from a clear liability on such a pretext is conduct which, if anyone but an architect were concerned, might fairly be stigmatised as dishonest. As however, the victim belongs to that long-suffering class, we suppose the conduct of the Mersea School Board is another example of that colossal and apparently incurable ignorance which seems to affect so many public bodies and so many private clients in regard to matters that pertain to professional practice. Clients too often fail to realise that the preparation of plans involves not merely a high degree of technical, and, perhaps, artistic skill, but also a great deal of hard work.

## "BUILDERS' JOURNAL" COMPETITION.

### THE ASSESSOR'S AWARDS.

IT will be remembered that some weeks ago we announced a competition for a country house, to be erected near Hythe, and offered premiums of twenty guineas, ten guineas and four guineas respectively, for the best sets of designs submitted. A full statement of the requirements of the client and the conditions of the competition will be found in our issue dated May 10th.

The number of designs sent in reached the large total of 134, and these are being exhibited this week at the rooms of the Architectural Association, 56, Great Marlborough Street, W.

Our assessor, Mr. Edward S. Prior, has made a very thorough and careful examination of all the designs submitted, and his awards are as follows:—

**First Premium: Twenty Guineas,**  
HERBERT L. NORTH, B.A. ("Yew"),  
28, Theobald's Road,  
London, W.C.

**Second Premium: Ten Guineas,**  
HARRY PERCY SHARPE ("Eros")  
208, Newton Road,  
Burton-on-Trent.

**Third Premium: Four Guineas,**  
WILLIAM MITCHELL ("Alfo"),  
28, Adelaide Road,  
London, N.W.

**HIGHLY COMMENDED.**—Charles M. Childs, "Caractacus," 85, Albert Street, Regent's Park, N.W.; John W. Rhodes, "Quex," Mitre Court Chambers, Mitre Court, Temple, E.C.; H. T. Rees, and H. M. Macpherson, "Torso," Westgate Chambers, Newport, Mon.; Robert Marchant, "Cypress," 64, Charlotte Street, Fitzroy Square, W.; Henry Rose, "Martello," 3, Staple Inn, Holborn, W.C.; W. L. Dowton, "Pippa," Park Lodge, Peckham Rye; Rupert C. Austin, A.R.I.B.A., "Try," 19, Villiers Street, London, W.C.; Thomas H. Smith, "Thislixum," 27, Friar Stile Road, Richmond; Pilbert Ogilvy, 3, Staple Inn, Holborn, W.C.

**COMMENDED.**—J. Ireland, "Gordon," 23, St. Swinith's Lane, E.C.; R. Wynnburn and Frank I. M. Owen, "Christian," 20, Oxford Road, Waterloo, Liverpool; Arthur H. Moore,

COUNTRY HOUSE AT HYTHE: FIRST PREMIATED DESIGN: THE HALL. BY HERBERT L. NORTH.

"Habitacle," 34 and 35, Southampton Street, Strand, W.C.; C. T. F. Palmer, "Casement," 48, Northwood Road, Highgate Archway, N.; C. A. Edeson, "Simplex," 25, Huntriss Row, Scarborough; A. T. Griffith, "Barbara," The Priory, Saltway, Malvern; A. Bartlett,

COUNTRY HOUSE AT HYTHE: FIRST PREMIATED DESIGN. BY HERBERT L. NORTH.

A.R.I.B.A., and H. F. Waring, "Long and Low 2nd," 65, Chancery Lane, W.C.; R. Morphey, "Build," 39, Cursitor Street, Chancery Lane, W.C.; Herbert T. Buckland, "Dum Spiro Spero," Queen's College, Paradise Street, Birmingham; Harold A. Woodington, A.R.I.B.A., "Red Roofs," 130, Jermyn Street, Haymarket, S.W.; J. W. Cobb, "Home," 121, Blenheim Crescent, Notting Hill, W.; Ernest A. Sudbury, "Appliqué," care of Arthur Marshall, King Street, Nottingham; L. Ingleby Wood, "Tempus Fugit," Riddles Court, University Hall, Edinburgh; J. A. Minty, "Heather 2nd," 10, Gray's Inn Square, W.C.; Henry William Cotman, "Quercus," 25A, Wardo Avenue, Munster Road, Fulham, S.W.

We hope to publish next week a full report on the Competition by Mr. Edward S. Prior. We publish this week the first premiated design; two sketches are here reproduced, and the elevations and plans appear in one of our inset plates. The following is the description which accompanies Mr. North's design:—

This design is an attempt to follow the requirements given as closely as possible in all particulars both as to plan and also elevations.

**ASPECT.**—The front faces north-west. The plan is curved so that the entrance should face south; this arrangement gives "all kinds of angles" on plan, and also enables the front to get more sunshine and a greater diversity of views than it would otherwise have.

**TOWER.**—The tower is intended by contrast to emphasise the "long and low" character of the design, and breaks up what would be a monotonous elevation; also it is not easy to get all the bedrooms required over such a small ground plan without this expedient unless they were much smaller, or the ground plan unnecessarily expanded. The rest of the plan will explain itself.

**EXTERIOR.**—Coming to the exterior, the chimneys are of red or brindled brick, with black headers dotted about.

The roof is thatched; the upper story is tarred weather-boarding. ("Dark stained wood and thatch.") There would be a layer of tarred felt between the quartering and the weather-boarding, the air space between the quartering being the best non-conductor of heat or cold. No bedroom has more than one outside wall. The ground floor and tower are of brick with white rough-cast to keep the house dry, or they could be "white-washed brick," which was mentioned in the first notice of the competition. The windows are leaded lights in wooden frames and casements, which with the shutters would be painted cabbage green. The posts and struts

of the porch are of sawn-faced oak. ("Old timbers.") As an alternative, the weather-boarding might be painted silvery gray or whitish green, and powdered here and there with stencilled flowers and butterflies—

As it were a mede  
Al ful of fresshe floures, white and reede.

**INTERIOR.**—If the cost of the house is not to exceed £2,000 the interior must be kept very simple, and must depend solely on the proportions and the colour for its effect. The wooden floors in the principal rooms and passages downstairs would be of narrow boards nailed to wedge-shaped fillets embedded in cement concrete, the surface of the concrete being well tarred before the boards are laid; this makes a floor similar to wood block flooring at a much lower cost. The author has several times used it when a house is low and the floor has to be close to the ground level.

The fire-places could be in brick or simple wooden mantles with Dutch or other tiles.

The ceiling of the hall, and, if desired, of the other ground floor rooms, would be open, showing suitable joists carrying two layers of boards with felt between. In the principal rooms there would be a small shelf running round, about 1ft. 6in. from the ceiling, for the display of curios.

There is plenty of space for cupboards.

As to the colour, the walls would be washed with Duresco in suitable tints to the uses of each room. If papers are desired, simple diaper or stripe patterns would be suitable. In the hall the woodwork might be Indian red and pale olive green walls; the boudoir pale green and white, and so on, keeping pure, clear colours throughout, so that the effect will always be bright and cheerful.

A cellar could be added if desired, with steps to it, under the back stairs.

**COST.**—The question of cost has been very carefully considered, and the design, when fully cubed, comes out at just over 7d. per square foot at £2,000. This ought to be sufficient as there is not much brickwork for the size of the house.

The rooms are as large as they could be made for the price named; some might be reduced, if desired, with but little alteration to the proportions of plan or elevations.

Finally, all the bedrooms could be moved across to face south-east so as to get the morning sun if preferred.

**NOTE.**—On plan, the best bedroom and study underneath have been shown by accident a foot too narrow, but they have been figured correctly. The elevations are correct.

## THE ART WORKERS' MASQUE.

## WHAT IT MEANS.

THE Masque has been written about from every point of view—almost. Yet the real significance has, with singular unanimity, been overlooked by its critics.

It was not a Socialistic pamphlet translated into pageant; it was not an attempt at drama; it was not a skit on the City or the County Council; nor did it arise out of an insane desire to rival Drury Lane, as certain critics vainly hold.

The essential aim—the vital spirit of the masque—was the ambition of its promoters to show the abidingness of Beauty; that the spirit of beauty still lives, is only sleeping, and may by courage and sincerity be awakened, to shed healing, spiritual health and the love of her everywhere.

And while the dispassionate critic may regret the venomous vulgarity of certain verses in the book, while he may deplore the pitiable lack of taste displayed in the screeds of cheap satire; yet the dignified and sonorous lines in which Mr. Selwyn Image apostrophises the past beauties and glories of the great historic cities, the floods of Nature imagery in Mr. Whall's verse—verse full of appeal to the spirit of beauty to awake again and "lead with new hope our aimless feet"—to "a fairer scene, where falls the sun on meadows green, while the south-west leads out the lambs to play"—all these things show what was uppermost in the hearts of the masque's contrivers, and the lesson is a fruitful one for every artist.

The imagery of the Sleeping Beauty is sufficiently familiar and universal to make it possible to graft modern meaning on its old-

world stem, and though the joins and grafts are of necessity visible, there was yet unity and congruity in the whole.

The quest of beauty is one which, like the quest of the spirit, must always dominate the hearts of the majority in any healthy nation, and because there are signs that the search was being neglected or carried on without sufficient interest or passion—such a demonstration as the masque has given of the latent possibilities in Art, and Craft, and Architecture, is of incalculable value to the present and the rising generation of artists.

## AT THE GUILDHALL.

London's Guildhall has seldom witnessed a stranger spectacle than that which might have been seen on four evenings last week when the Art Workers' Guild produced their much-talked-of masque, "Beauty's Awakening." If this had been an ordinary dramatic performance, it would have been quite outside the scope of this journal to take notice of it. But it was much more than that; being, in fact, nothing less than the revival of an old art-form, which, though long fallen into disuse, has been associated with some of the greatest of the poets and artists of a former generation. In a spectacle, presented not by actors but by artists, one would naturally look for artistic rather than dramatic excellence. Yet the masque is a form of entertainment so unfamiliar in these latter days that the "presenters and contrivers" were no doubt well advised in prefacing their book of the masque (a beautiful production, by the way) with a few words designed to explain to "the candid and good-natured audience" the true character and meaning of the spectacle they were about to witness. The masque, it is pointed out, is not a play, but a pageant and allegory,

in which poetic and ethic aim, beauty of design and ornament are the important considerations. Without attempting too much realism and illusion, the authors hope to produce "something good in form and colour and fancy, and something perhaps worth thought in allegory and moral meaning." The work, it is admitted, is a patchwork; the workers have wrought (artist-wise) each as his fancy dictated. But this, so far from being a disadvantage, has enhanced the splendour of the spectacle; no single artist, however gifted, would have produced such a succession of beautiful pictures, and any loss of congruity is more than compensated for by the artistic variety that is the product of so many hands and brains, just as a Gothic building often owes so much of its charm to the variety arising from the freedom with which each individual craftsman carried out his own ideas.

It cannot be said, however, that the application of this principle has been equally successful in regard to the libretto, which is a strange medley of good and bad. At times the verses are distinguished by considerable grace and charm, as in the opening rondeau and the verses accompanying the procession of fair cities; at others they are the merest doggerel.

It is certainly a remarkable combination of art workers that has been engaged in this labour of love. Some of the most eminent artists and craftsmen of the day have been hard at work for many months in the designing and fashioning of the dresses and the various "properties," all of which have been produced with an artistic perfection and finish that, if the end sought had been merely commercial success, could only be regarded as an absurd waste of energy.

The stage, designed by Mr. H. Wilson, is different from anything to which we are accustomed in these modern days. It occupies a large space at one end of the Guildhall, and consists of an inner and outer scene, the former representing a forest glade. Above the stage is a broad semi-circular arch supported by Byzantine columns, the capitals of which are enriched with some beautiful designs. A flight of steps leads from the front of the stage to the floor of the hall, and the curtain, which is of yellow silk, is drawn to left and right instead of being dropped in the conventional manner.

The story of the masque has now been so often told, that no doubt many of our readers are familiar with it. It is extremely simple, being based on the old legend of the Sleeping Beauty. Fayremonde, the spirit of all things beautiful, sleeps under the spell of the witch Malebodea; around her are grouped her attendant maids—the Seven Lamps of Architecture—designed by H. Wilson and C. W. Whall. All have fallen asleep and their lamps are out. At length, she is awakened by the kiss of Trueheart, the knight, who has slain the dragon Aschemon, and put to flight Malebodea and her attendant demons. At the conclusion we are shown Fayremonde enthroned by Labour and Invention, and attended by the Seven Lamps and the Five Senses. London, after suffering many things at the hands of the demons, Philistinus, Bumblebeadalus, Slumdum, Cupiditas, Scampinus, Ignoramus, Bogus, and Jerrybuiltus, is at last enthroned opposite Fayremonde, and takes her place as a Fair City among the other Fair Cities.

The action of the story was explained by a Prolocutor (Mr. Selwyn Image), who delivered his lines with considerable elocutionary skill. One scene that appears in the book of words was entirely omitted in performance. It was that in which the demons were in turn denounced in a series of satirical speeches, full of rather vulgar and not very witty topical allusions. There would no doubt be a certain piquancy in the satirising of civic customs and institutions in the presence of the Lord Mayor and Corporation and in their own hall, though it should be said that the authors included many things besides the Corporation in the scope of their satire. There is no doubt, however, that the omission of this scene was a wise decision. Apart from the irritation it must have caused to certain sections of the audience it would have detracted from the

TIME. DRAWN BY R. ANNING BELL.

artistic effect of the whole. The introduction of these up-to-date lampoons must have had a confusing effect, utterly destroying the illusion of mediaevalism, and converting a beautiful old-world pageant into something very like a modern burlesque. Apart from this feature there is very little that is aggressively modern. Although admittedly a thing of shreds and patches, the masque maintains a certain artistic congruity; the music, though it has been criticised by some, was in keeping with the character of the piece; especially was this the case with regard to the music rendered on old English instruments by the party of picturesquely attired musicians led by Mr. Arnold Dolmetsch. Even the book of the masque, with its quaintly worded "Epistle Dedicatory" to the Lord Mayor, maintains the same old English character.

As all the actors were amateurs, it would be unreasonable to expect a very high standard of acting; yet it surely would have been possible to import a little more realism into the combat between Trueheart and the "huge and horrid dragon" Aschemon. Never surely did a beast of such fearsome appearance display so mild a demeanour; he ambled across the stage, receiving the while the spear thrusts of the doughty knight, but concerned apparently for nothing but how to get out of sight before his tail fell off; only by the clanking of his monstrous jaw did he indicate his malignant character. Again, the dance of

the Five Senses would have been far more effective had it been less wooden.

It is, however, as a spectacle that this performance ought to be judged, and from that point of view scarcely any praise could be too high. Each actor, as a rule, designed or made his or her own dress, and every dress was a work of art. A more beautiful stage spectacle than the procession of the nine Fair Cities with their attendants, which Fayremonde is supposed to see in a vision, it would be difficult to imagine. The cities represented are Thebes, Athens, Rome, Byzantium, Florence, Venice, Nuremburg, Paris, and Oxford. Each is portrayed with great wealth of artistic fancy, and the most scrupulous attention to detail.

One of the most striking groups was that of Nuremburg, part of which we illustrate. Nuremburg was personified by Miss Johnstone, in a dull red and yellow robe with a quaint headdress, her train supported by two pages; she was attended by Albert Dürer (Mr. Walter Crane), a stately figure in a scarlet, fur-lined cloak, and a group of craftsmen, each bearing the symbol of his trade. Paris (Mrs. Oakley Williams), in yellow brocade, is preceded by a tiny herald bearing the arms of the city, and is accompanied by Joan of Arc and by St. Louis, while three ladies with arms entwined, symbolising the arts and graces of life, bring up the rear. This very beautiful group was, with the exception of Joan of Arc, designed by Mr. E. R. Hughes. Not less

beautiful was the dance of the Forest Leaves—little girls dressed to represent various coloured leaves, with a gorgeous butterfly in the midst of them—which took place in the first scene.

At the close of the performance all the characters marched in procession round the Guildhall so as to give all the audience a chance of examining the dresses at close quarters. Altogether it was a splendid pageant, and, thanks in large measure to the untiring efforts of the stage manager, Mr. Hugh Moss, it was carried out without any appreciable hitch.

**Changes of Address.**—Messrs. Sanders and Co. and Messrs. Burnham, Williams and Co. have removed to 110, Cannon Street, London, E.C.; and Mr. J. J. Henderson has shifted to the second floor of 7, Ward Road, Dundee.

**The Troon New Graving Dock** was opened last Thursday by the Marchioness of Ailsa. The contractor for the dock and gates was Mr. George Lawson, of Blairbeth, Rutherglen; while Messrs. Drysdale and Co., of Bon Accord Works, London Road, Glasgow, provided the pumping machinery and boilers. The works have been carried out according to the plans and under the superintendence of Messrs. M'Taggart, Cowen, and Parker C.E., of Glasgow.

## ARCHITECTURE: WHAT IS IT?\*

BY JAMES A. MORRIS.

(Concluded from page 310, No. CCXXIX.)

AND now, before ending my paper, I would like to recall to you some little of the story of the building of the great dome of Florence in order that we may refresh our weary souls with the record of a marvellous thing. When the competition for the great north and west doors of San Giovanni had been settled, Filippo and Donatello betook themselves to Rome, the former to study architecture, the latter sculpture. To provide funds, Filippo sold a small farm he possessed, and when the lads reached Rome Filippo stood amazed at the magnificence of its architecture. He at once set about measuring all the work he could undertake—plans, details, cornices—labouring continually in and about Rome, and measuring everything good within reach, sparing neither time nor cost. Beaten in sculpture by Ghiberti, Filippo was possessed of one immense idea, nothing less noble than the completion of the dome of Arnolfo's great church, the Cathedral of Florence, which none since Arnolfo's day had dared to essay. Thus, he should rival the works of Giotto, and Cimabue. To this end, he laboured incessantly; but he did not confide his dream to Donatello, or to any living being. He pondered over the Pantheon, he examined and made careful drawings of the vaults of antiquity, he caused labourers to excavate where they could, till foundations were laid bare, and measured; and the Roman people in derision, yet uttering a truth greater than they knew, called them "treasure seekers." By-and-bye Filippo's money was done, and he supplied his wants by reverting to his old craft of setting precious stones for the goldsmiths. Donatello returning to Florence, left him alone. Consumed now by the fever of work, he neither took time to eat nor to sleep; "he drew temples," says Vasari, "round, square, or octagon, basilicas, aqueducts, baths, arches, the Colosseum, amphitheatres, and every church built of bricks, of which he examined all the modes of binding and clamping, as well as the turning of vaults and arches. In 1407, his health gave way, and he was advised to return to Florence, which he did; rich in knowledge for his beloved project. In the same year, and rumours of this must have reached him, a great assembly of architects and engineers was called in Florence, to consult as to the best means by which the cupola of the cathedral might be raised. Filippo, proposed the raising of a great drum upon the piers, on which would rest the dome, and models were prepared by him accordingly, but in secret; meanwhile he amused himself by helping Ghiberti at his doors. But, as we have seen, Filippo was a man of resource, and, hearing one morning some talk of providing engineers for the construction of the cupola, he quickly betook himself to Rome, rightly foreseeing

that he would be more appreciated there than if he remained in Florence. When, in his absence, the architects and engineers met, they stood confounded and without power to proceed, for they could not conceive of a scaffolding strong enough to carry the whole weight of the cupola till it should be completed. Then was Filippo sent for, and he returned willingly, and, when the authorities were assembled he spoke at great length. Practically, he said, "The work is not yet mine, how then can I recommend what to do?" Then he spoke diffidently of himself and of his powers, and advised that a great meeting of architects from all parts of the world should be held in Florence to advise on the matter, and that whosoever could produce the best scheme should be intrusted with the work. With this proposal the authorities were well pleased, and they called a great meeting of architects from all lands with which they held communion. Meanwhile, as architects had to be summoned from afar, they proposed that Filippo should prepare a model, but unwilling to expose his mind further in the matter, he again, after much entreaty to remain, left Florence for Rome.

In the year 1420, when Filippo was about forty-three years old, the great meeting was held; many opinions were offered. One proposed to raise a mound of earth mixed with small coins, upon which the cupola should be built, and thereafter, that the people should remove the soil for the value of the coins buried therein. Filippo alone declared that the dome could be raised very easily, and without any framework whatever. Whereupon he was laughed at, and told he was mad. But Filippo argued the matter, and pleaded for a double dome, upon which he was once more dismissed, and refusing to leave, he was forcibly carried out by the servants of the place. Filippo's dauntless spirit refused to acknowledge defeat, and what he could not effect before the tribunal, he attempted with individual citizens, and so wrought upon them that the judges, having regained courage, now began to listen to what he had to say. Still Filippo would not expose his model, but proposed, instead, to all, that he who could make an egg stand upright on a piece of smooth marble, should be appointed to build the cupola. When none could make it stand, Filippo took it daintily into his hand, gave the end of it a blow upon the marble, and thus made it stand upright. Beholding this, all loudly protested that they could have done the same, but Filippo, laughing, replied that they might also know how to construct the cupola if they could see his model and design. After much further delay, and he having in the meanwhile built several small cupolas without scaffolding, Filippo was charged with the work; but even then his appointment was accompanied by many restrictions. A colleague was by-and-by proposed, and Lorenzo Ghiberti, the man for whom Filippo, under similar circumstances, had so generously spoken, was associated with him, and at a stipend equal to his own. Meanwhile Filippo caused a complete model to be constructed secretly, which, when Lorenzo heard of, he desired to see; but,

being refused, he became angry, and, that he might not appear to be receiving his stipend for nothing, he commenced a model of his own. Their relationship, accordingly, now became more strained and unsatisfactory than ever, and this vexatious warfare between the two men continued till 1426, Lorenzo's friends meanwhile claiming for him credit equally with Filippo in the raising of the cupola. The building had now advanced to a certain stage, and two things required to be provided—certain scaffolding, and an arrangement of chains for binding the base of the cupola together. Nothing, apparently, being directed regarding either of these requirements, the work practically came to a standstill, and at last, one morning, Filippo did not appear.

Lorenzo, upon being asked for instructions replied, he would not do anything apart from Filippo. Now Filippo was in bed apparently very ill, and when the workmen in desperation appealed to him in his sick chamber he would only say, "You have Lorenzo, let him direct you." At last the wardens in their dignity also visited the sick man and repeated the refrain of the workmen, "Lorenzo will not do anything without you." Whereupon Filippo shrewdly made answer, "but I could do it well enough without Lorenzo." This significant reply sufficed for the time, and Filippo at once recovered. Still, however, Lorenzo had influence and retained power, and Filippo had to seek other means of proving his incapacity. He therefore made this proposal. "The stipend," he said, "is equally divided, now let the work also be divided. Two things yet require to be done, the chainwork and the scaffolding. Let Lorenzo choose one of these works and I will take the other." Lorenzo selected, failed, and was dismissed, with the result that Filippo was at last fully approved. He received a life-appointment for the work and a gift of money. He was thenceforth held in high renown, having achieved the aforesaid impossible; and by his genius and self-control having overcome the malevolence of his enemies, their jealousies and timid fears, he was able to give to Florence her great red

THE ART WORKERS' MASQUE: THE RED DEMON (see p. 322).

heart, which, with the old baptistry and Giotto's campanile, fairer than any white lily of the proud Florentine arms, will for ever form a triplet of stars famous in the firmament of Art.

We have glanced at the training and life of one of the men who achieved the crowning glory of one of these great works. We have seen that in his day, as in our own, were Town Councils and Board of Works. Humanity had much the same of weakness and generosity then as now, and how sore is the travail of an idea, great beyond the reach of lesser minds, we have seen, and how long a time it is before its altitude is scaled. It is the old story of the coat of many colours, in a later age: the dreamer of dreams, the seer of visions—shall

\*A paper read before the Edinburgh Architectural Society.

my sheaf make obeisance to thee? The futile imprisonment of the pit, striving to retard the lofty reach of genius.

Are we yet any nearer an understanding of our question, "What is Architecture?" Look again at the beginning, in Arnolfo's day, of this Florentine cathedral. Here is the spirit in which the rulers approached it. "The Florentine Republic, soaring ever above the conception of the most competent judges, desires that an edifice should be constructed, so magnificent in its height and beauty that it shall surpass everything of the kind produced in the time of their greatest power by the Greeks and Romans." Florence was then entering upon the most brilliant period of her career. Growing rapidly in power and political influence, she was also, by the fruits of a successful commerce, preparing the soil for those seeds which were to blossom forth in that famous school of art and intellect, whose name is divided between the province and the city which gave it birth. Dante was living. Cimabue's picture had already been carried in triumph through her streets, and, in a few years more, Arnolfo would be rearing slowly those mighty walls in the Piazza della Signoria, henceforth to be the new centre of the city's municipal life. But one street distant, and under the same hand, the Duomo itself was growing fair in brick and marble, dwarfing in size the old baptistry in front, but in recompense, clothing it with marble and with gold. A few years later, and by the Duomo's side, was conceived that fair Campanile, twin birth of sea foam and rainbow, dreamed in the brain of Giotto, and by him and his disciples hewn out of all things precious and beautiful. Thus, with many a noble palace and exquisite church, rose the "Fair City of Lilies," in her mediæval grace and splendour; and when the old order changed, "yielding place to new," with it came the majesty of Brunelleschi's great red-robed dome, "a poem and a prayer in one." A century later, as Michael Angelo passed by on his way to Rome, to labour at St. Peter's, he paused, and, looking up at the calm beauty and dignity of its lines, thinking of his own more colossal dome yet to be, he said: "I shall make a sister dome, larger still, but not more beautiful." Reverend words, and noble, truly; such as one great soul may say of another. And Masaccio's own epitaph is no less true of Filippo Brunelleschi:—

He who taught  
All others—Michaelangelo—I taught:  
He designed to learn of me. . . .

Surely, now, having communed with these great men, we may have at least seen some faint glimmering of what Art and Architecture are, and if we thereby fail, like many of them, to achieve in our work, not joy, but wealth, let us remember what was said of Schiller, of whom it is recorded that at the "partition of the earth," finding himself at the end of the general scramble, without a single morsel of plunder, he appealed passionately to Jove, who, pitying him, replied, "The strong and the cunning have seized upon the inheritance of the world whilst thou wert star-gazing and rhyming. Not one single acre remains where-with I can endow thee; but, in revenge, if thou art disposed to visit me in my own heaven, come when thou wilt, it is always open to thee."

**A new Wesleyan Church at Nettleham,** near Lincoln, is in course of erection, memorial stones being laid last week. The site of the new chapel is at the Lincoln end of the village, on what was known as the Bishop's Park. The cost of the building will be over £1,000; the contractor is Mr. E. Mawer, of Louth, and the architects are Messrs. W. Mortimer and Son, of Lincoln.

**Littleborough Church Restoration.**—Funds are being collected to restore the small but interesting church of Littleborough, Notts. The church is a Norman structure of the eleventh century, and in the outer walls of the chancel and nave there are fine specimens of the herring-bone style of masonry. Within the church is a pretty Norman chancel arch. The sum required is £200.

## REGISTRATION OF ARCHITECTS.

### THE QUESTION DISCUSSED BY PROVINCIAL ARCHITECTS.

WITH a view to ascertaining the opinions of provincial architects on the subject of Registration, the Society of Architects have arranged to hold a series of meetings in various provincial centres for the discussion of the subject. Last Friday a meeting was held at the Board Room of the Cutlers' Hall, Sheffield, when a paper on "The Statutory Registration of the Profession" was read by Mr. Ellis Marsland, Hon. Secretary of the Society of Architects. The chair was taken by Mr. T. Walter L. Emden, the President of the Society. Mr. Marsland's paper was as follows:—

I do not propose to occupy your time at any great length this evening, but desire to point out as briefly as possible the main features of the movement we are now met to discuss. Although the question of the statutory registration of the profession has for many years occupied the minds of architects, it was not till the year 1886 that any very definite organisation was determined. In that year, on the 6th of April, a Conference of Architects was called at the Freemasons' Tavern, London, and its views were expressed in the following resolutions:—

"That in the interests of the architectural profession and of the public alike, it is desirable that all architects in the Kingdom should be united in one body, having branches in the provincial cities and towns, and a central council in London, including amongst its members representatives from the provinces.

"That a committee be formed without delay to give effect to the foregoing resolution, and to facilitate the formation of committees in the provinces.

"That it is the opinion of this meeting that instructions should be given to the committee to consider the means necessary in order to obtain an Act of Parliament making it compulsory for all architects to hold a Government diploma."

#### Work of the Registration Committee.

A committee was then formed called the Architects' Registration Committee, to give effect to these resolutions, and after careful consideration they came to the conclusion that in the last of the three lay the essence of the whole. Accordingly, they issued a circular to some 2500 architects in practice in the United Kingdom, with a request that they should sign, if they thought fit, the following declaration:—

"Whereas we, the undersigned, are of opinion that it is for the benefit of the public and the architectural profession alike that legislative powers should be obtained, so that all persons hereafter entering the profession shall be duly qualified by examination, we are desirous that committees should be formed to promote the object in view, and to obtain the necessary Act of Parliament."

Some 1300 replies were received to this circular, of whom 165 were Institute members, and 175 members of the Society of Architects.

#### Engineers and Surveyors,

After the receipt of these replies the committee set to work, with the result that a Bill was introduced into Parliament in 1887, which included architects, civil engineers, and surveyors. This Bill excited the opposition of the two last-named bodies, and it was eventually decided that the Bill should deal only with architects, and a fresh Bill was introduced and was ordered by the House of Commons to be printed on March 7th, 1893. This is the extent of progress that has been made up to the present. Before any further progress can be made it will be necessary to show that there is something like unanimity among architects upon this question, and with the purpose of obtaining the views and opinions of provincial men, whom this question affects much more seriously than men in London, the society which I have the honour

to represent here to-night is organising a series of meetings in the chief provincial centres, that architects may be brought together; and should it be found as a result of these meetings that there is a great preponderance of opinion in favour of registration, we shall, having the knowledge of your support, be encouraged in our efforts to realise the objects at which we aim.

#### Attitude of the R.I.B.A.

We, of course, cannot expect to make much headway with any Bill until we have convinced the Institute that their present attitude is a false and mistaken one, and by these meetings we hope to show them that they are acting in opposition to a large section of their provincial brethren, and also contrary to the best interests of the progress of Architecture in this country. My society has no wish to take the lead in this much needed reform, and if the Institute will but take the matter up in earnest and see it through, they will have our hearty co-operation. Then, with a united front, we shall be able to show Parliament that we are resolved Architecture shall in reality, and not as at present by courtesy, be recognised as one of the professions.

#### What Registration Means.

It may be asked what is meant by Registration? It means, in the present, that every man practising architecture shall be duly enrolled in an official register under an Act of Parliament, and be duly responsible for his professional actions, and that no one be allowed to practise until he has been duly enrolled. In the future it means that no one be allowed to practise architecture until he is duly qualified and has been found so by undergoing a qualifying examination. At present there are only three recognised professions—the Church, Law, and Medicine—to all of which it is considered an honour to belong. And why? Because to be a member of one of them implies the fact of having undergone a prolonged and complete course of study and preparation, which has fitted him for the position to which he has attained. Why is architecture excluded? To possess the knowledge to build, and the skill to plan and design a building, and to deal with innumerable questions—scientific, artistic, legal and sanitary—which continually present themselves in ordinary practice, requires a training as arduous and as prolonged as that of any to which I have alluded. If the men who provide for our spiritual and physical welfare, and those who conduct us through the mazes and intricacies of the law, are to be honoured with the dignity of being called professional gentlemen, surely the men who provide the necessary skill to erect our churches and public buildings, and to make our homes healthy and artistic, are entitled to the same dignity.

#### Builders as Architects.

But the answer is not far to seek. At present any person with or without a fair general education, any builder, builder's foreman, clerk of works, clerk in a local board office, auctioneer, undertaker, *et hoc genus omne*, with the sole qualification of being able to provide a brass plate, is at liberty to advertise himself as a person qualified to give advice to the public in the science and art of architecture. Builders and others going out of their proper province boldly proffer their services as architects to their customers, gratis; and the tempting bait of an apparent saving of five per cent. is not to be resisted. Can it be a matter for wonder that we are still unrecognised while such a condition of things exists? For at present the public have no guarantee that the class who call themselves architects are any better qualified to plan and design their buildings than the contractors who erect them, and should they employ an architect they have no means of ascertaining that his knowledge is greater than that of the builder, and the only certainty about it from their point of view is they will have to pay the professional charges.

#### The Institute Panacea.

Of what use is it for the Institute to say that their examination is a panacea for the existing evils unless this examination is made

compulsory? Until men find, that by undergoing a course of study and passing an examination, they are placed in a better position in the eyes of the public than the man who possesses no qualifications at all, it is very unlikely that an appreciable number of men will voluntarily come forward and avail themselves of this means of entering the profession. The necessity for a higher standard of professional excellence and public confidence is of essential importance to provincial men. There is a feeling—a mistaken one if you will—that local architects are all very well for the ordinary work of the town, but so soon as any work of primary importance is to be executed, architects from outside must be invited to compete. Does not this arise partly from a want of confidence, there being no guarantee in employing a man who is styled an architect that he really knows his business? But in nine cases out of ten it is the local man who, from his knowledge of the materials of the locality and the special requirements of his fellow townsmen, is more likely to carry out the work satisfactorily than an architect from a distance.

#### Advantages and Objections.

The advantages arising from registration are these: (a) Closing the doors to incompetent men; (b) Raising the standard of the profession; (c) Obtaining the confidence of the public and State recognition.

It is not proposed for one moment to say that all who desire to build should employ an architect, but what we do propose is that henceforth, in the interests of the public, no person shall be entitled to call himself an architect whose name is not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect may, by consulting the official register, ascertain what men are qualified. Objection has been urged against the movement that it will create a monopoly, and thus be opposed to the principles of modern legislation; but there cannot be a monopoly created where it is made possible for anyone who proves himself qualified to share the rights. Another objection is that it will be necessary at the outset to register some of the very men who have caused all the mischief. This is very true, and unless you do this you will find that Parliament will not listen to you. That you must respect vested interests is an axiom of Parliamentary practice, and where a man can show that he has practised architecture Parliament will say you must not deprive him of his rights, and the obstinate attempt to exclude this principle from the Medical Act was the chief cause of delaying its passage through Parliament for thirty years.

#### Proposed Registration Act.

The first effect of a Registration Act would be to put a stop to any further increase in the number of incompetent practitioners, and henceforth they would become a diminishing quantity.

The general outline of a Registration Act would consist of—

A preamble, shortly stating its objects.  
A title, which might shortly be the "Architect's Act."

The provision of a general council and branch councils to administer the Act, composed of members of existing architectural bodies, as well as members nominated by the Privy Council and registered practitioners.

A provision as to the appointment of registrars and the necessary machinery for registration.

The qualification for registration at the commencement of the Act, which should include all members of existing architectural bodies, and such other persons as could show, to the satisfaction of the council, that they were actually practising architecture; and, afterwards, only such persons as had been duly articulated, and had passed a qualifying examination.

The provision of an examination, either by the general council or some already existing architectural body.

And, lastly, fines upon unqualified or

unregistered persons practising as architects, and a provision as to their inability to recover charges for professional services rendered.

#### Attitude of the Society of Architects.

A Bill, prepared on the above lines, has been drafted by the Registration Bill Committee, and I take this opportunity to correct an erroneous impression that is abroad, that this Bill is the child of the Society of Architects. That it meets with the general approval of that body is no secret, but the Society is by no means pledged to it in all its details; it may be necessary to amend it in some particulars, and the object of this meeting is to elicit the opinion of architects on the general question, and not upon the details of any particular Bill. The time may come when, with certain modifications, the Society of Architects may adopt it, but not until the general sense of the architectural profession has been declared definitely in favour of the principle. If architects want such a measure this Society will leave no stone unturned to bring about its realisation. If, on the other hand, the general feeling is against any registration scheme, we shall be content to let the matter drop. Gentlemen, the matter is in your hands.

## Keystones.

**The First Stone of a new Hospital at Boscombe** was laid last Wednesday by Mr. W. B. Beach, M.P. The hospital will cost about £10,000.

**A New Wesleyan Chapel at Clapham.**—The foundation stone of a new Wesleyan chapel in Broomwood Road, Clapham Common, was laid last Wednesday. The building is estimated to cost £10,000.

**The Queen's Hotel, Southend,** was opened last week. Messrs. Thompson and Greenhalgh were the architects, Messrs. Symes and Co. were the general contractors, and the Rural Decorations Company decorated the ceilings. The building is of red stone, with Bath stone dressings.

**A Fatal Accident to a Steeplejack** occurred at Bridge Mills, Tintwistle, near Manchester, last Wednesday, by the fall of some of the stonework of the main building of the mill, which was being demolished. Two other steeplejacks received severe injuries. The name of the dead man is Eli Jones.

**A New Free Church** is to be erected at Linthouse; the memorial stone was laid by Mr. and Mrs. John Stephen. The estimated outlay is £7,800. The church will accommodate about 1,000 persons, and there will be a hall to seat 300 persons, a session house, a ladies' room, a church officer's house, and other accommodation. Mr. James Miller is the architect.

**The William Morris Labour Church** at Leek is a form of memorial to the late William Morris, of which he would have heartily approved. The church, which was founded in December, 1896, and is supported mainly by working people, is in financial difficulties, and an effort is being made to wipe out the present debt and provide funds for the future. Perhaps some of our readers who sympathise with the artistic, social, and ethical ideals of the great artist craftsman will like to take some practical part in this effort. The treasurer is Mr. Larner Sugden, F.R.I.B.A., of Leek.

**The Enlargement of the Parish Church at Kilbirnie** was the subject of considerable discussion at a meeting of the heritors and owners last week. Plans of alterations and improvements prepared by Mr. Charles S. S. Johnstone, of Edinburgh, were submitted, and the following resolution was agreed to: "That in the event of the kirk session collecting and consigning in bank sufficient money to meet the offered cost of the proposed extensions and alterations, and a guarantee being given by the members of the kirk session and others for the sum of £300 in excess of the offered cost, the heritors undertake that the permission asked in the application should be granted."

## Enquiries Answered.

*The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.*

#### ARTIZANS' DWELLINGS.

To the Editor of THE BUILDERS' JOURNAL.

DENBIGH.

DEAR SIR,—I shall be greatly obliged if you would kindly give me the numbers of the BUILDERS' JOURNAL or any of your publications, in which drawings and details of artizans' dwellings are given.—Yours faithfully,  
S. T. M.

A series of articles on "The Planning of Small Houses" appeared in our issues for Feb. 10th, and 17th, March 10th, April 21st, May 19th, and June 23rd, 1897. These articles, which are from the pen of Mr. H. V. Lanchester, A.R.I.B.A., will probably be of use to you. Designs for small houses also appeared in the numbers dated Sept. 2nd and Nov. 11th, 1896, and March 30th, 1898.

#### RIGHTS OF LIGHT, &c.

To the Editor of THE BUILDERS' JOURNAL.

KIDDERMINSTER.

DEAR SIR,—I should be glad if you would kindly reply to the following queries in the next issue of your valuable paper:—(1) I have a small freehold cottage which I live in, and on the next plot of ground the neighbour has built against the gable a boarded shed which is used as a blacksmith's shop, and, of course, is a great nuisance. Can I compel him to remove it, or what can I do? (2) A window has been put in a gable overlooking my property one yard from the boundary. How long takes it take to have a right to the light?—Yours, &c.  
G. J.

(1) Yes; if the gable belongs wholly to the owner of the cottage. If it does not, e.g., if it is a party wall, No. The use of the shed as a blacksmith's shop may be legally a nuisance, which can be prevented by injunction. (2) Twenty years.  
H. P. B.

#### RIGHT OF OWNER IN REGARD TO DRAINAGE.

To the Editor of THE BUILDERS' JOURNAL.

DAERMOUTH.

SIR,—A dwelling-house with the entrance at the back, and the basement storey situate under the roadway, has the upstairs w.c. joined to the public sewer; but the bath, servants' w.c., scullery, sink, etc., being below its level empty into a cesspit. This is such a nuisance that the owner wishes to connect with the sewer which runs down a hill at the side, but a plot of land owned by another person intervenes. Has the owner of the house a legal right to carry this drain through his neighbours' land without his consent? W. C. H.

The answer is in the negative. The owner has no such right.  
H. P. B.

**New Pathological Block, Oxford.**—The University authorities have sanctioned the plans of a pathological block in connection with the University Museum. The total cost is estimated at £10,000. The architect is Mr. J. Augustus Souttar, 61, Gracechurch Street, E.C.

**A Crane Accident** occurred recently which resulted in the death of one man and the severe injury of two others. The accident happened at a building in the course of erection at Falkirk. While a portion of a hand crane was being swung off a scaffolding by a steam crane, the jib of the latter unaccountably gave way and fell and broke into two pieces. John Gunn, a joiner, was killed by the falling jib, and J. McKay, a joiner, and E. McCue, a labourer, were injured.

## SOME CHURCHES IN NORTH-EASTERN LINDSEY.

BY J. J. CRESWELL.

ON the fringe of low-lying land between the Wolds and the last wide silt-laden reach of the Humber, on the border of the hill-land, yet not in the marsh, is a small group of Early Churches, differentiated both from the reputed Anglo-Saxon (? Scandinavian) of the old Church of Barton-on-Humber on the one hand and from the pure completed Norman-Romanesque of Lincoln (west front) Stow, or Rothwell on the other. Access to this district from the more fertile and settled parts of England was difficult in early times from the landward side, as it lies some twenty miles

The churches above referred to are those of Clee, Scartho, Holton-le-Clay, and Brigsley, and perhaps St. James', Grimsby, though this has been so much rebuilt, mainly in the thirteenth and early sixteenth centuries, and again so largely altered in the middle of the eighteenth and restored in the latter nineteenth, that but little of the pre-Norman or Norman work remains. Besides, this is not the church of Grimsby proper, but of the priory of Wellow. St. Mary's, the old parish church, of which no vestige now remains, it is permissible to suppose was more conformable to the peculiarities of the group we are about to describe.

With no durable building stone in the immediate neighbourhood, land-carriage impossible, with few and bad roads, mere tracks for the most part, water carriage equally unavailable from the prevalence of local pirates and foreign marauders, these churches, with the exception

in the reconstructed churches, and are always pointed out as evidence of such a catastrophe.

So far as any of the original plans can be reconstructed from present remains, the churches consisted of a small plain nave and a somewhat narrower though proportionately longer chancel, square ended at the east. The apse, that survival of the Greek and Roman theatre, is not found in this district, nor anywhere nearer to it than Lincoln, where its foundation-walls still exist beneath the floor. The cruciform plan with a central tower is almost equally unknown (the transepts at Clee, as we shall see, are a later re-building.) The tower is at the west end, whence it commands the nave, and on the three remaining sides the open country round.

In the case of attack the tower would be the

eastward from Ermine Street, the great Roman road to the Humber Ferry at Winteringham, while it is but skirted by Barton Street, that presumably more ancient, if less frequented, British ridge-way which follows the lower escarpment of the hill-land from Louth to Barton. On the other hand it lies open to the sea, and to the Humber Roads; it had its own ancient port of Grimsby, and felt the full tide of successive invasions, warlike and peaceful, of Saxon, Angle, and Dane, whose race, place-names, and tongue (those of the last-named especially) still characterise and distinguish Lindsey and Holderness (the corresponding district of Yorkshire on the north bank of the Humber), from the other parts of Lindum-Colonia and Northumbria.

Direct Roman influence such as we can almost believe we trace in Lincoln, is imperceptible in these churches, and there is nothing in them which will compare for interest and elaboration with the strip-work angles and arcades, and the baluster window-shafts of Barton-on-Humber. Yet something has filtered in of both influences, modified by local circumstances.

of the towers, were not so built as to last intact to our day. The towers have best stood the test of time and accident, by mere weight and bulk, and give us an idea of the construction of the rest of the fabric. Their walls, 4ft. thick in the ground story, are of sea-pebbles, chalk, and friable sandstone, well enough for work of this thickness, but quite explaining the disappearance of the presumably lighter-constructed body of the church. It is allowable to suppose that often this last was of wattle and clay, with thatched roof, like many a country cottage to this day; the rude construction of the towers was certainly hidden by plaster, of which extensive patches still remain, and clay-work would require the same protection.

To be burnt by Danish marauders was according to tradition the usual fate of a north Lindsey church, and all the churches named (Grimsby excepted) show signs of this. The sandstone, which contains a considerable portion of iron, has in many places been burnt red, greenish-brown being its natural colour. These discoloured stones have been rebuilt

stronghold of the church and possibly of the village also. Tradition still points out a stone said to have been flung by Grim, the semi-mythical founder of Grimsby, from the tower of the church (the older one referred to, it must have been) at an invading fleet, or, according to another version, among a body of revolted natives.

These towers are all accordingly strong, simple, and nearly detached, with few and small openings, without staircases, and doubtless flat roofed. The original roofs have long since decayed, but the majority of the Marsh churches have low, square towers to this day, the pinnacles hardly relieving the simple flat-topped outline, as if this form had arisen from the constant use of a flat defensible roof at first for very practical reasons, and had afterwards become traditional. All these considerations would lead to the conclusion that these towers date from the times when Danish invasions of our eastern coast were to be looked for and guarded against; and as these incursions ceased after the Norman Conquest, the towers belong to the Saxon period—are, in fact, Saxon

PLAN OF CLEE CHURCH.

towers. Some further justification for the application of this name will be brought forward later on in considering some of their details.

The tower of Cleve Church is the best example of the above-named peculiarities. Its original height (the upper part has been rebuilt above the belfry windows) seems to have been about 50ft., or  $2\frac{1}{2}$  squares, it being 20ft. wide at the ground. On the ground floor are three openings only, a small loop light on the south side, 9ft. from the ground; the western doorway, a plain, unmoulded semi-circular arch, 30in. wide by 7ft. high; the arch into the nave, 6ft. 9in. wide by 16ft. 6in. high. Both the latter arches go right through the whole thickness of the wall, tunnel fashion, without recessed arch rings; the western doorway has a rude projecting impost and a rough label moulding; the inner arch has impost and two sets-off at the foot, on the soffit side only. The second story has one opening only, a keyhole shaped window, i.e., a narrow slit having a horse-shoe arch cut out of one stone, 6in. wide by 3ft. 3in. high over all, with no provision for a shutter or glass, in this respect resembling the loop-light below, with one long splay from the outer to the inner face of the wall, where it widens out to 3ft. The second story is finished by a plain chamfered sandstone string course, above which the wall sets off about 6in. on the outside and 9in. on the inside. Standing on this string, which is the only break in the plain wall surface from the ground upwards, are the belfry windows. These are in pairs and are of the mid-wall-shaft type, a single column standing in the centre of the thickness of the wall with a cushion capital, supporting in its turn a long impost stone going through the entire thickness of the wall which carries the two arches of the double window. These have rough chamfered imposts, but otherwise the arches and jambs are like those of the ground story, and go through the wall without set-off or splay, perfectly square and plain. The arches are about 1ft. 3in. wide at the springing, and are 6ft. in clear height above the string-course on which the windows stand.

This type of belfry window is undoubtedly Saxon. Mr. Tavenor Perry, in his paper read before the Royal Institute of British Architects (Journal, February 26th, 1898), has traced this pattern to Rome, from which our early civilisation was directly derived. There is nothing like these in work known to be purely Norman, where the windows and arches are derived also from the Roman, but more developed and differentiated, and of greater refinement and elaboration.

The lower part of Cleve Tower is of sea-pebbles, or "cobble-stones," with small quoins of sandstone up to the middle loop-light: of

rough sandstone rubble the rest of the height. Just above the arches of the belfry windows runs a band of two courses of freestone ashlar, as if to bond the imperfectly bonded sandstone. This and the work above it, including the parapet and eight pinnacles, are apparently fifteenth or late fourteenth century work, with nothing remarkable about them, except that two battlement copings on each face are

adapted springing-stones of groining, presumably of some vanished part of the church, but of such part there is no vestige. The south doorway, with its original wooden door, is of the same date as the parapet, so it may be that an earlier groined porch was here, and these springers are the only fragments of it remaining.

The above description of Cleve Tower applies also in general to the towers of Scartho, Holton-le-Clay, and Brigsley, which need not here be mentioned in further detail, except to say that Brigsley belfry has been entirely rebuilt in the fifteenth century. About this period heavier and more tunable peals of bells began to be more common than in the earlier times, and to this development of bells and bell-ringing we owe not only so many late belfries on earlier substructures, as at Lincoln and Wells, but the whole of many lovely towers, sometimes with accompanying spires, as at Boston, Louth, Coventry, and Canterbury.

Dismissing first the less interesting of the churches mentioned above, Brigsley calls for no special remark. A nave that has once had a south aisle now perished, and the arcade walled into the south wall of the nave, and a small chancel make up the plan. The chancel has a low side-window now blocked up, and some interesting little windows showing the transition from geometrical to flowing tracery. No illustrations of this church are shown. Grimsby Church cannot be called uninteresting, being a fine twelfth and thirteenth century cruciform structure, some 160ft. from east to west, but it does not fall into the group above marked out, except by a fragment of rude masonry in the west front and the Transitional doorway shown in the plate, which takes a position midway between the late Norman and the pure Early English of Cleve. Scartho tower is like Cleve, and is in much the same

state, the principal alteration being the insertion of an Early English doorway in the south side. Beyond this the arcade illustrated is the only part of the fabric of any interest, the remainder having been entirely rebuilt in a not very admirable style some fifty years since. The details of the arcade seem all of an Early English type, but a later feeling comes in the circular stops to the arch splays on the centre pillar, which bring the outline of the arch where it dies on the cap, to follow the quatrefoil outline. This would date it somewhat forward into the Early Decorated period, where this device for softening the abrupt junction of archmould and capital first began to be used. The way the terminal of the western respond-cornel is drawn out fine and tied in a knot is curious. A hideous head of the date of the restoration has been inserted under the other cornel. It might have been finished as a flat circular soffit with a rosette or inter-laced triangles sunk therein as are some similar respond cornels in the neighbourhood.

The fonts of both Cleve and Scartho are of a simple circular tub-shape and are apparently as early as anything in these churches. The former is decorated with a small rude cable-moulded-band, the latter is quite plain.

Cleve Church is the last and most interesting to be noticed. However isolated the original church may have been before the Conquest it early felt the influence of the invading style. The original nave had low walls, no arcades, and high-pitched roof, the marks of which, but without a weather moulding, can be seen on the eastern face of the tower; the chancel was doubtless equally plain. The north arcade presents a curious problem. Was the westernmost arch the old chancel arch? It is more elaborate in all its details than the remaining two; it is not a true semi-circle, having been apparently reduced from a larger arch, as is also shown by the imperfect and fragmentary keystone. A large "beak-head," apparently the stop of a perished label-mould is preserved in a position suggesting such a previous use for it, the eastern impost is discontinuous from that of the adjoining arch, and the bond of this pier is very imperfect. The remaining arches are simpler, but are worked to correspond generally with the westernmost.

The south arcade is of the later Norman style; if the northern may be dated as of the time of Bishop Remiguis, of Lincoln, this may be put down as of his successor, Alexander. The little canopied niche on the eastern respond is, of course, a late insertion, probably fifteenth century. Set into the cylindrical pier is a tablet with one of the most interesting architectural inscriptions known in England, which gives us the date not of this particular pillar, but of the later completion of the entire transformation to the double-aisled, cruciform church towards which this was a step. It is translated as follows:—"This church is dedicated in honour of the Holy Trinity and the Blessed Mary, on the seventh of March, by the Lord Hugh, Bishop of Lincoln, in the year from the incarnation of our Lord MCXCII., the third of the reign of King Richard."

On the south face of the eastern respond is a fragment of string-course, showing this to have been the external face of the original south wall.

The north aisle is narrower than the south, and its wall thicker, with a considerable internal batter, leaving no doubt as to its being the earlier of the two; in both of these fifteenth century windows have been inserted.

The earliest work of Saint Hugh is evidently the arch opening from the north aisle into the transept. The jambs show the "bottell" shaped shafts, the abacus and the upper part of the bell of which remain square, but the bell is not under-cut, being a plain, flat surface, into which the bottell-shaped portion below dies. The mouldings are rude and coarse. The corresponding arch on the south is much improved both in design and workmanship, the bell is undercut, and the mouldings are finer. The remaining arches of the crossing are all similar in detail, except that in the chancel arch and the arch next the nave the square abacus and cap are abolished, and

both follow concentrically the outline of the shafts below. These arches form in their way as interesting an instance of the development of the Early English style as does Saint Hugh's work at Lincoln.

Within the south doorway on the eastern side is a stone pedestal about 3ft. 3in. high, with a shallow sinking on the top, once apparently deeper; it is doubtless the remains of an ancient holy-water stoup. Sunk in the face of the upper portion is a Maltese cross in a circle.

Before the restoration of 1879 a low roof covered the entire church from end to end, including the central tower; this has now been raised above the roof and lantern lights have been inserted, and new high-pitched roofs put on. The chancel and transepts have been largely rebuilt; the vestry and south porch are new.

## Professional Practice.

**Burton-on-Trent.**—The ceremony of laying the foundation-stone in connection with the workmen's cottages to be erected by the Burton-on-Trent Artisans' Dwellings Co., Ltd., on a site in the rear of Wyggoston Street, was performed last Wednesday by Captain Ratcliff. The chief door of each house will open from the front of the street, and entrance will be at once obtained to the living room, which will be 12ft. square, and will have a boarded floor. The kitchen—11ft. by 9ft. 3in.—will be approached from the living room, and will be properly appointed. From the kitchen entrance will be obtained to a good pantry, and the staircase entrance will also be from the same room. The chief bedroom will be 15ft. 6in. by 12ft., and the second will vary in size somewhat, but all will be of good proportions. There will be a linen closet for each of the small bedrooms. The out-offices will be in every way suitable, including the provision of w.c.s. The yards will be paved with blue bricks, there will be an entry to every two cottages, and each two will be walled in. The fronts of the cottages will be finished with the best pressed red facing bricks, and the roofs will be covered with best red tiles. Each cottage will be built on a concrete foundation. The architect was Mr. Thomas Jenkins, of 35, High Street, Burton-on-Trent.

**Dundee.**—A new U. P. church is to be erected, which will accommodate 700 persons. There will also be two halls seated for about 350 persons, session and managers' room, ladies' and gentlemen's cloak rooms, lavatories, etc. The style adopted for the new building is a free treatment of Gothic of the Perpendicular period, the square tower being relieved by slightly projecting buttresses and finished with battlemented cope and square turrets. A very large traceried window is introduced in the front in order to get full advantage of the light. There are two entrances, both of which lead directly into the area of the church, while the entrance through the tower also leads to the gallery and halls below. The stone dressings of the front elevation will be of red stone, while the infilling will be of a local stone of suitable colour to give the necessary light and shade. The side and back elevations, although plain, have an outline of an ecclesiastical character without going into ornamental detail. The plan is arranged in one large nave, side aisle, and transept, with an end gallery. In one of the bays of the transept are placed the organ chamber and choir gallery. The pulpit and platform are placed on the south wall, partly in an apse or pulpit recess, and are lighted by windows at each side. Large traceried windows placed in the nave and transept run up into the roof above the wall head to secure better light, and this arrangement is an architectural feature of the building. A subsidiary staircase is situated in the west transept leading to the vestry and choir gallery, also making a connection with the halls below and special exit to the Cowgate. The plans are being prepared by Mr. T. Martin Cappon, F.R.I.B.A.

The High School of Dundee has had a new laboratory erected upon a part of the back playground. The room measures 44ft. by 36ft., and is well lighted from the roof, and by four windows which look out on the playground. It is substantially fitted with benches and tables, accommodating 40 students working at one time. Mr. R. Gauldie, of Panmure Street, was the architect, and the contractors were:—Mason work, Mr. John Duncan; slater work, Messrs. J. Laburn and Son; plaster work, Mr. Alex. M'Ritchie; joiner work, Mr. Wm. Philip; plumber work, Messrs. Farquharson and Son; painter work, Mr. Wm. Norwell; heating apparatus, Messrs. G. H. Nicoll and Co.; and electric lighting, Messrs. Muckersie and Vandore.

The offers of the following tradesmen for the different departments of work connected with the villa to be erected, from designs of Mr. J. Sim, C.E., Montrose, at Sunnyside Asylum, which the managers some time ago resolved to build with the view of relieving the pressure on the main building of the Royal Lunatic Asylum, have been accepted:—Mason, Mr. Archibald M. White; builder, Mr. Lundin Links, Largo; joiners, Messrs. Pettis and Stephen, Montrose; plasterers, Messrs. Sellar and Co., Aberdeen; plumbers, Messrs.

C. Wood and Co., Montrose; slaters, Messrs. Brand and Son, Arbroath; tilers, Messrs. Burness and Son, Montrose; asphalters, Mr. W. Briggs, Dundee.

A very successful bazaar was held in March last with the view of raising funds for a manse in connection with Knox's U. P. Church. A site had been secured on the west side of Bridge Street during the ministry of the late Rev. Alexander Campbell; plans prepared by Mr. Sim, C.E., were approved of; and the offers of the following tradesmen have been accepted:—Mason, F. Brown; joiner, J. Davidson; plumber, C. Wood and Co.; slater, J. Keillor and Son; plasterer, Burness and Son—all of Montrose.

**Hull.**—In consequence of the widening of Prospect Street, which will make it one of the finest streets in the city, the proprietor of the Prospect Inn commissioned Mr. John M. Dossor, A.R.I.B.A., of 2, Manor Street, Hull, to prepare designs for the reconstruction of the inn. The above illustration is Mr. Dossor's design. It is proposed to build the lower storey in buff terra-cotta, the upper storeys in stucco, and the roofs tiled.

**Norwich.**—The foundation of St. Peter Mancroft Mission Memorial Hall was laid last Thursday by the Mayor of Norwich. The style of the building is in harmony with that of the vicarage, domestic, having crow step gables and Gothic-headed windows with mullions of Cossey brick. The front will be relieved with panels, one having a text in raised letters and one in the apex with the cross keys of St. Peter. Accommodation will be provided for about 230 persons, not including the platform, with two class-rooms, each accommodating twenty persons. Heating will be provided by small-bore apparatus and

**Reigate.**—The schools here illustrated are the new church schools at Sidlow Bridge, near Reigate, Surrey, which have been erected by Mr. A. H. Ryan Tenison, A.R.I.B.A., and Mr. Edward Thornton, A.R.I.B.A., of 7, Great College Street, Westminster, for the Rector, to take the place of the existing schools condemned by the Education Department. The ground was very generously granted by Mr. Ralph Clutton, who took much interest in the building, and it is greatly due to his wishes that so picturesque a building has been erected. The schools contain accommodation for eighty-eight scholars and teachers, and have a main

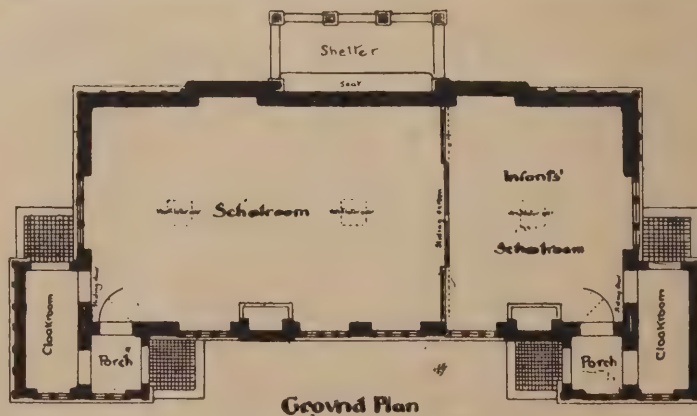

made moulded bricks as cappings, &c. The smith's work throughout was specially designed for the works, which were carried out by the late Mr. Daniel Debenham, of Betchworth. It is proposed to erect the school keeper's residence at a future date within the area of the ground conveyed by Mr. Ralph Clutton.

**The Victoria Tower at Huddersfield**, which has been erected to commemorate the Diamond Jubilee, was opened recently by the Lord-Lieutenant of the West Riding, the Earl

radiators, and the electric light will be installed. The sanitation is provided by Boyle's apparatus. The building is being erected in accordance with the plans by Mr. C. S. Beck. The cost is estimated at £1,237.

**Oxford.**—The designs by Mr. T. Augustus Souttar, of London, for the erection of a new pathological building in connection with the University Museum have been approved by the University authorities. The buildings have been planned on the central hall system, and will consist of three storeys. The basement, which will be half sunk, will provide accommodation for a workshop, attendants, heating and refrigerating room, and stores. On the ground floor will be a museum with a gallery, a lecture theatre, and bacteriological, chemical, and balance rooms, as well as private rooms for the lecturer, with lavatory accommodation, &c. The first floor will be composed of bacteriological, practical, preparation, photographic, and assistants' rooms, and, in addition, there will be storage accommodation in the roof. The central hall will be continued through the upper floor, with a gallery round it. The cost of the building is estimated at £10,000.

SIDLOW BRIDGE SCHOOLS, NEAR REIGATE. ARTHUR H. RYAN TENISON, A.R.I.B.A., AND EDWARD THORNTON, A.R.I.B.A., ARCHITECTS.

schoolroom and an infants' room with separate entrances and cloak-rooms with offices at the rear. The building is in the half-timber style with rough caste filling in, red tiled roofing, and an oak shingled bell cote. The brickwork is executed in local red facings, with purpose

of Scarborough. It has cost over £3,000, and is built of Crossland Hill stone. It is 20ft. square, and 100ft. high. Mr. Isaac Jones, of Deerbrook Road, Herne Hill, London, S.E., is the architect, and Messrs. Ben Graham and Sons, of Huddersfield, were the builders.

## Bricks and Mortar.

July 5th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### Rodin the Great.

WE learn that M. Rodin, the gifted French sculptor, will not show his works with his fellow sculptors at the Paris Exhibition of 1900. He has been conceded at his request a place at the junction of the Avenue Montaine, and the Cours-la-Reine, just by the Place de l'Alma. A special pavilion will be built on purpose. Visitors to the Exhibition will elsewhere be able to study the works of other sculptors of the Modern French School massed together, but in order to see the work of M. Rodin, they will have to go some distance. Perhaps M. Rodin thinks that the sight of his work would cause injury to his fellows.

IN contrast to the action of Paul Dubois, M. Rodin, a ceremony took place last Monday week which shows the much more usual good feeling prevalent among French artists. This ceremony was the presentation of a gold medal to M. Paul Dubois by MM. Chaplain, Falguière, Frémiet, his colleagues of the Institute, and MM. Bartholdi, Boisseau, and Boucher, to show their appreciation of his statue of Jeanne d'Arc, shown in the Salon of 1895. The medal was presented by M. Frémiet, the author of that other masterpiece, the Jeanne d'Arc in the Place des Pyramides, Paris. The medal was the work of M. Chaplain, and showed M. Dubois' portrait on the one side, and on the other Jeanne d'Arc with the date 1895.

### Central School of Arts and Crafts.

AN exhibition of considerable interest will be opened to the public at the Central School of Arts and Crafts, 316, Regent Street, opposite the Polytechnic, on Monday, July 10th, and remain open throughout the week from 12 (noon) to 5.30 p.m. daily. The work done by students includes: Book-binding, silversmiths', goldsmiths', and jewellers' work, chasing and engraving, enamelling, stained glass, ornamental lead work, stone work (by architects), woodcuts in colour (by a method based on Japanese practice), embroidery, wood carving and gilding, &c., also modelling and designs for various processes. Admission will be free. The school was established in November, 1896, by the Technical Education Board of the London County Council to meet a definite want—viz., to provide for apprentices, journeymen, and others engaged in the more artistic trades, such training, subsidiary to the workshop, as each student may require in relation to his special craft. Admission to the school is, within certain limits, restricted to those actually engaged in these trades, and no attempt is made to provide for the amateur student of drawing and painting. The school is exceedingly well equipped with all appliances for carrying on practically the crafts embraced, and with fine examples of old work to serve as a stimulus. The staff is composed

of specialists of distinction in their particular subjects, working under the general direction of Mr. G. Frampton, A.R.A., and Mr. W. R. Lethaby.

### What the School has done.

DURING the third session just completed, the school has been very successful, not only in attracting students (nearly 600 having been in attendance), but also in the quality of the work done, in which there is a distinct advance upon last year. At the general competition in March last for art scholarships and exhibitions offered by the Technical Education Board, open to all art

and great moat apartment is to the left of this hall, with a very fine window in the gable next to the north porch on the same elevation as this bay window. The whole of the late work is very fine, the jambs richly moulded, and the windows nearly all with tracery, all of one date. The manor suffered in the wars of 1643, when it was taken by storm (probably by the Royalists).

### The Whole Art World Is Aghast.

MR. EDWARD S. PRIOR ably expresses the prevalent feeling on the decoration of St. Paul's Cathedral in a very interesting article in the July number of the "Architectural Review."

BAY WINDOW AT WINGFIELD MANOR. DRAWN BY E. BECKITT LAMB.

schools and classes in the London area, no less than forty-seven awards out of a total of 150 were made to students of the Central School, to the work of which special commendation was given in the report of the examiners, Sir W. B. Richmond, R.A., and Mr. Selwyn Image. The students appreciate and profit by the facilities given them for gaining an all-round view of their crafts, such as is no longer possible in the rigidly subdivided workshop. Within the limits of the present temporary premises, no great development is to be looked for; but a small class for ornamental writing (suitable for illuminated addresses) is contemplated for next session, which commences on September 18th. Full information as to this or any other classes can be had on application to the curator at the school.

### Wingfield Manor Bay Window.

THE view here given shows a bay window on the north side of the quadrangle. It would seem to have lighted the hall together with a row of rich traceried windows, probably of similar pattern; but none of these now remain, except their ruins. The chapel

tural Review." He says that "the whole art world is aghast at what the nineteenth century artist is doing at St. Paul's. He has been made free of it, and his brethren shake their heads and hold up their hands. To try and stop him representations and protests are poured in upon the Dean and Chapter; noble lords are conjured to call on Government to interfere; deputations from academies and institutes claim to be heard; and where Academicians have hesitated, Slade students, *en masse*, have rushed in with vigorous condemnation. It would seem as if never artist's work had met from artists such unanimous disapproval; even Mr. William Richmond's friends keep silence from praising." Mr. Prior says that "to chip and be-marble Wren's stonework; to embroider when he left plain; to emphasise what his art made subordinate; and think to doctor the contour of Wren's mouldings—to do all that Sir William has done, and would do—is to be no Decorator with a painter's sense (however it be boasted to distinguish itself from Puritanism), but is, as a would-be Architect, to quarrel with Wren."

### Wren thrice Be-littled.

THE author of this article on the burning question of the decoration of St. Paul's, asks the question, "How comes it that our London Cathedral should be handed over to such hostile—or, at any rate, unsympathetic—hands? Three times this century have there been tamperings with the dispositions of Wren's choir: first, the organ was taken from its place, and split in two; secondly, a reredos erection was attempted; and thirdly, have now walls and ceilings been painted and faced with mosaic. And each of these changes has be-littled Wren's architecture, and left us a less precious possession in it. Still, in the dome and the nave there is much of the great Wren to save, if the Dean and Chapter will save it." Mr. Prior remarks that the Dean and Chapter have asserted in authoritative tone their "knowledge and love" of their cathedral. "But similarly professed were they who broke down the great chapter-house of Durham, and would have removed its Galilee; who gave Wyatt the mandate to destroy so much of Salisbury; and they who passed Wells over to Salvin, Worcester to Perkins, Chester to Scott, and lately St. Albans to Lord Grimthorpe, and Westminster transept to Pearson. Surely at the hands of "knowledge and love" has at Cambridge been be-smirched the most beautiful relic of its ancient history, the old King's Gate; and at Oxford have been cut down from their pedestals the statues of St. Mary's." The remains of our ancient arts, he says, have now become few enough, and the scantiness of the fragments brings all on to an equality of preciousness; all should be scheduled out of reach of their temporary possessors, "So that no more may 'knowledge and love' expose a St. Paul's to the mistaken hardihoods of a Sir William Richmond—nor any other Sir William Richmond be tempted to that painter's disloyalty in art which would think to repaint an ancient master."

### Fire Tests.

THE arrangements of the British Fire Prevention Committee for July include the following series of fire tests:—The fire resistance of casements glazed with patent wire-glass, by Messrs. Pilkington and Co., of St. Helens. The fire resistance of skylights glazed with patent wire-glass by the same firm. The non-flammability of a matchboarded partition, constructed by the British Non-Flammable Wood Company. The fire resistance of a matchboarded partition, with silicate cotton filling, constructed jointly by Messrs. Anderson and

Messrs. Broadbent. The fire resistance of a ceiling, constructed jointly by the same firms. The automatic recording of an outbreak of fire on the Pearson Automatic Fire Alarm System. The fire resistance of a 2in. solid partition, constructed by the Mural Decorations Company. The comparative fire resistance of ordinary glazed sashes glazed with 32oz. glass, plate glass, and lead lights respectively. The comparative fire resistance between a 2in. solid oak door and a 2in. solid oak door. These tests will be carried out according to the usual procedure of the committee at their testing station near Regent's Park, and the official reports are issued about four weeks after the respective tests take place.

### A Station under a Church.

ONE hundred feet below the level of the road near the Mansion House, and just under the quaint church of St. Mary Woolnoth, which is at the corner of Lombard Street and King William Street, a big engineering feat has been carried out. In 1893 the City and South London Railway Company obtained an Act of Parliament to construct an extension of the line at present running from the Monument to Stockwell, so as to carry the line to the Angel, at Islington. The idea was to cross the river by another tunnel near London Bridge, to proceed under King William Street, past the Bank of England, up Princes Street, then under Moorgate Street, Finsbury Pavement, and the City-road, terminating at a point near the Agricultural Hall; a future development being a continuation of the line under the High Street, Islington, so as to join up the system with that of the North London Railway at Highbury Station. For the Lombard Street Station the Act gave power to acquire the church of St. Mary Woolnoth, to demolish it, and to construct the necessary building upon the site. The works were not commenced within the stipulated period, and when the company applied for an extension of time in 1896, Parliament changed its mind, and would only give them the right to use the subsoil and to construct their station under the church.

### How It Was Built.

How to erect the station under the church was a difficulty which tested the powers of Sir Benjamin Baker and Mr. David Hay, the engineers to the railway, but they proved themselves fully capable of overcoming the difficulty, and, although the church has been completely disconnected from its foundation, and rests solely on massive iron girders, not a

brick has shifted, nor have the Corinthian columns suffered from the underpinning. The four iron girders used for supporting the four groups of columns which carry the roof were fixed in position, and small needle girders were then threaded through the bases of the columns. It was found on piercing the bases for this purpose that the inside of the columns was not solid stone, but inferior brickwork with a stone casing of from 6in. to 9in. thick. To overcome this difficulty a continuous sheeting of steel joisting was placed under the whole area of the bases, and loose masses of brickwork had to be tied together, and the weight equally distributed upon the needle girders. To support the south wall it was pierced at intervals of about 5ft., and strong needle girders were run through, one end resting on solid stone on the outside, and the other fastened to the main girder supporting one of the columns. After this sufficient of the inside wall was cut away to enable a girder being run into position, and another wall built to carry short lengths of bearing girders wedged tight up to the needles.

**A New Free Church at Kippax**, which has been erected at a cost of £1,460, was opened last Wednesday by Mrs. C. I. Hartley, of Castleford.

**A Gymnasium for Girls** was opened recently by Mr. John Piggott, Chairman of the South-Eastern District Park's Committee of the London County Council, in the Southwark Park. A carriage road across the park for night traffic was dedicated by the same gentleman. The gymnasium is tar-paved throughout, with the exception of wood paving under each apparatus. The work has been carried out under the supervision of Lieut.-Col. Sexby, the chief officer of the Park's Department of the Council.

**A Raphael picture has been discovered** at the Exhibition of Sacred Art at Como. In one of the galleries of the exhibition there is a picture, belonging to Dr. Biondi, of Pavia, representing "The Massacre of the Innocents." A number of artists, attracted by the beauty of the painting formed a committee to examine it attentively. The surface of the canvas was carefully scratched in the spot where the signature was expected to be, and below the varnish was found the signature Raph. VRBI, and the year MDX. The picture would therefore belong to the beginning of the last decade of Raphael's life.

## MUNICIPAL ENGINEERS' CONFERENCE.

### FAULTS OF THE L.G.B.

THE annual conference of the Incorporated Association of Municipal and County Engineers was opened at the Engineers' Institute, Cardiff, last Thursday. Mr. W. Harper, C.E. (president), occupied the chair, and a large number of the engineers and surveyors of most of the counties and municipalities in Great Britain and Ireland were present. Before the business meeting was held the Mayor (Alderman Sir Thomas Morel) and members of the Cardiff Corporation received the members of the Association at the Town Hall. The President, in his inaugural address, said he would like to say a few words in reference to the Government Department, which to a large extent controlled the work of municipal authorities.

### Its Actions are Strange.

He referred to the Local Government Board, whose ways were difficult to understand, and whose methods were sometimes impossible to follow. It would be supposed that the work of such a department should be to advance matters of local government, to lead rather than to follow, but in many instances they deterred rather than assisted sanitary progress, and they followed rather than led in sanitary science and matters of public health. It was mainly to our large cities and towns that we had to look for improvements in the laws upon public health matters. These large cities and towns from time to time found it necessary to apply to Parliament for special powers to improve the governments of their districts, but when such applications were made, it was the almost invariable practice of the Local Government Board to oppose any amendment to the existing laws. Was this the right attitude for a governing authority to take up?

### No Originality.

It seemed to him that the Local Government Board, by following these methods, belittled themselves, and it was to be hoped that ere long they would see the necessity of altering their method of procedure towards local authorities. As an illustration, in confirmation of his remarks, he would refer to the Public Health Amendment Act of this Session. What was that measure, and how had it been framed? It was simply a compilation of clauses which had been passed by Parliament in Private Bills, promoted by one or other of our large cities and towns, and, so far as the drafting of the Local Government Board was concerned, it scarcely contained a paragraph of originality. Yet it might be taken as almost certain that, when the different authorities applied to Parliament for the powers which were granted them by way of amendment to the Public Health Act, the Local Government Board used their best endeavours, in nearly every case, to cause the rejection of the powers asked for. Again, some of them would understand, or, rather, fail to understand, why it was that the Local Government Board would not sanction the

### Borrowing of Money

for works which showed any departure from orthodox method, particularly in the question of sewage disposal, until some town or some person had expended large sums of money in the execution of works, and until it had been proved conclusively that the proposed method was unquestionably a successful one. This practice had to a large extent placed important matters affecting sewage disposal in the hands of speculators. On the other hand, they were too frequently ready to sanction loans for the most trumpery and inefficient schemes, provided no one had any objection to raise thereto; whilst no matter how good a scheme might be laid before the Local Government Board for their approval, if it met with any large measure of opposition, particularly from a great landed proprietor, it might be taken for granted that any such proposal

would be met by a refusal from headquarters to the sanction of a loan being raised for the proposed works.

### Is there Such an Authority?

One sometimes wondered whether there were such an authority as the Local Government Board, and if so, whether they ever sat in council as a Board and debated upon the important questions affecting local government and public health. It almost seemed that it was a Board of one man, and that that individual was responsible to a much larger extent than could almost be conceived for the health of the people and the proper advancement of local government, but that he too frequently, was a stumbling block to public progress. He might be considered bold in making allusion to these matters. It might be considered indiscreet for a public official to criticise a superior authority, but it was sometimes only by boldness amounting to indiscretion on the part of someone that reforms could be secured. He believed that everyone present would agree with him in saying that reform in the Local Government Board was urgently needed. The Board ought to be

### An Elected Body

composed of men who had been trained by long service in the great municipalities of the country. Such a board would always be in entire sympathy with the progressive aims and aspirations of municipal and county public life, and would aid and encourage, instead of, as was too often the case under the present regime, prevent the due and proper advancement in directions where greatly needed. The president then proceeded to speak in favour of the municipalisation of gas and water works, electric lighting, street tramways, markets, &c., and the construction of public works by labour directly employed by the municipalities. The system of contracting was open to

### The Vilest Abuses.

The system of obtaining tenders for the execution of public works was very little better than a modified form of gambling. It induced a contractor to calculate the lowest penny at which he could undertake certain work, relying, as he often did, upon the possibility of extra work outside the contract, and of errors or omissions in the specifications or bills of quantities to place him in a position to stipulate such terms and prices as would enable him to realise a profit on the whole contract. After the presidential address Mr. C. H. Priestley, waterworks engineer, read a paper on the Cardiff water supply; Mr. R. Read, Gloucester, on the ventilation of sewers and drains; Mr. Morgan, Ponterdawe, on sewer ventilation; Mr. W. H. Savage, East Ham, on house drainage; Mr. J. B. Wilson, Cockermouth, on a method of augmenting the delivery of gravitation mains, and Mr. Foster, Cardiff, on public baths.

**Improvements to Thaxted Church Tower.**—A new door has been placed at the west entrance, and the tower has been thrown open to the church. About £110 have been spent on the rehanging, quarter tuning, and putting into first class ringing order of the bells.

**New Wesleyan Chapel.**—The foundation stones of a New Wesleyan Methodist Church and School premises were laid last Wednesday at Annfield Plain. The chapel and schools will cost a little over £2,000, and will be built of stone. Mr. George T. Wilson, of Blackhill, is the architect, and Mr. T. A. Turnbull, of Annfield Plain, is the contractor.

**A Handsome Block of Buildings** will shortly be erected in St. Augustine's Parade, Bristol, for the Star Life Assurance Co., from designs by Mr. Arthur Blomfield Jackson, of 26, Mecklenburgh Square, London, W.C. The tender submitted by Mr. A. J. Beaven, of Bristol, for the erection of the work, has been accepted. The entire property has a frontage to St. Augustine's Parade of about 76ft., and it extends back to St. Augustine's Hall. The cost of the site and buildings is estimated at about £50,000.

## Correspondence.

### OUR ST. PAUL'S CATHEDRAL PLATE.

To the Editor of THE BUILDERS' JOURNAL.  
150, HARLEY STREET, W.

SIR,—I think your publication of Wren design for the decoration of St. Paul's, though only in black and white, was a happy idea for now.—Your obedient servant,

G. AITCHISON

June 29th, 1899.

[The plate referred to by Professor Aitchison appeared in our issue dated May 31st. Copies of this number may still be obtained from the publisher, post free for 1½d.—Ed. B. J.]

### REGISTRATION OF ARCHITECTS

To the Editor of THE BUILDERS' JOURNAL.

ST. JAMES' HALL, PICCADILLY, W.

DEAR SIR,—Your Clapham correspondent (page 296, No. ccxxviii.), in criticising certain details of the Bill, forgets that matters of this kind are dealt with in committee and that probably several amendments will be made in due course; though the Bill undoubtedly is open to amendment and improvement on several points, the main principle is good, and this society, while supporting the Bill as a whole, is by no means pledged to every item in it, and the measure contemplates no injustice to any of the arts, crafts or professional bodies allied in any way to architecture.—Yours faithfully,

C. McARTHUR BUTLER,

(Secretary, the Society of Architects.)

### ROWLAND HILL'S CHAPEL AT HAMMERSMITH.

To the Editor of THE BUILDERS' JOURNAL.

21, ASHCURCH GROVE, W.

SIR,—One deplores the frequent announcements under the heading "Vanishing London" in yours and other professional journals, and in the daily press. "Vanishing Suburbs" might equally form a heading, and Hammersmith, still rural and suburban here and there with its charming Ravenscourt Park in its midst, now and then has to contribute cases where old-world residences with their associations have to give way and disappear before the march of modern improvements.

Another old-world relic is doomed to follow the fate of its predecessors, viz., Rowland Hill's Chapel, in King Street West, Hammersmith, in which that eminent divine once conducted religious services. It bears date 1783 as shown by a stone tablet built into its north wall. The little building is square on plan and covered with a green slated roof hipped from each angle. Some fragments remain of what was originally a small and primitive gallery which surrounded the interior. For the last quarter of a century or more the structure has been occupied and used by local house and estate agent as an auction mart. It is averred that in a quaint alley, adjacent to the above stands the house Hampshire Cottage, in which the reverend gentleman resided, and it is interesting to note that in the old brick wall dividing the garden of this from that of the adjoining premises there is to be seen the spot at which a doorway existed through which by a kind and neighbourly arrangement at that time the reverend gentleman was accorded access to roam and meditate in the more spacious grounds of his neighbour at Hampshire House. Probably few of those who now worship at the handsome edifice known as Christ Church, Westminster Bridge Road, are aware that so interesting a relic of by-gone days in connection with its founder yet exists in a quaint nook just off what has become one of the busiest of thoroughfares but which is shortly—so far as the aforesaid little chapel is concerned—to disappear.

There may be some who might like to see the structure prior to its demolition; will you therefore favour me with an insertion of the foregoing in your current number, should you deem it of sufficient interest.—Yours truly,

WILLIAM HOLDITCH STEVENS.

## Views and Reviews.

### "DOBSON AND TARN."

A new edition of the book upon quantities, which has been better known for many years by the name of "Dobson and Tarn" than by its true title, has recently appeared—unfortunately with but little serious alteration. Full as the book is of good material—long as it held its own as the most practical work upon its subject—it has yet fallen behind the times, and now needs material revision if it is to be as useful to the student of the present and the future as it undoubtedly has been to him of the last generation. In London, particularly, the system of "taking off" in trade sequence has long been abandoned in favour of the coupon system, and though for very small works there is something to be said in favour of working by trades, those who have tried both methods are not likely to return to it. And that is established to-day for London may be reasonably expected to be admitted for the whole country to-morrow. Consequently it would be a mistake to place in a student's hand a manual from which he would learn what might have been useful to him twenty years ago instead of that which is likely to be of value to him a few years hence. Considered in detail, and putting this great essential point aside, the book is much better, though labours are not now taken out in such great detail as advocated, sketches are more freely introduced—and even the most ignorant of modern builders would be ashamed of the "designs" illustrated at the end.

"The Student's Guide to the Practice of Measuring and Valuing Artificers' Works," By Edward Dolson and E. Wyndham Tarn, M.A. (Seventh edition, revised.) London: Crosby, Lockwood, and Son.

### SOME MINOR ART GALLERIES.

**GUTEKUNST'S, KING STREET.**—So long as he lives it, there is no one so careless about the condition and consequent value of what he assesses as the professional painter, and therefore it follows that the connoisseur's love and knowledge of art is of a different kind altogether. "The print collector," says Mr. Edmore, "carries a museum in a portfolio. As he at his disposal only a few bank notes, sovereigns even, he may yet surround himself with excellent possessions, of which will not speedily exhaust the charm." Let him then visit this little gallery as often as he should be invited. A dealer in prints can ill afford to have inferior things about him, and therefore it happens that whether they be Dürers, Rembrandts, or Whistlers, they are never the meanest examples. As to the state of the plate, on which so much depends, the visitor has only to ask, and whether buying or not, he can hardly fail to learn something. It is meet that none but the best should be of this goodly company, so we are with the Whistlers are selected examples of Méryon, Legros, Cameron, Strang, and Zorn. The etchers' art is hedged about with conventions as stiffly as any other perhaps, but within bounds there is freedom, and each of the men above named has set his own mark on his work. The public is slow to discover the poetry which enters, however quietly, into every true architect's work; but here, as one looks at these Méryons, Camerons, Whistlers, one feels that by some, at any rate, it has been understood.

**AT GOUPI'S.**—M. Theodore Roussel, having resided some twenty years in this country, must at this time be almost an Englishman. His best scenes are English, at least, but his art, I would say, is almost entirely his own, and a very lovely possession at that. There is something here of a "Wood in Autumn" that affects the mind like the slowest and stealthiest scribe. But for the gleam of light which falls in it you would not detect the path. I have seen a picture called "Hush" which had almost, if not quite, the same emotional value. Such pictures are rare as the peace which we enjoy. Of the rest one can only say generally that the charm of the best landscapes here is at once individual and indescrib-

able. One knows that where sea and sky meet in a picture the feeling most generally is that the elements, air and water, have two different stories to tell, but here they seem part of one poem. The friend who is with me speaks of the transparency of the brush work which makes it appear that the brush, like a bluish veil, has been lightly drawn over the whole. At Goupil's publishing house, Bedford Street, we are also invited to see some coloured etchings by the same hand. M. Roussel frames his own pictures, and as the tendency is nowadays to regard a few crafts as but part of a good day's work he would appear to be well abreast of the times. Of these things we know nothing at present however, and can only speak positively of what we have seen.

**THE HOLLAND FINE ART GALLERY.**—The Dutchmen must always be with us it seems, and one becomes accustomed to seeing as often as the season recurs a selection more or less satisfactory of the latest paintings from Holland. So far as they are concerned with landscape it would seem to be difficult to draw any hard and fast lines between them and the English and French. What the men of the Barbizon School taught in their day has been so completely absorbed and assimilated that one hardly knows who is who (to use the vulgarst catch word), and we for our part, thanks to our greatest masters, Turner, Constable, and the men of the Norfolk school, have given at least as much as we have taken. So landscape is landscape, no matter who paints it, or from what country he hails. Come we next to the art of the homestead, in which the human interest is greatest. There was no one in England or Holland like Millet when he announced, not by speaking, but painting, that there may be the elements of an Epic in the tale of the simplest lives, and that the episodes of just such a tale are the things which should be depicted. There is something essentially classical in this austere conception of art, and the possession of that something has led to the simplest works of this painter being ranked with the greatest we have. In England we always want teachers it seems, and the effect of his influence here is seen in the number of works wherein the merely uncouth is idealised, and the sentiment is of the sickliest. In Holland they had not a Millet, and yet had not our need of a master, for the Dutch have had a true art of their own since when their Independence was won, and we see in Israels, with a difference, what centuries ago was seen in the homeliest, sunniest works of their masters. That a far deeper feeling inspires most of the modern work only makes it dearer to us.

**IN THE DOWDESWELLS' GALLERY.**—The attraction here at the moment is the bevy of "Beautiful Women" portrayed by Mr. Mortimer Menpes, the majority of whom are not beautiful, and appear to have been drawn or painted, if not simply to keep the pot boiling, then at least to keep his hand in. With the hand we are chiefly concerned at the moment, for defter, daintier, pencil work could hardly be seen or imagined than we find in the best of this; the one faint line of beauty enclosing the form so surely. So, too, of these slight chalk drawings. There are etchings on ivory also, and oil paintings, much less successful, though probably equally true as portraits. Mr. Menpes appears to move largely in theatrical circles, for the portraits of Mrs. B. P. are many; and almost, if not quite, the best of the pencil drawings are those of Sir Henry Irving, the one favoured man in the place.

CIRCUIT.

**The "Tariff-Frame" Hotel Guide.**—The traveller in the United Kingdom, Paris, or the United States, who wishes to know the best hotel in whatever locality he may be should consult this useful little guide. It can be obtained at any of the hotels mentioned in its pages, or by application to the Hotel and General Advertising Company, Limited, of 239-241, Shaftesbury-avenue, London.

## Keystones.

**New Shambles at Arbroath** are to be erected at a cost of between £2,000 and £3,000.

**A New Road** was recently opened at Strone of Cally, Blairgowrie, by Miss Constable of Balmyle.

**The Virchow Museum of Pathological Anatomy** was opened by Professor Rudolf Virchow last Tuesday week.

**Mr. Horace Cheston, F.R.I.B.A.,** of 5, Union Court, London, E.C., has been elected the Surveyor to the Royal Hospitals of Bridewell and Bethlem.

**A new Presbyterian Church** is to be erected at Dailly, Ayr, at an estimated cost of £2,100. The church will seat 352 persons and an adjoining room will seat 100 persons.

**The Byron Statue.**—Sitting in committee recently the Aberdeen School Board decided, by eight votes to seven, to decline to grant a site in the Grammar School grounds for the proposed statue of Byron.

**Miss Grant, the Sculptor,** has just finished a fine bust of Mr. Gladstone, which was very much admired by many of the friends and relatives of the departed statesman who saw it at her studio last Wednesday.

**The Tender of the Improved Wood Paving Company, Ltd.,** of 46, Queen Victoria Street, London, E.C., has been accepted by the St. Olaves' Board of Works for the supply of 61,000 Jarrah wood paving blocks.

**A New Hotel** has been erected at Leeds, on the building and furnishing of which about £90,000 has been expended. The façade is of terra-cotta, in a free Renaissance style. Messrs. Chorley, Conon, and Chorley were the architects.

**Proposed new Technical School for Padiham.**—At the Padiham District Council's offices last week a Local Government Board enquiry was conducted by Mr. E. A. Sandford Fawcett into an application for permission to borrow £4,000, for the purpose of a new technical school. There was no opposition.

**A New Infirmary.**—The Camberwell guardians have approved of the plans prepared by Mr. E. T. Hall, of 57, Moorgate Street, London, E.C., for the erection of an infirmary, guardians' offices, and relief station, at an estimated cost of £208,000.

**A Congregational Church** is to be built at Horsley at a cost of about £1,000, from the designs by Mr. F. E. Dotchin, of Newcastle. The foundation stone was laid last Wednesday. The new church, which is in the transitional style, will seat about 230. Mr. Humphrey Atkinson, of Newcastle, is the contractor.

**A Monument to Emmanuel Chabrier,** the author of "Gwendoline," "Briséis," and "España," is about to be erected in France, and a subscription list has been opened, to which the Minister of Fine Arts has given 1,000 francs. The list at present stands at 4,127 francs.

**Aspinall's New Premises.**—The extensive premises at New Cross of Aspinall's, Limited, which were recently destroyed by fire, are being rebuilt. The architect is Mr. Max Clarke, of Queen's Square, London, W.C.; and the contractors are Messrs. L. Whitehead and Co., Limited, of Portland Works, Clapham Road, London, S.W.

**New Library for Leamington.**—At a special meeting of the Leamington Town Council last week, the plans of Mr. J. Mitchell Bottomley, of Middlesborough, for a new Free Library, Technical Institute, and School of Art, were adopted. The plans were competitive. Mr. J. E. Newberry, of Westminster, was awarded the second premium of £50.

**The Contracts for Paisley Abbey Restoration** have been fixed as follows:—Joiner, slater, and plaster work, Messrs. Boyd and Forrest, Kilmarnock; plumber work, Messrs. James Kilpatrick and Son, Paisley; glazier work, Glass Stainers' Company; iron and steel work, J. McMillan and Co. The estimates amount to about £13,000.

[FIRST ANNOUNCEMENT TO READERS OF "THE BUILDERS' JOURNAL"]

## NEW ENTERPRISE UNDERTAKEN

BY *The Times*

# THE CENTURY DICTIONARY:

## A FACT-BOOK AND WORD-BOOK COMBINED.

A NEW WORK ON A NEW PLAN—GIVING, FOR THE FIRST TIME, EVERY FORM OF SPELLING, PRONUNCIATION, AND USAGE KNOWN, WHETHER ENGLISH, AMERICAN, AUSTRALIAN, PROVINCIAL, OR COLLOQUIAL.

Eight sumptuous volumes; 7000 large quarto pages; 500,000 definitions; 7500 illustrations; 300,000 quotations; a work of which the editorial cost, alone, was more than £200,000.

THE proprietors of THE TIMES have, within recent years, greatly extended the scope of that newspaper's operations. The impression of THE TIMES which appears at four o'clock in the morning, is now followed not only by a second edition, published at half-past one in the afternoon, chiefly for circulation in the City; by THE MAIL, published three times a week, and by THE TIMES WEEKLY EDITION; but also by LITERATURE, a critical review which appears every Saturday.

The publication of occasional biographies, annual summaries, and other monographs, reprinted from the columns of THE TIMES, has been followed by the publication of a series of periodical law reports and digests of cases, as well as by the half-yearly "Issues," an account of newly-organised public companies.

Four years ago, THE TIMES ATLAS was published, to which THE TIMES GAZETTEER has recently been added. And in March, 1898, THE TIMES Reprint of the Encyclopædia Britannica (9th edition) was offered to the public. In the course of only one year, more than 18,000 copies—450,000 volumes—of this standard work have been sold by THE TIMES.

### A NEW WORK OF REFERENCE.

The undertakings of THE TIMES are now further extended by the issue of THE CENTURY DICTIONARY, a word-book and fact-book combined, at once the most complete lexicon of the English language and the most convenient encyclopædic work of reference for the purpose of quickly arriving at isolated facts.

Peculiarly useful as a dictionary to the possessors of the Encyclopædia Britannica (which, indeed, contains not less than 10,000 words which no previous dictionary had defined), THE CENTURY DICTIONARY is also a most convenient adjunct to the Encyclopædia Britannica from another point of view. The exhaustive treatises in the Encyclopædia Britannica discuss groups of facts. They are the best monographs in the language, and the reader who has an hour's time to spend will always find in the Encyclopædia Britannica a clear and agreeably written account of any branch of art, science, or history which he desires to investigate.

### FOR BUSY MEN AND WOMEN.

THE CENTURY DICTIONARY, on the other hand, divides the vast structure of knowledge into a greater number of compartments, enabling the reader to find, with the least loss of time, any one item of information at which he may desire to arrive; to examine, so to speak, the contents of any one pigeonhole without handling the papers in any other pigeonhole.

Such is the relation between the two books, if the CENTURY DICTIONARY be regarded as a fact-book.

As a word-book, it is incomparably the best dictionary in existence. The New English Dictionary will, no doubt be of very great value, and especially to philologists, when it is completed, ten years hence; but, meantime, THE CENTURY DICTIONARY is the largest as well as the most comprehensive and beautifully illustrated lexicon of the English language. It completes, in the most admirable fashion, THE TIMES Library of Reference, and it will no doubt find its way to the shelves of every well-chosen library, however modest.

### NOW, RATHER THAN LATER.

There is, however, in this connection a very relevant question, as to the desirability of procuring the work as soon as possible. Book-buyers have learned by experience, that most books are at first offered in an expensive form, and later, in a cheaper guise at reduced prices. The novel published last year in three volumes at a guinea and a half, may be had this year for six shillings; the book of travel which cost fifteen or eighteen shillings a few months ago, is to be procured to-day, by those who waited patiently, for half the price. THE TIMES has, however, in its issue of the Encyclopædia Britannica, and of THE CENTURY DICTIONARY, broken away from this tradition. It offered the first few thousand copies of the Encyclopædia

Britannica at 20 per cent. less than the price at which many thousands of copies were subsequently sold. Those who promptly ordered their copies had the benefit of the minimum prices. They took the trouble to act as soon as the offer was made, and those who waited were compelled either to do without the work or to pay more for it.

### THE SECRET OF THE BARGAIN.

In the case of THE CENTURY DICTIONARY, a limited edition was offered a few weeks ago for £13, in half Morocco binding, or thirteen monthly payments of one guinea each; little more than half the publishers' price. That price still obtains, and any reader who at once applies to THE TIMES for a copy of the work may benefit by this temporary arrangement. The best way to introduce a really good work of reference is to sell as quickly as possible, without regard to immediate profits, a limited edition of it; for, if the book will speak for itself, every copy that finds its way to any house supplies a most eloquent and unanswerable advertisement. This is what is now being done with THE CENTURY DICTIONARY. But the price will be increased as soon as the remaining copies of this first edition have been exhausted, and there is now so little time to lose that those who intend to procure the work at the present prices will do well to make immediate use of the order form.

### A ROYAL ROAD.

The old saying that there is no royal road to learning is a wholesome maxim for nursery use. The first marches upon that labourous route must necessarily be difficult, for the power of rapid and accurate comprehension can only be acquired by vigorous preliminary discipline. The long way—league upon league of cube root, irregular verbs, and the catalogue of kings and queens—hardens the muscles once for all, and those who shirk in the shady by-paths never acquire a sturdy gait. When, however, the end of the broad high road is reached, the conditions of the journey are greatly altered.

### "GENERAL INFORMATION."

In the course of the more or less desultory progress toward the position occupied by what one calls "well informed" men and women, we are all at liberty to select our own itineraries. And good books of reference unquestionably offer us a royal road to this supplementary sort of learning. Once at the end of the prescribed route, there is no reason why we should not stray at will, and be the better for our little excursions, if only we pause to examine what we see about us. It is this habit of observing, of questioning, of verifying that we need to cultivate. But it is a habit which those who have completed the tasks of routine education are not likely to acquire, unless the way is made very smooth for them.

### NEW WORDS AND NEW FACTS.

It is in this connection that the CENTURY DICTIONARY may be fairly considered to provide a royal road to learning—to that sort of learning which enables us to think intelligently and to talk intelligently about the current topics of the day. The occurrence in one's newspaper of an unfamiliar word, the mention of an unknown substance or an unknown process, arouses in the average reader's mind enough of curiosity to make him turn to a work of reference, if he knows that the information he desires will easily be found. But such casual invitations to the pursuit of knowledge are hardly strenuous enough to draw him among the bristling difficulties of special text books. He will learn a little if he is not afraid of having to learn too much; he will spend five minutes very profitably, if he is not afraid that he will be led to make too good a use of half an hour. With all the good will in the world one cannot learn everything there is to learn, and if, when we are confronted by any new fact, we learn only enough about it to understand a paragraph in a newspaper, or a page in a review, we are at any rate a little better off than if we had remained in outer darkness.

# WHAT SOME EARLY PURCHASERS SAY ABOUT THE "CENTURY DICTIONARY,"

## THE NEW WORK ISSUED BY *The Times*:

THERE have been published, in the columns of *THE TIMES*, since its issue of the *CENTURY DICTIONARY* was first announced on May 8th, more than a hundred letters from purchasers of the *CENTURY DICTIONARY*. It is impossible to reproduce them all in the limited space of this one advertisement, but a few representative letters from different classes of subscribers will show how general is the usefulness of the work.

These letters are not empty compliments. They are written by people who sent money to *THE TIMES*, expecting to receive from *THE TIMES* full money's worth. The point of view from which they regard the volumes of the *CENTURY DICTIONARY* is not an indulgent one. When they unpack the volumes they are quite prepared to find fault if there is fault to be found. There is none. They see that they made a good bargain; that they got even more for their money than they had hoped to get.

Such letters as these show, too, how the public use the *CENTURY DICTIONARY*, and what they find in it. The opinions of the critics who review books for newspapers and magazines are, necessarily, the opinions of specialists. A work of reference may be of the utmost interest to them, and yet not be less directly adapted to the needs of the general reader.

Here we have the direct expression of the possessor's judgment upon the work—the opinion of the man who bought it to use, and finds it useful.

**From a Privy Councillor:**

54, Portland Place, London, W.

The *CENTURY DICTIONARY* is a masterpiece of con-  
solation. An examination of it fills me with a strong  
sense of the care bestowed to insure accuracy. It is a  
work of exceptional value and utility, which I find  
most helpful in many ways.

(Signed) JAMES BRYCE.

surpasses anything hitherto undertaken in our lan-  
guage. What has particularly struck me to find, in a  
general dictionary, is the vast number of scientific and  
technical words, and the fulness and accuracy of their  
definition.

In short, the *CENTURY DICTIONARY* is a necessary and  
most worthy adjunct to the *Encyclopædia Britannica*.

(Signed) CHARLES GRAHAM,  
Professor of Chemical Technology.

May 26th, 1899.

being able to place the fullest confidence in its dicta, as  
absolute and beyond question, and its easy acquisition  
by the means you have provided demands that all pro-  
fessional men whose sayings and doings in any way  
become public should be in possession of such an indis-  
pensable addition to their technical library.

(Signed) W. R. HERRING,  
Chief Engineer and Manager.

May 22nd, 1899.

**From a Practical Manufacturer.**

Rosehaugh, Clitheroe, May 23rd, 1899.

With reference to the special branches of knowledge  
referred of in the *CENTURY DICTIONARY*, I am perhaps best  
qualified to speak as to Chemistry and Chemical Tech-  
nology. These subjects generally I have looked into  
very carefully, with the result that I think the words  
defined cover a very wide field, while the definitions  
and descriptions are concise and accurate.

The branch of Chemical Technology with which I am  
most concerned is that of Portland Cement manufac-  
ture, and I have naturally looked critically into every-  
thing bearing on this subject, and that of calcareous  
elements generally.

We have all the information the general inquirer is  
likely to want, while if more is needed it may be used  
as a key for further investigation.

I am myself now using the *DICTIONARY* as the starting  
point for the information on the subject.

(Signed) CHARLES SPACKMAN, F.C.S.

**From a Physician.**

Melrose House, Ryde, I. of Wight.

The *CENTURY DICTIONARY* is quite perfect.

(Signed) ALEXANDER G. DAVEY, M.D.

May 22nd, 1899.

**From a Statesman.**

7, Cromwell Gardens, S.W.

I am glad to express the opinion that the *CENTURY  
DICTIONARY* appears to be a monument of skilled and  
well-directed industry, and an exceedingly useful and  
valuable addition to a library—in fact, a work which is  
fully worthy of publication by *THE TIMES*.

(Signed)  
WM. DES VOEUX [Bart., G.C.M.G.]

June 3rd, 1899.

**From an Engineer.**

Edinburgh & Leith Corporations Gas Commrs.  
Chief Engineer and Manager's Office,  
New Street Works, Edinburgh.

I have already devoted some time to a perusal of the  
*CENTURY DICTIONARY*, particularly with regard to its  
scientific and practical definitions of subjects appertain-  
ing to Civil and Mechanical Engineering. I am pleased  
to find full definitions of terms, sufficient to satisfy the  
most exacting Experts upon the particular subjects in  
question, and such as I have never found elsewhere in  
kindred publications.

The great charm of the work to me is the fact of

**From a Railway Manager.**

Great Eastern Railway, General Manager's Office,  
Liverpool Street Station, London.

I have received my copy of the *CENTURY DICTIONARY*,  
and regard it as a most valuable addition to anyone's  
library. I have had occasion more than once to refer to  
it, and each time have found with the greatest ease what  
I sought.

The particulars given regarding railways, their appli-  
ances, &c., are to me, as they will be I am sure to all  
railway men, most interesting.

The two copies which were ordered by my Directors  
—one for the Great Eastern Library at this station, and  
the other for the Great Eastern Mechanics' Institute, Stratford  
are highly appreciated.

(Signed) [SIB] WM. BIRT.

May 24th, 1899.

**From a Surveyor.**

Pinner House Pinner, Middlesex.

I am very much pleased with the *CENTURY DICTIONARY*  
you sent me, and, although I have only had it  
a short time, I have found it very useful as a book of  
reference in my professional work.

Its description of machinery and architecture is most  
explicit; and I should have no hesitation in recom-  
mending it to anyone I know desirous of purchasing a  
comprehensive work of this kind.

(Signed) C. A. WOODBRIDGE.

May 24th, 1899.

**From a Professor of Chemistry.**

The Laboratory, 23, Euston Buildings, N.W.

I consider the *CENTURY DICTIONARY* a marvel of  
scholarship, of philological research, of fulness of  
definition and illustration. In these respects, in its  
completeness, and in its explanatory quotations, it far

**WHAT THE PRESS SAYS:**

**The Daily Telegraph.**—"One of the most notable  
monuments of the philological industry of the age."

**The Standard.**—"A work of great ability, fine  
scholarship, and patient research in many widely  
different departments of learning."

**The Times.**—"The most complete English  
dictionary that is at present accessible."

**The Athenæum.**—"Far and away the largest and best  
general and encyclopædic dictionary of the English  
language."

**Pall Mall Gazette.**—"It is fuller, more complete,  
with fewer faults than any rival."

**Daily Chronicle.**—"As we turn the leaves of this  
splendid work, we feel acutely the inadequacy of  
any description apart from the actual handling of  
the volumes."

**Dublin Review.**—"Not only the *CENTURY DICTIONARY*,  
but the dictionary of the century."

**Glasgow Herald.**—"Combines, in the highest degree,  
the qualities of thoroughness and accuracy."

**The Speaker.**—"The most practical and most busi-  
ness-like 'Lexicon of the English language' that  
exists."

**The Scotsman.**—"The most extensive, and, taken  
altogether, the best as well as the biggest work of  
the kind that has yet come to maturity."

**Guardian.**—"No expense has been spared to make the  
work as attractive as possible to the general  
public."

**SPECIMEN PAGES.**—A richly illustrated pamphlet containing specimen pages from *THE CENTURY DICTIONARY* may be had gratis and post free, upon application to the Manager of *THE TIMES*. This pamphlet also contains extracts from a number of newspapers, and from these the reader may see for himself how hearty and how general has been the enthusiasm with which the production of this marvellous work was received by the Press.

**SPECIAL PRICES**  
FOR THE LIMITED EDITION OFFERED BY *The Times*.

**THE CENTURY DICTIONARY.**  
EIGHT SUMPTUOUS VOLUMES. 12 inches high, 9 inches wide, 2½ inches deep.

<b>HALF MOROCCO BINDING.</b> £13 in Cash, or 13 Monthly Payments of ONE GUINEA each.	<b>THREE-QUARTER LEVANT BINDING.</b> (Which we recommend.) £15 in Cash, or 15 Monthly Payments of ONE GUINEA each.	<b>FULL MOROCCO BINDING.</b> £18 in Cash, or 18 Monthly Payments of ONE GUINEA each.

Please address the package to.....

If books are to be delivered beyond London postal district, the purchaser should add here the name of the railway company or carrier in London to whom delivery is to be made. Beyond the London postal district, carriage will be at purchaser's cost.

**MONTHLY PAYMENTS.—ORDER FORM.**

Date.....1899.

THE MANAGER, "THE TIMES," PRINTING HOUSE SQUARE, LONDON, E.C.

I enclose One Guinea. Please send me THE CENTURY DICTIONARY bound in Half Morocco, price 13 Guineas.

Three-quarter Levant, price 15 Guineas. } Strike out two of these lines.

Full Morocco, price 18 Guineas.

The balance of which sum I agree to pay you, or any one you appoint, at the rate of One Guinea a month; my next payment upon delivery of the complete 8 volumes, and my succeeding payments on the corresponding day of each month following. Until such payments are complete, I engage that the volumes, not being my property, shall not be disposed of by sale or otherwise. I further agree that if owing to unforeseen circumstances, of which you shall be the judge, the volumes cannot be delivered, the return of the deposit of One Guinea to me shall cancel this agreement.

(Signed).....

(Address).....

The privilege of making monthly payments is accorded to residents in the United Kingdom only.

Please address the package to.....

If books are to be delivered beyond London postal district, the purchaser should add here the name of the railway company or shipping agent in London to whom delivery is to be made. Beyond the London postal district, carriage will be at purchaser's cost.

Readers who desire to leave this page uncut, may, upon application to the publisher of *THE TIMES*, obtain a detached Order Form similar to that above printed. Those who wish to examine Specimen Volumes in the various forms of binding, and to give their Orders in person, are invited to call at *THE TIMES* Office, Printing House Square.

Residents of the West-end who cannot conveniently visit *THE TIMES* Office may examine, at the establishment of Messrs. Chappell & Co., Pianoforte Manufacturers, 1, New Bond Street, or at Messrs. Street & Co.'s Advertising Offices, 161, Piccadilly, Specimen Volumes of *THE CENTURY DICTIONARY*, at either of which addresses orders will be booked.

## Keystones.

**A Refreshment Kiosk** has been erected in Brixton Gardens, from the designs by Mr. W. R. Bryden.

**A Stained-Glass Window**, erected in Zion Chapel, Batley, was unveiled last Wednesday evening by the Rev. J. T. Radcliffe. The window was erected by Messrs. Talbot and Co., of Leeds.

**Three Memorial Stained-Glass Windows** have been placed in the apse of Inverbroock Free Church. They are the work of Messrs. William Pearce, Ltd., of Birmingham, and Mr. D. J. Scott, of Brothock Bridge, fixed them.

**The new Royal London Ophthalmic Hospital** was opened on Tuesday last week by the Duke and Duchess of York. The new buildings consist of three blocks, and have cost £80,000. The architects were Messrs. Young and Hall.

**New Wesleyan Chapel for Crookes.**—The foundation stone of a new Wesleyan chapel and school was laid last Thursday. The chapel and schoolroom will accommodate about 600 persons. The cost of the building will be nearly £5,000.

**New Printing Offices at Eastbourne** have been built for the "Eastbourne Chronicle." The offices were built from the plans by Mr. C. Crisford, of Eastbourne, and Messrs. Millar and Selmes, of the same town, were the builders. The buildings cost about £7,000.

**A New Fountain at Ipswich** was unveiled last Thursday. The fountain, which has been placed at the junction of Portman Road with Princes Street, in close proximity to the Cattle Market, was built from the designs of Mr. Frederick Wheeler, F.R.I.B.A. It is executed in Cornish and Aberdeen granite, and is about 14ft. in height.

## COMING EVENTS.

### Wednesday, July 5.

"BUILDERS' JOURNAL" COMPETITION.—EXHIBITION OF DRAWINGS.—(Third day.) At 56, Great Marlborough Street, W. 10 a.m. to 7 p.m.  
ROYAL ARCHEOLOGICAL INSTITUTE.—(1) Dr. S. Russell Forbes on "Recent Excavations in the Forum at Rome." (2) Professor E. Lewis, M.A., F.S.A., on "Roman Antiquities in the Rhineland." 4 p.m.  
BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary Meeting of the Members. 8 p.m.

### Thursday, July 6.

"BUILDERS' JOURNAL" COMPETITION.—EXHIBITION OF DRAWINGS.—(Fourth day.)

### Friday, July 7.

"BUILDERS' JOURNAL" COMPETITION.—EXHIBITION OF DRAWINGS.—(Fifth day.)

### Saturday, July 8.

PEOPLE'S PALACE ARCHITECTURAL SOCIETY.—Visit to Parke's Museum, Margaret Street, W. 3 p.m.  
"BUILDERS' JOURNAL" COMPETITION.—EXHIBITION OF DRAWINGS.—(Concluding day.)

### Monday, July 10.

CENTRAL SCHOOL OF ARTS AND CRAFTS.—Exhibition of Students' Work. 12 to 8.30 p.m.

### Tuesday, July 11.

CENTRAL SCHOOL OF ARTS AND CRAFTS.—Exhibition of Students' Work. 12 to 8.30 p.m.

### Wednesday, July 12.

CENTRAL SCHOOL OF ARTS AND CRAFTS.—Exhibition of Students' Work. 12 to 8.30 p.m.  
NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—A general meeting will be held at Furness Abbey Hotel at 11 a.m., and an excursion will take place in the afternoon to Millom; start at 1.25 p.m.

### Thursday, July 13.

NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS.—Excursion to Barrow; start at 9.20 a.m.

J. Jackson	1,178 0 0		

\* Accepted.  
**HALSTEAD (Essex).**—For relaying drains, new sanitary arrangements, and water supply to the workhouse, for the Board of Guardians. Messrs. Clare and Ross, architects,

Chelmsford, and 1, West-street, Finsbury-circus, E.C. Mr. J. S. Farmer, quantity surveyor, Ipswich:—  
S. Wiles ... £277 0  
E. West ... 699 0  
F. Johnson ... 698 0  
G. Sudbury and Sons ... 656 0  
W. Sudbury, sen. ... 617 15

\* Recommended for acceptance.  
**LITTLE WALTHAM (Essex).**—For house, shop, stables, and slaughter-house, for L. Campen, Esq. Messrs. Clare and Ross, architects, Chelmsford, and 1, West-street, Finsbury-circus, E.C.:—  
Smith and Son ... £1,697 10  
F. Johnson ... 1,689 0  
G. Holland ... 1,673 0

\* Accepted.  
**LONDON.**—Rebuilding offices at Vicarage Road Board School for all departments against the boundary walls of Vicarage Road and Inverness Place, refitting lavatories, and providing new drainage scheme for school and school keeper's house. For the London School Board. Mr. T. J. Bailey, architect:—  
W. V. Goad ... £2,395  
Martin, Wells, and Co. ... 2,799  
L. H. and R. Roberts ... 2,694  
Kirk and Randall ... 2,530

\* Accepted.  
**LONDON.**—New house at Woolmore-street Board School, for the schoolkeeper and enclosing, draining, and paving the additional land; filling in arches forming gullies and infants' covered playground; providing windows to class-room on north side of graded school on the first and second floors, for the London School Board. T. J. Bailey, architect:—  
Wall and Co. ... £2,066 0  
McCormick & Sons ... 1,844 0  
Williams and Son ... 1,787 0  
L. H. & R. Roberts ... 1,731 0  
F. Bull ... 1,698 0

\* Accepted.  
**LONDON.**—For private street works for the Hornsey District Council. Mr. E. J. Lovegrove, Engineer and Surveyor, Hornsey District Council:—

	Russell-	Hornsey-lane
	road.	Gardens.
Pedrette and Co.	£297	£3,185

Town	766	2,584

\* Accepted. † Withdrawn.  
**NOTTINGHAM.**—For the erection and completion of four villa residences, Sherwood Rise, Nottingham. Mr. Frank Parkin, C.E., architect, Prudential-buildings, Nottingham:—

W. Wilson	£1,499	Thos. Long	£3,020
A. B. Clarke	3,288	Wm. Maulo	2,983
J. Musson	3,049		

\* Accepted.  
**PENARTH.**—For additions to schools, Albert-road, for the School Board. Messrs. Seddon and Carter, architects, Bank-buildings, St. Mary-street, Cardiff. Quantities by architects:—  
J. S. Shephard ... £1,833 0  
Latty and Co. ... 1,639 0  
John Jones ... 1,637 12  
Thos. Bevan ... 1,539 0

\* Accepted.  
**ST. ALBANS.**—For the erection of a residence, Grosvenor-road, St. Albans, for Councillor Edwin Lee. Mr. Percival C. Blow, architect, 7, London-road, St. Albans:—  
W. Sharp ... £1,043  
E. Dunham ... 1,007  
J. T. Bushell ... 965

\* Accepted.  
**ST. ALBANS.**—For erection of stabling, the Cloisters, St. Albans, for Messrs. J. Fish and Son, Limited. Mr. Percival C. Blow, A.R.I.B.A., architect, 7, London Road, St. Albans:—  
C. Miskin and Sons ... £278  
J. and W. Savage ... 2,665  
Boff Bros. ... 665  
C. Deenhams ... 645

\* Accepted, subject to slight modifications.  
**ST. ALBANS.**—Repairs and additions to the "Jolly Sailor," Sandridge Road, St. Albans. Mr. Percival C. Blow, A.R.I.B.A., architect, 7, London Road, St. Albans:—  
C. Brightman ... £1,285  
J. T. Bushell ... 1,185  
C. Miskin and Sons ... 770

\* Accepted, subject to slight modifications.  
**ST. ALBANS.**—For the erection of a residence, London Road, St. Albans, for Mr. W. S. Glover. Mr. Percival C. Blow, A.R.I.B.A., architect, 7, London Road, St. Albans:—  
J. T. Bushell ... £1,285  
Boff Bros. ... 1,185  
C. Miskin and Sons ... 1,198

\* Accepted.  
**SUTTON.**—For proposed council offices and fire station, for the Urban District Council. Mr. C. Chambers Smith, town surveyor, Sutton Urban District Council:—  
A. Bush ... £3,844  
C. F. Kearley ... 8,675  
W. Wallis ... 8,451  
Stewart and Sons ... 7,972

\* Accepted.  
**WOKINGHAM.**—Rebuilding coach factory (part old). A. E. Sidford, M.S.A., architect. Quantities by Mr. E. Ide, Cockspur Street:—  
E. C. Hughes ... £787  
J. B. Seward, Wokingham ... 2,730

## CONTRACTS OPEN.

### TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ENLARGEMENT and ALTERATION of the HEAD POST OFFICE at Carlisle.

Drawings, specification, and a copy of the conditions and form of contract, may be seen on application at the Postmaster's Office, Carlisle.

Bills of quantities have been prepared for the use of builders by Mr. J. FLEW, of Bradford, and, together with forms of Tender, may be obtained at the undermentioned office on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on FRIDAY, JULY 21st, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W. and endorsed "Tender for Enlargement, &c. Carlisle Head Post Office."

H.M. Office of Works, &c.  
June 28th, 1899.

# HEATING AND VENTILATION.\*

By WALTER JONES.

(Concluded from page clxvi., No. CCXXIX.)

FOR warming buildings there are five recognised methods of calculating the amount of heating surface required for varying temperatures.

(1) On the cubic capacity of the room or building.

(2) On the cubic feet of air to be warmed per minute.

(3) On the superficial feet of glass surface.

(4) On the superficial feet of glass surface and its equivalent in exposed walls, ceilings, &c.

(5) On the heat units emitted per square foot of heating surface per hour.

So far as my experience goes, not one of these methods is in itself satisfactory, for the following reasons:—

(1) *On the Cubic Capacity.*—The heat required to warm the air in any room is infinitesimal compared with the loss by the window surface, and the heat absorbed by the walls, furniture, &c. I had an amusing illustration of this some years ago. A gentleman who was writing a book on the subject had proved to demonstration (theoretically) that so many cubic feet of air could be raised a certain number of degrees by a given number of heat units; that by pouring  $6\frac{1}{4}$  gallons, i.e., one cubic foot of boiling water, into a radiator, it would maintain a temperature of 60deg. in his bedroom during a frosty night. He asked me for the loan of a radiator to prove his theory, and although I told him that ten times this quantity of heat would be insufficient, he insisted that his conclusions were correct. He borrowed the radiator—I have not heard the result or seen the radiator since.

Take another illustration—the proportion of heating surface required for a small room or greenhouse where the cubic capacity is small and the cooling surface proportionately large, will be much greater than is necessary in a large room where these conditions are reversed, hence no table based on the cubic capacity alone will be satisfactory for rooms differing in size, or with great variations in the proportion of glass or other cooling surface.

(2) *On the cubic feet of air to be warmed per minute.*—I have tried repeatedly to test the accuracy of Hood's rule which Mr. Dye says "is an exact rule which has needed no variation for horticultural work." My experience is that it is an impossible rule either for horticultural or any other class of buildings, being cumbrous, circuitous, and altogether unreliable and unworkable.

(3) *On the superficial feet of glass surface.*—The cooling effect of glass is so much greater than wood or brickwork that no rule can be considered complete that leaves glass surface out of consideration. For instance, it will take about five times the amount of heating surface to maintain 60deg. temperature in a greenhouse that would be required in a room the same size with only one small window in the room, and for this reason any calculation based on the glass surface alone will be misleading when applied to rooms having considerable variations, either in cubic capacity or superficial surface of glass.

(4) *On the super. feet of glass and its equivalent in exposed wall.*—This basis of calculation is better than any of the others providing the data are correct. I have examined some elaborate calculations on this basis where the result obtained for one room has been equal to 14ft. super. per 1,000 cubic feet, and another room of about the same size in the same building has been 44ft. per 1,000 cubic feet—i.e., three times the quantity of pipe surface to obtain the same result. In hundreds of cases the information cannot be obtained for this basis of calculation, hence this rule requires some further consideration and amendment.

(5) *On the heat units emitted per square foot of heating surface.*—Now, it would appear the most natural thing in the world to accept a

British standard unit as a proper basis for making calculations, and yet I know of no basis that would be so misleading or so unreliable. The standard unit of heat is the necessary amount to raise the temperature of 1lb. of water at 32deg. Fah. one degree, i.e., from 32deg. to 33deg., and many writers have not only assumed, but have printed tables showing that one heat unit will also raise 1lb. of water from 211deg. to 212deg., but this conclusion is altogether erroneous. I have carried out scores of experiments to boil water with gas jets, with steam, and with fuel. In one of these tests which may be taken as a fair sample of the others, to boil 125 gallons of water in a tank with  $\frac{1}{2}$ in. steam jet, the first 50deg. were raised at the rate of 1.8deg. per minute, the next 40deg. at 1.4deg. per minute, the next 30deg. at 1.2deg. per minute, and the next 20deg. at .73deg. per minute, i.e., the temperature of the water when cold was heated two and a half times as fast as when near boiling point. Again, the unit is so small a factor, its relative value changes with the increasing temperature, the influence of varying temperatures and the variations in the amount of cooling surface are so enormous, that the utmost care would be necessary to ensure satisfactory results.

Let me give two illustrations of this.

First.—Most of you will know that 100ft. run of  $\frac{1}{2}$ in. bore high pressure tube will raise the temperature of a room to about the same extent as 100ft. run of 3in. low pressure pipes, although the latter contains nearly three times the surface, and contains about twelve times the quantity of water. Query.—How many heat units are contained in the relatively small volume of water?

The second illustration is one that occurred quite recently, showing how easily one may get astray on the heat units basis. I received an inquiry for goods for export, the boiler was specified to produce 41,000 calories—say 164,000 units in twenty-four hours; fortunately they also mentioned the number and size of radiators required, and from this data one of my staff selected a boiler, and, basing his calculations on the quantity of water in the radiators, worked out the power of the boiler as 700,000 heat units, or if 4in. pipes were used, 1,400,000 heat units, because 4in. pipes contained twice the amount of water as that contained in the radiators. For my own satisfaction I worked out the power on the basis of the quantity of water that could be boiled in twenty-four hours with the boiler specified, and found that instead of 164,000 units as specified, or 1,400,000 as calculated by one of the staff, the actual power was 16,000,000 units, i.e., twelve times the one, and one hundred times the other. This may be an exceptional case, but it was taken from actual experience and shows how easily one may be misled on the heat units basis. The goods were supplied and might have led to serious consequences if a boiler had been supplied as specified, capable of producing 164,000 units instead of 16,000,000 units. Now, if the recognised methods are at fault, what is the remedy? I fear I cannot answer that question now, I can only hint at what may prove a satisfactory solution.

This may be obtained either by a series of experiments in different buildings, under varying conditions of temperature and widely different glass or cooling surface, which could only be done at a great cost, or by a few leading engineers taking careful tests from actual work done, comparing notes, and verifying the results so that all may benefit.

Four points should be observed in arriving at any conclusion:—

(1)—The rule should be simple, and one in which the data can be readily obtained.

(2)—The outside temperature and inside temperatures should be specified.

(3)—The water temperature should also be given.

(4)—The rule to apply if possible to any building, whether brick, wood, iron, or glass; this is not absolutely necessary and would probably be unworkable in glass buildings as the range increased, i.e., the greater the difference between the inside and outside temperatures.

Some time ago I adopted the following rule

for 60deg. Fah. inside, when 30deg. outside water temperature 160deg. to 170deg.

Allow 1ft. super of heating surface per 10 cubic feet capacity, and add 1ft. super of heating surface per 6 square feet of glass.

And a similar rule for the American climate to give 70deg. Fah. inside, with zero outside water temperature 170deg.

Allow 3ft. super of heating surface per 10 cubic feet capacity, and add 1ft. super of heating surface per 4 square feet of glass.

Now, I cannot vouch for the accuracy of these rules, I have had no means of testing the latter, because in England we rarely get zero temperature, but so far as I have been able to test the former, and I have applied it to horticultural, and to brick buildings, varying in size, I have not yet found any glaring discrepancy such as applies to the previously mentioned rules; we will assume that a rule on this basis can be established as approximately correct, the basis of calculation is simple, and the necessary data would be generally obtainable.

Now, in my opinion, however complex the rule or the calculations may be, you will never obtain absolute accuracy in rooms varying in size, construction, aspect, temperature, &c. and the more complex the calculations, the greater the liability to error.

Let us suppose that a satisfactory rule has been obtained for a temperature of 60deg. inside when 30deg. outside. This result shall be called unity, or one. Then a table of multipliers, in decimal equivalents, varying in an arithmetical progression for every 5deg. may be obtained for the relative proportions of pipe surface for varying temperatures, whether higher or lower, inside or outside, the exact ratio being ascertained by careful tests or experiments.

Let me point out here what has appeared to me the weak point in all the published rules or tables that have come under my notice. I think most of you will admit that every 5deg. added to the inside temperature will require more pipe surface to maintain than was necessary for the previous 5deg., assuming the pipe surface to be the same temperature. There are three causes to account for this.

(1)—The nearer the temperature of the room approaches that of the pipes the smaller will be the amount of the heat abstracted or withdrawn from the pipes to the room.

(2)—The greater the difference between these temperatures, the greater will be the amount of heat given off from the pipes to the room.

(3)—The greater the difference between the temperature inside and outside the room so the loss through walls, windows, &c., will be proportionately increased.

This may at first appear a simple elementary statement of fact, but I wish you to grasp the importance of this fact, for it appears to have been ignored or lost sight of by most writers on this subject.

Let me explain. If 13ft. of surface will give 60deg. temperature in an ordinary room, and 17ft. super. will give 65deg., that is an increase of 4ft. of surface for 5deg. increased temperature; also a temperature of 100 degrees will require 112ft. of surface, and a temperature of 105deg. will require 132ft. of surface or 20ft. more surface for 5deg. increase of temperature, i.e., five times more surface for an increase of 5deg. from 100 Fah. than is required to give an increase of 5deg. from 60 Fah. Now for every 5deg. increase between the 60deg. and the 100deg. the rate should be progressive or at least have some approximation to an arithmetical progression.

Now up to the present I have not met with any rule or table that complies even approximately with these conditions. For instance take Mr. W. J. Baldwin's rule "Hot Water Heating," page 86, on the feet super. of glass Mr. F. Dye's "Hood on Warming," page 238 on the cubic feet of air per minute. Mr. J. Keith's rule, page 66, on the feet super. of glass.

When these three rules were applied to a room in which I had by actual experiment ascertained that 112ft. of surface were required to give 100deg. temperature, the calculations from the three rules respectively

\* A paper read before the Institution of Heating and Ventilating Engineers.

ave Baldwin 47-3ft., Dye 22-1ft., Keith 66-3ft., against 112ft. required by actual tests taken, and further, that all three of these rules for temperatures of 80deg. and upwards were underrated to such an extent, as to land any engineer who trusted to their accuracy in heavy out of pocket expenses.

On page 279 in "Hood on Warming, 1891," Dye gives a rule showing that an inside temperature of

5deg. requires 1ft. of additional surface for an increase of 5deg. temperature.

0deg. requires 2ft. of additional surface for an increase of 5deg. temperature.

5deg. requires 1ft. of additional surface for an increase of 5deg. temperature.

0deg. requires 25ft. of additional surface for an increase of 5deg. temperature.

5deg. requires 10ft. of additional surface for an increase of 5deg. temperature.

0deg. requires 15ft. of additional surface for an increase of 5deg. temperature.

If one foot of extra surface will raise the temperature from 60deg. to 65deg. it cannot require 25ft. extra to raise the temperature from 65deg. to 70deg., or if 25ft. is required to raise the temperature from 65deg. to 70deg., then it must of necessity require more than 0ft. extra to give 75deg. temperature.

Now I respectfully submit these points for your consideration, and I do so in no carping spirit and with no intention to disparage the usefulness of the general information contained in the works referred to. I simply wish to point out that the tables and rules are not to be implicitly relied upon, and that some revision is an absolute necessity. I am of opinion that "Hood" has been copied and relied upon too implicitly, and that theoretical calculations have been accepted without confirmation by reliable data established from actual experience.

I have prepared a table showing the principle for obtaining varying temperatures (by arithmetical progression) 60deg. inside and 30deg. outside being taken as unity; but I specially refrain from allowing this table to appear in print until it can be verified as fairly reliable.

For tables on the high pressure, or small bore system I think there is also scope for further experiment and development. I know of no published table except the one in my own book ("Heating by Hot Water") that throws any light on this subject, and since that was published I have succeeded in obtaining temperatures that would astonish many of our high pressure experts. I have carried out experiments for heating enamelling stoves with water instead of gas, and have obtained over 600deg. Fah. inside the stove from a hot water circulating apparatus, and I herewith express my indebtedness for getting these results to Mr. Wm. Cook, of Edinburgh, and although his name may not be familiar to all of you, he is the most practical high pressure specialist that it has been my pleasure to meet, and if any engineer living can get better results, I shall be happy to make his acquaintance.

The question of hot water supply is also a most important one, and there is immense scope for improving and developing this branch of the trade. I have come across hundreds of instances, from the ordinary supply from a range boiler for a single bath, to the supply for large public institutions, that have been woefully defective and quite inadequate for the requirements. In one instance at a public hospital, where at least £200 had been spent, no hot water was available and it was carried in buckets from the laundry 100 yards away. I have known very many cases in connection with public institutions where the results have been little less than a public scandal. The amount of ignorance that exists among heating engineers on this simple question is astounding, and some useful and reliable data, as to the form, shape, and size of boiler, the best way of preventing damage by sediment deposit, and the best proportions for the various parts of boiler, mains, cylinders, &c., are greatly needed.

The Tubular Bath Boiler Co., of Gray's Inn Road, have some specialities in this direction that are a distinct advance on any range boiler

apparatus that has come under my notice. I refer particularly to the heating by indirect heat with a coil inside the cylinder, so that the range boiler cannot get filled with sediment.

*Second.*—Now we come to the second need, and I think it should not require much argument to show that we sadly want a journal or periodical devoted exclusively to heating and ventilating, and I think we may take a lesson from our American brothers in this respect: if they wish to ensure the success of any trade, they start a paper. Surely if the laundry trade can support two or three journals devoted to their interests in England, the members of the heating and ventilating trades should be ashamed that they have neglected their opportunities so long.

*Third.*—That a code of rules should be prepared and adopted to safeguard the interests of the trade, and that some step be taken to ensure fair treatment and prevent exploitation.

I have no doubt that this touches many other trades besides those in which we are engaged, and I fear that we are in some measure responsible for it by our over-anxiety to secure orders. Let me mention some of the abuses that ought to be put a stop to, and it is in your power to do it, and that without injustice to yourselves or your clients.

An architect once said to me: "I always get about a dozen tenders for my work; one in twelve is certain to make a mistake." "And do you take advantage of that mistake?" "Yes, certainly," he replied. He considered that business, I call it dishonesty, and think that even a stronger term would be admissible. You frequently see advertised "Contracts open, tenders invited." I don't know what your experience is. Mine has been that it is not worth the trouble to quote for advertised contracts. You may see "Estimates Wanted for Public Buildings; Plans may be seen at the Clerk's Office." You are expected to travel 50, 100, or 150 miles simply for the privilege of quoting. I find in these cases it pays better to stay at home.

Yet another method. A plan of a building is submitted. You are asked to submit a scheme and estimate for the work, after which your plan is submitted to some competitor to trade on the experience that may have cost you hundreds of pounds and taken years to acquire. Or still worse, you are requested to go or send 50 or 100 miles to take a plan, and prepare estimate for heating a church. You do it, and after all your trouble your plan is submitted to some other firm, and if they happen to be lower in price you are simply robbed of your time and expenses.

Let me quote two or three cases of shameful treatment, and my experience is by no means exceptional, because this sort of thing is too common, and should be prevented.

I was requested to prepare a scheme for an engineers' institution in South Wales, and after preparing five sets of plans, five separate estimates, and making three journeys of 100 miles and back again, the order was placed with a local man without even an intimation that the order had passed. I only regret that I did not send in a bill for twenty guineas and sue them as a test case.

Another. Five engineers were asked to examine and report on an installation of heating and hot water supply, with a view to giving better results, and reducing the fuel consumption at a workhouse where there were five large blocks of buildings, and the fuel consumption averaged forty-six tons per week the year round. I offered to give a written guarantee to cut down the fuel consumption twenty tons per week, payment on results, and although a large committee passed a resolution recommending my tender for adoption, it was shelved, and the other four reports and tenders were similarly treated, although the out of pocket expenses of the five engineers would be something like £10 each. You have probably had somewhat similar experiences.

In several instances where plans marked with the name of well-known heating engineers have been sent to me for quotation, I have declined to quote, and returned the plans with a letter giving my opinion of such despicable meanness, and stating that a copy of the letter

has also been sent to the engineers whose name appeared on the plan.

If you will all do the same it will not take long to put a stop to such shameful practices.

Let me give you some methods that I have adopted, that have proved satisfactory to my clients and myself. I get a great many applications to send representatives to take plans of buildings, to give advice and estimates of the cost for heating and hot water supply. I reply on a printed form stating that the fee is from half-a-guinea to five guineas, according to the distance and the work required, and I make no exception to this rule. The results have been eminently satisfactory. The terms have been complied with in over one hundred instances, and in 80 per cent. the orders have resulted. I have had a few instances where the applicants objected to comply with the terms mentioned, and in most cases of objection I have afterwards found that the trouble and expense have been saved, and that any prospect of success would have been exceedingly remote.

*Fourth.*—That the members of this Institution should work together, assist each other, and not stoop to the meanness of taking an unfair advantage of other members of the trade.

Now, I fear that I am treading on very delicate ground, yet there are so many tricks in trade, and methods of practising little deceits, and acts of meanness that are quite unworthy the members of this important craft that it would in itself make a good subject for another paper, and at this stage I shall refer to them as briefly as possible.

I have frequently given advice, prepared plans, schemes, and estimates that have afterwards been submitted to others, and the order placed elsewhere, because of the client's dishonesty, or the unscrupulousness of the competitor.

I have also received plans prepared by other engineers, with their names stamped on them; in all such cases I have refused to quote, unless the engineer has been paid for his trouble.

All the tracings sent from my office are now stamped thus:—

THIS DRAWING OR TRACING IS SUBMITTED BY  
JONES & ATTWOOD,  
OF STOURBRIDGE,

Only on the following Conditions.

- 1.—That it shall not be shown to Competitors without our WRITTEN CONSENT.
- 2.—Consent may be obtained, and the plan submitted to open competition upon PAYMENT to us of 5 per cent. on the net amount of our estimate.
- 3.—If no payment is made, or no order results, the PLAN to be RETURNED to us within ONE MONTH.
- 4.—If you object to comply with these conditions KINDLY RETURN plan forthwith.

PLAN No. ....

and it is exceedingly rare that anyone takes exception to it. You are at liberty to adopt this method also if it meets with your approval, and I make no charge for the suggestion.

How often have you been tempted to cut prices by some such remark as: "Oh! I have a lower estimate than yours," or "Mr. Blank specifies a larger boiler than yours, and quotes a lower price, but I should prefer that you did the work." In cases such as these I often reply, I strongly advise you to give Mr. Blank the order.

Another abomination is to procure a fine cut price, and after screwing you down to the lowest possible figure, to insert in the order some guarantee of temperature, or penalty clause for non-completion in a specified time.

Well, gentlemen, it is for you to combine and formulate some scheme to prevent this sort of exploitation.

In conclusion, let me remark, the subject of this paper is heating and ventilation; the latter is conspicuous by its absence, and at the far end of a paper it would be sheer folly for me to attempt to deal with it. In the first place I don't pretend to know much about it, and I fear that in this respect I am not alone, and that judging from the results obtained in some of our public buildings, law courts, town halls, &c., that many of us are in the same unhappy condition. I propose to leave this part of the subject to others who are better qualified than I to deal with it. I will simply remark that heating and ventilating are closely related, and, like twin sisters, when they disagree, mortification is the result, but

when properly regulated, satisfaction prevails. The heating engineer of the future will have to combine ventilation also, and that in large buildings, public halls, churches, schools, factories, &c. Heating plants fixed outside or underneath the buildings will be largely used, the warmed air being forced over hot-water or steam pipes, on what is known as the Plenum system, by means of fans driven by steam, gas, or other motive power, and the development of electricity in the near future will be such that fans, electrically driven, will be largely used in residential property in combination with some system for hot water or steam heating; architects will have to make provision for this in new buildings, and instead of "Plumber and Hot-Water Fitter," the "Heating and Ventilating Engineer" will become a necessity. Well, gentlemen, I trust the members of this Institution will grasp the situation; let your motto be good work well done with fair remuneration. Better lose an order than lose the confidence of a customer; give close attention to small things, so that every completed contract will be a standing advertisement. Do not deery others in the same trade. Try to lead, let others follow. Don't expect all the patronage, but do your best to deserve it.

## Surveying and Sanitary Notes.

**Fleet Street Widening.**—The Court of Common Council decided at its meeting last Thursday to acquire certain ground in Fleet Street for £10,000 in connection with the widening scheme.

**Moreton-in-Marsh Sanitation** was the subject of a Local Government Board inquiry last week, when Colonel Durnford went into an application by the Campden Rural District Council for power to borrow £300 for works of water supply for the town. There was no opposition.

**Tong Improvements.**—A Local Government Board inquiry was held last week by Colonel C. H. Luard, R.E., into an application by the Tong Urban District Council to sanction the borrowing of £3,000 for the improvement of the south side of Tong Street and the east side of Cutler Heights. Mr. W. K. Plunkett, clerk to the Council, stated that the length of Tong Street was 1,824 yards, and the length of Cutler Heights was 1,084 yards.

**Tiverton Sewerage.**—A Local Government Board inquiry was held by Mr. H. Boulnois last Wednesday into the Town Council's application for sanction to borrow £6,750 for purposes of sewerage and sewage disposal, and £500 for the purchase of Little Silver Cottage and Orchard for use as a store yard, repayment of the loan to be extended over forty years. After the usual formal evidence the inquiry closed.

**Proposed Improvements at Stoke-on-Trent.**—Mr. W. A. Ducat held a Local Government Board inquiry into an application made by the Town Council for permission to borrow £2,700 for the improvement and drainage of Hartshill Road, £2,500 for market purposes, £1,600 for the public baths, £1,100 for works of surface water drainage, £1,350 for the purpose of technical instruction, and £650 for works of sewage disposal, making a total of £9,360.

**L.C.C. Loans.**—At the meeting of the London County Council on Tuesday last week the Finance Committee recommended, and it was agreed, that the Council lend the Newington Vestry £10,000 for electric lighting purposes; the Shoreditch Vestry £10,820 for sewerage, paving, and other works, and £9,400 as balance for the building of model dwellings; the Battersea Vestry £18,864 for paving works; and the Hampstead Vestry £5,636, the Islington Vestry £4,200, and the Lambeth Vestry £4,000 for paving works.

## Builders' Notes.

**The Dundee and District Master Builders** held their annual excursion last Wednesday. They visited St. Andrews and had a very enjoyable time, notwithstanding the wet weather.

**The Bristol Master Builders' Association** members paid a visit to that breezy district known as the Quantocks on Tuesday, last week, and very much enjoyed themselves.

**The Tenders for the Temporary Fire Station** at Tooting, which were accepted at last week's meeting of the London County Council, were as follows: For the brick foundations, drains, &c., £214, and for the superstructure £242 10s. The first tender was submitted by Messrs. Harding and Son, and the latter by Messrs. Croggon and Co., Ltd.

**The Contracts for the New Municipal Offices** to be erected in Bow Street, Keighley, were let last Wednesday afternoon, the following being successful:—Masonry, T. Moore, Keighley; joinery, Ineson Taylor, Lees; painting, Tillotson and Harrison; plumbing, J. Jackson; slating, T. Nelson and Son, Bradford; plastering, Bradley, Krischke, and Co., Bradford; heating apparatus, Barley and Clapham.

**Extension of Dundee Dead Meat Market.**—The Markets Committee of Dundee Town Council yesterday accepted a tender for the painter work of the Slaughter-Houses, the sum amounting to £71 10s. The acceptance of the following approximate tenders for the extension of the Dead Meat Market were also authorised:—Mason and bricklayer work, £1,424 19s. 7d.; blacksmith and ironfounder work, £386 10s. 6d.; carpenter and joiner work, £243 4s. 9d.; painter work, £38 13s. 8d.; plasterer work, £16; plumber work, £91 7s.; and slater work, £97—total, £2,247 15s. 6d.

**Workmen's Compensation Act: Interesting Case.**—In the Westminster County Court, on June 26th, the case of "Henley v. Young and Co." came before His Honour Judge Lumley Smith, Q.C., under the Workmen's Compensation Act. Plaintiff sought to recover seven week's pay at £1 a week. Henley is a carpenter, and, having finished the job on which he was engaged, was given notice. According to the rules of the trade he was entitled to one hour's notice for collecting his tools and one hour's pay for grinding them. During the hour allowed for collecting his tools he fell down a hole and injured his ribs. He had collected his tools. It was contended on behalf of the respondents that the accident did not occur while he was working for them. He could have collected his tools at once, drawn his money, and left the job. His Honour held that during that hour the workman was still in the service of the employers, but in this case the accident was not in the course of any act of service to the employers, and therefore there would be judgment for the respondents.

**Arbitration Proceedings** were commenced at the Middleton Hotel, Ilkley, last Thursday, in connection with a claim made against the Ilkley District Council by Messrs. Braithwaite and Co., contractors, of Leeds, for a balance of £838 which they allege to be due under a sewerage contract which they carried out at Ben Rhydding. The claim had been the subject of previous litigation, and at the instance of the Court of Appeal the president of the Bradford Surveyors' Society had appointed Mr. Charles Jackson, architect, Manchester, as sole arbitrator.—Mr. Simpson, for the claimants, in opening the case, said that the most important part of the claim was in respect to what they alleged to be rock work. A clause was inserted in the contract to the effect that the claimants should be paid extra for cutting through rock, and the point upon which the case seemed to turn was whether

the material in question was entitled to be considered as rock. Albert Braithwaite, a member of the claimant firm, gave evidence with regard to the excavations. Generally, he said, the nature of the soil they had to go through was clay and rock, the latter consisting of very hard sandstone. It was necessary to use the appliances generally employed in rock work. Cross-examined, witness denied having said to Mr. John Waugh, Bradford, who supervised the work, that certifying for rock would make no difference to him (Mr. Waugh), whilst it would be a serious matter to himself, and if he would agree to certify for it, he (witness) would see that it was to Mr. Waugh's benefit. Expert evidence was given to the effect that the boulders which had to be dealt with in the excavations should be considered as rock. The proceedings were adjourned.

## Engineering Notes.

**The East London Water Bill**, the object of which is to give the East London Water Company power to take further water from the Thames, and to spend £1,400,000 in new works, was rejected by the Select Committee of the House of Lords last Wednesday.

**Edinburgh Electric Lighting Extension.**—The Electric Lighting Committee of the Town Council have recommended the acceptance of estimates for the extension of the boiler house at Dewar Place Station, amounting to just over £2,000, and estimates for the formation of a siding at M'Donald Road Station at over £2,000.

**Southend Light Railway.**—At the beginning of last week Sir Courtenay Boyle heard the objection of the Leigh Urban District Council to the confirmation of the order for the making of about six miles of light railway in Southend and the Leigh Urban District. The Corporation of Southend were the promoters, and the Urban District Council wanted the Board of Trade to insert a clause binding the promoters to widen a road to a minimum of 23ft., and to complete the whole of the light railway within three years. The Corporation objected to widen the road for the benefit of the Urban District Council, especially as that Council could at the end of ten years take over the railway. Sir Courtenay said it was a strong thing to go into another local authority's district without their consent, but the Corporation were justified in resisting the claim of the Urban Council to pay for the widening of the road. He adjourned the case for the parties to come to some agreement.

**Frauds on Engineers.**—At the Cheshire Quarter Sessions last Wednesday, Henry Cleaver, described as a consulting engineer, was sentenced to twelve months' hard labour for obtaining one guinea by false pretences from Messrs. Stanley, Davies, and Pollard, electrical engineers, Hyde, Cheshire, and for attempting to obtain £25 from them by similar means. Cleaver advertised for tenders for an electrical installation generator's engine, boilers, &c., for Reading, Berks. One hundred and nine firms sent the usual guinea fee, which was not returned. In almost every case they received specifications, accompanied by a request from Cleaver for sums varying from £10, on receipt of which he promised to give them the contract. He asked Messrs. Stanley, Davies, and Pollard for £25, and another £25 on signing the contract. They grew suspicious, and he was arrested. It then transpired that no such works were being erected at Reading, and that Cleaver was a bankrupt and a gambler. One hundred and nine letters were found at his lodgings relating to postal orders and cheques he had received in connection with the bogus contract. Cleaver denied having acted fraudulently, and said he had worked on the scheme for fifteen years. The Judge described it as a deliberate swindle concocted by a man of great ability.

# Masters and Men.

**About Two Hundred Labourers** employed by two Aberdeen timber merchants have struck for an advance in wages from 5d. to 6d. per hour. They base their demand on the fact that the labourers employed by stevedores in discharging the cargoes are paid 6d.

**A Complaint from the Greenock Joiners' Society** was heard at a meeting of the United Trades' Council last Thursday evening. It was said that a Port-Glasgow firm, which had obtained a contract from Greenock Corporation, was employing labourers to do work which properly belonged to joiners—namely, making boxes required in connection with the electricity works. It was decided to instruct the secretary to call the attention of the town clerk to the matter.

**Building Trades Dispute.**—A specially-convened meeting of the Yorkshire Federation of Building Trades was held at Leeds last week to consider a letter received from the London Order of Bricklayers, which was dated June 23rd, and ran as follows:—"At a conference of delegates from our Yorkshire branches, held in York yesterday, I was instructed to write your association requesting them to recognise a deputation of five delegates, with a view to the settlement of the present dispute. Kindly give me due notice of time and place if your association are prepared to receive them, in order that I may acquaint the delegates." In answer to this communication the Yorkshire Federation said that they could not see how a partial conference would do any good, but were quite willing to meet them along with one representative from each union. They offered, if this conference were arranged, to withdraw the lock-out conditionally upon all the men returning to work to their old masters, whether locked-out or on strike, upon the old condition of wages, pending a settlement. The members of the Hull Master Builders' Association are still determined to carry on the fight until they win, and they complain that builders in other parts of the country do not appreciate the grip which the operatives have hitherto had upon them.

# Trade and Craft.

**CHARTERIS AND LONGLEY.**  
This firm manufacture a perfected system of wood block flooring, which stands out conspicuously from among the many other good floorings in the market because it is firm, durable, sani-

section of the flooring, which is securely bound together with the firm's special mastic composition. When wood block flooring is laid over hot-air, gas, water, or other pipes, it is a great disadvantage not to be able to get at them without disturbing the whole floor. Messrs. Charteris and Longley have recognised this fact, and have, therefore, another system of wood block flooring, called the "B" system,

FIG. 1.

FIG. 2.

tary, noiseless, rot-proof (the timber being specially seasoned and treated before leaving their factories), and fire-resisting qualities. As will be seen from Fig. 1, each block is dovetailed and rabbeted on the bottom at A A and continued to form tongues at B B. It will be at once understood that when the blocks are laid the tongues B B enter the dovetail rabbets, and bind them together in such a way as to prevent the removal of any block without displacing the whole floor. Fig. 2 shows a

by which it is only necessary to unscrew a border and some specially long blocks can be lifted to enable easy access to whatever is beneath. Every piece of wood used by the firm is treated in the "Shapland" kilns, and this fact alone is a guarantee of its goodness. Messrs. Charteris and Longley, whose head offices are at 31 and 32, King William Street, London, E.C., have always a large stock of blocks of all sizes, woods, and patterns at hand, and can generally execute orders at three to four days' notice.

## Property and Land Sales.

**HIGHAM PARK, WALTHAMSTOW.**—The very valuable freehold building estate of nearly 40 acres, known as Higham's Farm, beautifully situated contiguous to the well-known Higham's Park Woods and Lake (one of the prettiest portions of Epping Forest), adjoining Woodford Golf Links, and seven minutes from the railway station, the whole being admirably adapted for development as a residential building estate.

**MESSRS. KEMSLEY** will **SELL** the above by **AUCTION**, in One Lot, at the Mart, on **FRIDAY, JULY 21st**, at Two.

Particulars of **E. OLIVER, Esq., Solicitor, 1, Corbet Court, E.C.**, and of the **AUCTIONEERS, 41, Bishopsgate Street Within, E.C.**, and at Woodford Green and Romford. 1

**MONDAY, JULY 10th, 1899.**—**TELSCOMBE CLIFFS** LAND SALE, between Brighton and Newhaven.—160 choice Seaside Building Sites will be sold in a marquee on the estate at Half-Past Two p.m. Payments by instalments. A special train of first-class carriages will leave Victoria at 10.5 and London Bridge at 10, calling at Clapham Junction and East Croydon. Return tickets, including luncheon, 5s. may be had of the Auctioneers.

**MESSRS. HARMAN BROS.** have been favoured with instructions from the Cavendish Land Co. Limited, to **SELL** by **AUCTION** the Third Portion of the above estate, on **MONDAY, JULY 10th**, at **HALF-PAST TWO**.

Particulars and plans may be had of Messrs. **WARD, BOWIE, and Co., Solicitors, No. 7, King-street, E.C.**; of Messrs. **HOOKER and WEBB, 4, High-street, Croydon**; of Messrs. **FAIRBROTHER and Co., 26, Queen's-road, Brighton**; of the **CAVENDISH LAND CO. LIMITED, 68, Victoria-street, Westminster**; and at the **AUCTIONEERS' Offices, 75, Aldermanbury, Guildhall, E.C.**

**WEMBLEY HILL ESTATE** (near Park and Tower).—Sixty lots of very valuable **FREEHOLD BUILDING LAND**, free from tithe and land tax, in a rapidly-increasing, convenient, and accessible district near Sudbury (L. and N. W. K.) and Wembley Park (Met. Railway) Stations. Some of the lots having frontages to Harrow-road are suitable for shops, and others with frontages to a new road, well sewered and kerbed, afford choice sites for villa residences, which are greatly in demand. The property being ripe for development offers an opportunity for the creation of ground rents. Gas and water obtainable. Purchase money by instalments, with 10 per cent. deposit.

**MR. WALTER HALL** will **SELL** the above by **AUCTION**, at the **WILLESDEN JUNCTION HOTEL**, on **MONDAY, JULY 10th**, at **SEVEN** precisely.

Particulars of Messrs. **WOODBRIDGE and SONS, Solicitors, Uxbridge**, and **7, New-square, Lincoln's Inn, W.C.**; and of the **AUCTIONEER, 38, Chancery-lane, W.C.**

SALE DAYS for the Year 1899.

Messrs.

**FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO.** beg to announce that the undermentioned dates have been fixed for their **AUCTIONS** of **FREEHOLD**, **Copyhold**, and **Leasehold ESTATES**, **Reversions**, **Shares**, **Life Interests**, &c., at the **AUCTION MART, Tokenhouse-yard, E.C.**

Other appointments for intermediate Sales will also be arranged.

Thursday, July 6	Thursday, Oct. 12
Thursday, July 13	Thursday, Oct. 26
Thursday, July 20	Thursday, Nov. 16
Thursday, July 27	Thursday, Nov. 23
Thursday, Aug. 3	Thursday, Dec. 7
Thursday, Aug. 10	Thursday, Dec. 14
Thursday, Sept. 21	

Messrs. **FAREBROTHER, ELLIS, and CO.** publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 19, Old Broad-street, E.C.

By order of the Executors of the late owner. The valuable **FREEHOLD PROPERTY** known as "Royal Dockyard Wharf" Lower Woolwich-road, S.E., together with the Fixed Plant and Machinery and Goodwill of the old-established **TIMBER and BUILDERS' MERCHANT'S BUSINESS**, as a going concern, and the LEASE of the adjacent Waterside PREMISES, known as "Mast Pond Wharf," will be offered for **SALE** by Public **AUCTION** in One Lot by

**MESSRS. BRADSHAW, BROWN, and CO.** at the **MART, Tokenhouse-yard, E.C.**, on **TUESDAY, JULY 25th, 1899**, at One o'clock precisely.

The Freehold Property (built by the British Government) has a granite embankment to the River Thames of about 400ft.; and a frontage of about 42ft. to Lower Woolwich-road, with three cartway entrances therefrom, and comprises an area of about 2½ acres. Two granite-paved slipsways, one 235ft. long, 53ft. wide.

"Mast Pond Wharf" has a frontage to the river of about 100ft., and contains an area of about three-quarters of an acre.

The Lease has an unexpired term of about seven years, at a rental of £150 per annum.

**JOHN BARLETT, Esq., Solicitor, 26, Bush-lane, E.C.**; Auctioneers' Offices, Billiter-square Buildings, E.C.; and Millwall, E.

**CITY OF LONDON.** City Improvements.—By order of the Corporation. To Brewers, Licensed Victuallers, Restaurateurs, and others. Offering an opportunity of securing one of the finest sites for licensed premises.

In the heart of the shipping, wine, Colonial, and corn trade centres.

The valuable Free LEASE of the important corner Building Site, together with the License thereto attached, now occupied by fully-licensed premises, the Mercantile, and the adjoining property known as 126, Fenchurch-street, E.C.

Having a frontage of about 36ft. 5in. o Fenchurch-street, and about 43ft. 2in. to Fen-court, which is now being widened, and will form an important thoroughfare, with an enormous pedestrian traffic, the whole covering an area of about 1,374 square feet. A free lease for sixty-five years will be granted at the moderate ground rent of £300 per annum.

**MESSRS. DOUGLAS YOUNG and CO.** will **SELL** the above by **AUCTION**, at the Mart, E.C., on **WEDNESDAY, JULY 12th, 1899**, at ONE o'clock precisely.

Plans, particulars, and conditions of sale may be obtained of the **COMPTROLLER of the CITY ENGINEER, Guildhall, E.C.**; or of the **AUCTIONEERS, No. 51, Coleman-street, E.C.**; 313, Clapham-road, S.W.; and Ilford, E. 1

**ANSELL and MALLOWS, Architectural** Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

## An Architectural Causerie.

### Is the Amateur an Advantage to Art?

Is the amateur's increasing pre-occupation with art

and art matters an advantage or not? In considering this question, the effect of his competition with the artist must be left on one side, though that is a considerable factor since it may lessen the encouragement given to the professional artist to attempt great things, and so indirectly affect the matter, for it is the effect upon art and not upon the artist that is in question. At first sight one would say that it must be advantageous. In photography, which its practitioners claim to be more or less an allied art to painting, and which the practice of many painters appears to imitate, the work of the amateur is often better and more artistic than that of the professional; in literature, too, it is not always the man whose profession it is to write who produces the most charming and striking stories, or expresses himself most beautifully, and the amateur in art is free from many necessities which constrain and hamper the professional. For instance, the question of whether his work when finished will find a market, need never occur to him, and he may give himself with a quiet mind to producing the absolute best, as far as he is capable of so doing; and if he should wish to express his thought in a rich and expensive material, or require costly things to copy or to use as suggestion, it is easy for him to procure them since he does not have to consider whether the expense is justifiable. And while every professional man's imagination tends to become case-hardened and to run in certain grooves, the amateur's fancy, being quite unfettered by necessities and less staled by constant use, should be fresher and less conventional, so that the charm of unexpectedness might reasonably be looked for in his conceptions; and he should be the inventor, whose ideas might be taken up and fruitfully worked out by others. On the other hand, his lack of technical training is likely to lead him to attempt things which are beyond the possibilities of the material which he is employing, and to conceive of effects in one craft which can only be produced by the combination of several; and even when the imagination has not conceived such impossibilities it is often the case that his training has not been sufficiently severe to enable him

to fully express what he desires, so that his work may fail of the impressiveness which it would have if the execution did not lag behind the conception, and of the admiration which under happier circumstances would be its meed. For too much liberty sometimes renders the imagination sterile, and the craftsman who knows his craft and the material in which his designs are to be executed often finds stimulus and suggestion in the very limitations which to the amateur or the half-trained man are vexatious and hampering. When the amateur has given sufficient time and attention to any craft to

analysis to have its roots in some design made centuries ago by some unnamed craftsman, and to be merely a fresh development from one of those unnoticed impressions which the sensitive brain of the observant man is continually recording with automatic precision. And this no doubt is the reason of the curious feeling which often comes over the designer, when, having made a thing which he recognises to be good, he is beset with the impression that he has seen it before somewhere, an impression which is sometimes so strong as to make him doubt his own originality.

S. S. G.

CAWSTON CHURCH  
NORFOLK

NAVE ROOF OF CAWSTON CHURCH, NORFOLK. DRAWN BY J. HERVEY RUTHERFORD.

enable him to master its difficulties and gain the suggestiveness which underlies them, his work is indistinguishable from that of the professional, and in fact he becomes professional to all intents and purposes, save that he does not, or at least did not, compete in the market. The extravagances of amateurs are occasionally suggestive to the trained eye, but at this late period of the world's history it is exceedingly difficult to conceive anything which shall be at the same time new and good. Plenty of apparently new things appear, but anything which strikes one as good is generally found on

### Cawston Church, Norfolk.

THE illustration on this page is a sketch of the nave roof from the roof loft of Cawston Church, Norfolk. This roof was originally painted, but few scraps are now left to show it. The sketch was one of a number by Mr. J. Hervey Rutherford, of various subjects, which were submitted this year for the Pugin Studentship prize granted by the Royal Institute of British Architects, and were placed first by the examiners. Others of the series are illustrated in our issues for February 8th and 22nd, and further sketches will appear in future issues.

## Architects and Engineers.

THE association of architects with engineers is more necessary now than ever.

The old builders were essentially "all round" men; construction, artistic design, utility, sculpture, decorative detail—nothing escaped their eye, nothing was too large or too small, too prosaic or too poetical, for them. Such a unity of art cannot be expected now, but co-operation in the arts is indispensable, and Pugin's theory of architecture holds good for all time; we must build "ornamented construction, not constructed ornament." Our older engineers, the men who founded the great profession of civil engineering, though not aiming at the æstheticism of the Classic or Gothic builders, had yet something of their spirit; they did not separate use from beauty; in their designs they had some regard to surrounding structures. The rigid separation of professions is becoming very injurious to London; what sort of designs should we have had if it had prevailed when the two finest of the Thames bridges were built? Here are two simple effective designs both due to architects: in our day they would probably have been entrusted to engineers; would the result have been as satisfactory? The truth is that engineering should not be allowed to elbow out architecture; better far that architecture should extend its influence over engineering. The elder Rennie gave London Waterloo Bridge, a monumental structure in which he showed himself to be both architect and engineer; with nine equal elliptic arches, each of 120ft. span and Doric columns in pairs, though not strictly coupled, flanking every pier. The whole effect is exceedingly grand, and drew from Canova the remark that it was one of the three things which were worth coming to London to see, the other two being Somerset House, with which it combines, and Wren's church of St. Stephen's, Walbrook. Sir John Rennie, his son, designed London Bridge, with its five arches, also elliptic but unequal, the centre arch of 152ft. 6in. span, the two next of 140ft., and the two outer ones of 130ft.; severely simple, and with a certain business-like plainness not unsuited to "the City;" at either end a fine tower enters into the view—St. Magnus with its light lantern, cupola, and spire, on the Middlesex shore; St. Saviour's Gothic pinnacles on the Surrey side. These two great bridges may be contrasted with Blackfriars Bridge, which lies midway between them; more ornate, but not more telling, with red granite columns, capitals representing Thames waterfowl—an excellent piece of detail—and a cast-iron balustrade; at either end are immense pedestals for statuary which, of course, remain untenanted. It seems incredible that almost immediately adjoining it to the east a railway bridge of the most commonplace design has been allowed to raise a hideous network of lattice girders, and immediately beyond it another whose design is no better; the view of the bridge being quite ruined, and a fine architectural vista reduced to chaos. Surely here was a case of "how not to do it." Parliament and the Corporation of London must take the blame for so shameful an injury to London's river; the architects and engineers, if left to themselves, could have struck out something better than this. It certainly exemplifies the evil effects of treating use and beauty as two separate and even hostile influences; no vast collections in museums, no "Science and Art Department," can atone for the public injury inflicted by this ridiculous fiasco, to which Europe presents no parallel.

J. C. P.

## On Reflection.

### "Overloading" Quantities.

SOME rather queer proceedings were brought to light in the course of an action decided last week at Liverpool. The Tenth Board of Guardians sought to recover from Messrs. C. O. Ellison and Son, architects, of Liverpool, the sum of £1,563 for alleged professional negligence. The case occupied the attention of Mr. Pollock, Q.C., the official referee, for five days, but the main facts may be briefly stated. Messrs. Ellison were employed by the Board of Guardians to carry out a design they had submitted in competition for the extension of the infirmary buildings. Colonel Ellison, the principal partner in the firm, in accordance with his usual practice, made out his own quantities, and on the basis of these quantities tenders were invited, and that of Messrs. Kelly Bros. for £34,909 was accepted. The quantities, it was alleged, were "overloaded" to the extent of £1,065, so that the Guardians had to pay that sum in excess of what they would have paid had the quantities been properly taken out. Moreover in the carrying out of the work cheaper methods of construction were adopted; instead of the glazed brickwork mentioned in the quantities which was to be employed for lining corridors, kitchens, and sculleries, the defendants allowed the contractors to use to a great extent salt-glazed bricks and plastering; yet no deduction was made in the certificates, the Guardians being charged with the full amount. In a second contract between the Guardians and Messrs. Kelly to build three additional pavilions for the infirmary, it was alleged that certain brickwork mentioned in the bills of quantities was not carried out, although paid for. The figures of the clerk of works showing that the quantities were overloaded by £1,065 were not disputed by the defence, and the official referee, holding that such overloading constituted gross negligence, gave judgment for the plaintiffs for £1,000 and costs, their counsel having intimated that his clients would be satisfied with that amount.

### An Explanation and a Moral.

MR. ELLISON'S explanation of his method of taking out quantities was that he left a margin for contingencies, taking the measurements more fully than was absolutely necessary, because from long experience he found it in the interests of his clients to do so. If quantities were taken out net, the builders, he said, to cover their risk, generally put on a price varying from 5 to 10 per cent.; but if builders knew there was a margin in the quantities they would put the price very much lower. The defence quite failed to prove any such custom in the profession, and it is difficult to see how such a plan can be defended. In the present case the tender of the builder's was admittedly £1,065 more than it would have been had the quantities been properly taken out; we do not wonder therefore that the official referee refused to admit that such an arrangement could be other than inimical to the interests of the client. It is only fair to Mr. Ellison to say that no charge was made against him of any fraudulent intention in the matter. But it is pretty obvious that, if quantities are to be subject

to a fictitious inflation to cover contingencies the door is opened for all manner of shady transactions; an unscrupulous man—and no profession is free from such—might be inclined to increase the quantities in order to increase his own commission, or to enter into a dishonest collusion with the builder for the sharing of profits. Were the profession generally to act according to Colonel Ellison's theories, the architect would be almost inevitably an object of suspicion to those who employed him. In the course of the action comment was made on the position occupied by the clerk of works, Mr. Hallard, who seems to have been appointed not by the architect, but by the guardians; it was suggested that the gentleman acted as a sort of detective to watch the architect and the builder. We cannot see in the evidence much ground for such a suggestion; Mr. Hallard's relation with the architect and the guardians were certainly somewhat unusual, but he seems to have acted with perfect fairness and propriety. Our point is, however, that if architects generally were to condescend to such questionable practices as those admitted by Messrs. Ellison, there might grow up a demand on the part of clients, especially of those responsible for public buildings, that the clerk of works should be independent of and to a certain extent the overseer of the architect. Such a state of affairs would be intolerable to any self-respecting man; the architect must be, like Caesar's wife, above suspicion.

### Prometheus Unbound.

"I CANNOT be fettered by an official position," said Mr. Walter Crane the other day in reply to an interviewer. We are not in least surprised to hear it; we always thought Mr. Crane was that sort of man, and were therefore neither surprised nor disappointed to learn that he had "behaved as such," and resigned his position as principal of the Royal College of Art. When Mr. Crane accepted the position, not without reluctance, he fondly hoped to effect some much-needed reforms. He hardly gauged, apparently, the strength of the forces that make against progress at South Kensington. He had theories about the functions of a national art school, which must have seemed to the authorities quite revolutionary. He actually wanted to introduce some element of practical utility into the studies; if he had his way the students would be trained to become decorative artists, not merely drawing masters. One step in this direction he has succeeded in taking by the establishment of a class for stained glass work. His brief tenure of office therefore has not been altogether barren of result in the direction of reform, and although it would no doubt take several centuries for the South Kensington authorities fully to assimilate his ideas, there is no knowing what progress might be made if only a succession of reforming principals could be assured. Mr. Crane has no doubt effected a stirring of the dry bones, and it is to be hoped his successors will see to it that the faint signs of a new spirit are not allowed to flicker out again. Mr. Crane's resignation is, no doubt, a loss to the students—though he has not altogether severed his connection with the school, nor ceased to be interested in its work—but to the world of Art at large it is undoubtedly a gain, as it allows Mr. Crane, now that he is freed from the irksome restraint of official harness, to devote more time to those literary and artistic labours in which his genius has free scope.

THE SECOND PREMIATED DESIGN. BY HARRY PERCY SHARPE.

## "BUILDERS' JOURNAL" COMPETITION.

### THE DESIGNS REVIEWED.

By EDWARD S. PRIOR.

ONE HUNDRED AND THIRTY-FOUR drawings were brought before me, and I have been asked to make a general report upon this "architectural output," as well as to select what appeared most likely to meet the special demand for which this competition was instituted. The immediate observation must be upon the number of competitors who would seem in feeling or attainment unfitted to put upon paper the idea of a common-sense house. Some seventy drawings, about half of those competing, had immediately to be set on one side; yet, if put upon the site and required to build, instead of to design, one cannot believe that so many would have failed to create something possible. One must, presumably, lay it at the door of the highly artificial conditions of modern architecture that here some seventy professing architects have been found spending each a week of his time in elaborately recording absurd or impossible "designs" for what is a commonplace necessity of life—a simple home to be lived in.

The particular conditions indicated for the guidance of this competition no doubt set a problem of some difficulty, but there was no excuse in them for sending in plans that must cost £10,000; for putting in drawing-rooms and morning-rooms that were not asked for; for arranging great conservatories and aquariums; for magnificent and costly decorations; extravagances, which were most often accompanied by impossible arrangements, ignorant constructions, and general proofs of incapacity to "design." Yet not a few of these seventy, who had immediately to be set aside, were neat draughtsmen, who had expended themselves on many sheets, stretched and framed; upon printings of titles that must have taken many days; upon perspectives of elaborate perversity. Whereas one sheet of plans and elevations with pencil writing was all that was needed to express the idea of the competition—and the idea was the only thing in question! One may say that practically in no case has the perspective been of service in recommending the competitor—in many cases it has emphasised the vulgarity of his conceptions that lay dormant in the elevation; or has thrown a doubt upon the plan by the technical deceit of its picturesque representation.

The given conditions of this house-building made an interesting study; there were to be met special difficulties of plan, of aspect, and of cost. There was asked as to plan, that there should be a "sitting-room hall," two storeys in height, and this in a "long, narrow," and therefore, at the cost, low house made a difficulty, for the required number of bedrooms could not be got directly over the ground floor,

which the accommodation prescribed, and the cost strictly limited. Extravagant ground-floors and passage halls were necessarily ruled out as not attempting to solve the problem; but there were devices of value in putting a best bedroom suite on the ground, or in making the servants' bedrooms come among the offices. Since, however, these seemed to need a special adaptation of habits, which it would be unsafe to assume, preference has been given to the idea of taking some of the bedrooms into an attic, as long as this was managed to enhance and not disturb the desired effect of a "long, narrow" house.

Secondly, as to aspect, it was asked that the principal rooms should look north-west, thus reversing the best arrangement. But since a good aspect is a quality more valuable to a house than any prospect, it has been judged that light and sun must be provided for the sitting rooms as well as this north-west view. The arrangements have therefore been preferred which set the boudoir and study to the south-west and the offices to the north-east, where the drainage could go with least expense; and a twisted ground-plan to secure at once all these advantages has been taken as an eccentricity justified by its practical success.

Thirdly, the cost has been stated as wished for between £1,500 and £2,000. No competitor has sent in a plan that could on any possibility of good building have been completed in the neighbourhood of Hythe for such a sum. It is stated by many that they could build what they propose for 6d. a cubic foot. This is an assertion of such practical ignorance, or insincerity, that as arguing ill for the future practice of the competitor, it has been judged to rule him out. The price of building in the south-east has risen some twenty per cent. in the last three years, so that a country house there can now scarcely be built for 9d. a cubic

foot, and for this price it must be planned and constructed with the knowledge of a practical economist. The condition of cost has therefore been taken to imply the absence in this house of all costly extravagance, the ruling out of all expensive "features," and the provision of simply ordinary good building and ordinary house-fittings. But it is not good building to use deal as external timber work, and solid oak would be found very costly—not cheaper than brick, as some competitors seem to assert. Nor can thatch be assumed to be less costly than tiles. The drawings have, therefore, been judged as they show a practical knowledge of the economical use of their materials. And since for this house the lowest price that could be suggested is £2,500, any plans that come within 10 per cent. of that figure, at 9d. a cubic foot, have been taken as reasonable.

Besides the above three governing conditions there were given suggestions by the employer as to the sort of house he would like—that it should be "long and narrow," of "oak and thatch," with any or every "kind of angle and window," and fourthly, with an individuality in its design which should distinguish it. Such suggestions as these are of great value to the architect, since out of such material the artist in building creates his art. But such instructions must be taken with the common-sense view of the employment of an architect—that he is valuable to his employer, because he has a taste trained to deal with such suggestions as the above, and within the limits of that taste produces an individual creation. Many of the competitors, instead of this sane view, have read in these instructions a free invitation to torture building into "effect" and introduce the "bits of design" that magazines illustrate. Indeed, many of the specifications read as if they were the fashionable puffs of some fashionable architect, where, as ground-bait for clients, "cosy," "quaint," and "mediaeval," jostle one another in every sentence.

One competitor drops into poetry, but adds that he will pay strict "business attention to every detail, if selected!" Such literary expressions have been taken as harmless effervescence, but any signs of "cosiness" or "quaintness" or "mediaevalism," if detected in any plan, have ruled its author out.

Judged upon the above principles of criticism, I have placed the drawings with the mottoes "Yew," "Eros," and "Alfo" as best meeting the conditions. There are faults in all three, but they are such as could be remedied without prejudicing the main ideas. The first has cleverly managed the angle or twisted plan, and the provision of extra bedrooms in a tower, though there are some defects and superfluities in arrangement. A common-sense and workman-like use of oak and thatch distinguishes his construction, and his house could be built for about £2,500. So too could that of Eros, who makes a successful use of timber and tile

THE SECOND PREMIATED DESIGN. BY HARRY PERCY SHARPE.

and gives a compact plan though somewhat marred by the fashionable "nookiness." Alfio, out of thatch and timber, shows a successful idea, but his plan needs overhauling, and as drawn it would cost £2,750. Its suggestions of internal detail are happy. [The design of "Yew" was published in our last week's issue; those of "Eros" and "Alfio" are given in the present number.—Ed.]

The design of "Quex" would be still more costly, but the notion of his plan is good, and his elevations could be much improved by simpler treatment. "Caractacus" shows a sensible oak construction used for a simple and pleasant exterior, but inside his boudoir is all "nooks" and some have strayed into the kitchen, rendering that necessary apartment unusable. "Torso" and "Martello" both have sent attractive and sensible ideas, which might easily have been placed first, if they had been more worked out to reduce their cost. "Pippa" has failed in not making his hall sufficiently a sitting-room. "Thislixum," "Ogee," and "Try" were other designs of interest selected from a class of some twenty-five, which included, besides the above, "Christian," "Quercus," "Barbara," "Gordon," "Simplex," "Thatch I," "Cypress," "Long and Low," "Build," "Red Roof," "Heather," "Black Spot," "Habitable," and

sandfaced bricks and small round oak base and polished oak floor, quaint low-raftered ceiling and low settle, carrying the eye along to the cosy corner, with its stone fireplace and beaten copper hood, is cheerfully and well lighted from four-light windows. The plain wall on the right would form capital space for exhibiting pictures. On proceeding further into the hall, you get a quaint old English effect, with the oak timbers and plaster above the red brick dado and plain architraves giving a substantial and old world air to the hall. Above is the gallery, really forming part of the bedroom corridor, and so situated that it would make a capital music gallery should the occasion arise, and yet it throws a considerable addition into the hall. The hall is well and cheerfully lighted from both ends, and is so planned that tea or breakfast could easily be taken in the ingle nook.

THE DINING ROOM is a well proportioned room, 22ft. 11in. by 16ft. 6in., conveniently placed in relation to the kitchens, and in the event of a large gathering could be used in conjunction with hall and boudoir by throwing open the double folding doors, thus opening up the delightful vista to 56ft. 6in. I would propose eventually to panel dining-room up to a height of 6ft. in dark oak, with plaster frieze and a very small plaster cornice, but the panelling

THE LADY'S BOUDOIR is a quaint room with octagonal end. A pretty little fireplace could be formed on one side of octagon with white marble sides and copper hood.

THE GARDEN is reached from the hall under a spacious verandah, floored with quarries, which would make a delightful lounge in the evening.

THE BEDROOM PLAN is reached by a wide staircase of oak, well lighted by half landing, and the bedrooms open out on to a wide, straight corridor, the end being balustraded to form gallery to hall, the ceiling to be low with exposed joists.

A DRESSING-ROOM is provided in connection with bedroom No. 3, and a wooden hinged window opens into upper part of hall, which would be useful and quaint.

BEDROOMS NOS. 4 AND 5 are *en suite*, and No. 4 would be convenient as a child's room, as it would be under close supervision of anyone in No. 5. No. 5 is a cheerful, airy room for an invalid, and a nurse could occupy No. 4.

THE ATTIC is reached by a small stair off landing, which is shut off with a door.

MORTAR to be one part freshly burnt grey-stone lime from Bredon to three parts clean sharp sand.

SLEEPER walls where necessary.

DAMP COURSE to all walls of slate in cement. Build stout hoop-iron where required at level of first floor and at all plates.

POINT WALLS OF LARDER, w.c., coals, and whitewash same.

FARGE AND CORE ALL FLUES with cow dung. 20-gallon boiler in kitchen. Sink of glazed stoneware with wood drainer. 9in. by 3in. air bricks under all boarded floors. All window cills to have lead drip.

UNDERGROUND CISTERN for rain water, under coals, lined with cement, and to have overflow connected to drains.

WOODWORK.—All constructional timbers, except those exposed to view and wrought, to be of spruce.

Joiners' work, except where otherwise specified, best red deal.

All rafters, studs, and joists 16in. centre.

Dining-room and hall 5½in. by 3in. red deal on sleeper walls.

All joists showing in hall and dining-room, &c., to be 5in. by 4in. red deal, wrought with jack plane only, and to be morticed into beams where necessary. Other joists 7in. by 2½in. spruce, and cross-bridging where possible. All beams, where necessary, either 9in. by 6in. or 9in. by 9in. deal, jack planed.

Staircase and gallery in hall, and all internal and external half-timbering, to be of oak. Oak newels to staircase. Roof to be formed of wall plate 4½in. by 3in. red deal; purlins, 7in. by 4in.; gutter board, 1in.; flashings, ½in.; valleys, 11in. by 2½in.; ceiling joists, 3in. by 2½in.; rafters, 4in. by 2in.; notched and spiked to wall plate.

Upper floors, 6in. by 1in. red deal; lower, where not otherwise stated, to be 4in. by 1in. red deal.

Windows in general to be formed of 5½in. by 3in. frames; 3in. oak cill to have projecting lead; cill under 2in.; sashes to open outwards.

The whole work to be finished in a tradesmanlike manner from ½in. details and full-size drawings.

### THE THIRD PREMIATED DESIGN.

The following is the description and specification accompanying the plans submitted by the winner of the third premium, Mr. William Mitchell ("Alfio").—

These drawings have been prepared with due regard to the conditions of competition. It has not been thought advisable to make too many corners, &c., such as ingles to the fireplaces, and a lavish amount of oriel windows, because with the accommodation given in the conditions, one can only arrange the rooms in a most comfortable manner; also with the idea of having the elevational construction as simple as possible, so that in cubing up the contents it may come within the limit of £2,000.

The various rooms, hall, dining-room, study, boudoir, have been arranged on plan with respect to their aspect.

The hall has been planned as a means of

THE SECOND PREMIATED DESIGN. BY HARRY PERCY SHARPE.

"Casement." These last, though all with merits, were judged upon some point or other to have strayed too widely from the common-sense of the conditions. Another batch of some forty were considered as not quite reaching the level of the above, and, finally, some seventy seemed convicted of some patent extravagance, which might have occurred to their authors as such.

### THE SECOND PREMIATED DESIGN.

The following is the description and specification accompanying the plans submitted by the winner of the second premium, Mr. Harry Percy Sharpe ("Eros").—

The drawings show a quiet design based on the old half-timber houses of the mediæval times, and, in accordance with requirements, is kept as low as possible, the overhanging eaves in most cases coming down to bedroom floor level. It is proposed to treat the exterior in stucco all over, with wood timbering of oak dressed with oil and left to gather a natural colour from atmospheric effects. All exposed brickwork to be built of 2in. sand-faced bricks, with ½in. joints built Old English bond. The roofing is shown on the drawing as tiles, but thatch would suit the design equally well. A sundial is shown on the south-west elevation.

THE PLAN.—On entering through the cosy porch, which is provided with a seat and could be used as a shelter from the morning sun, and, looking to the left, a very pretty and cosy effect would impress you.

THE HALL, with its rich red dado of 2in.

could be left out for the present, and dado and base moulds fixed, and the dado filled in with strained canvas. There is a cosy ingle which could be successfully treated with a beam and substantial wood fireplace and old Dutch tiles, the fireplace itself being constructed with an exposed brick arch. The ceiling to have exposed joints as in the hall.

THE KITCHENS are arranged in a handy yet private position with respect to the rest of the house. Instead of providing a scullery and kitchen I have provided a best kitchen and a rough kitchen. The best kitchen could be used as a cheerful breakfast-room as it has a south-east aspect, and in the evening could be used as a servants' sitting-room. The rough kitchen has a cool aspect and has a quarry floor and is provided with a sink and copper. Both kitchens are provided with a range. The back door is so arranged that a view of anyone there is obtained from either kitchen.

THE LARDER is very cool, as it is lighted from north-east and has a quarry floor and quarry settle.

THE COALS can be got under cover from back porch which is paved with 2in. quarries in cement.

THE CHINA PANTRY is provided with sink and quarry floor, and is conveniently situated with regard to dining-room and kitchens.

A CLOAKROOM AND LAVATORY with quarry floor is arranged under the stairs near the front entrance.

THE STUDY has a cheerful aspect and is quietly situated; it is entered off the hall.

communicating with other rooms; but, at the same time, the fireplace end of hall is free from any of this crossing, also being protected from the draught.

The stair and lavatories have been placed in a convenient position for the entrance and the rooms on ground floor.

Thatch has been chosen as the roof covering, seeing that it is cheaper, and gives a more picturesque effect to the elevations; the roofs are kept simple to avoid the necessity of lead valleys, &c.

WALLS.—The walls are rough casted, so that the bricks need not be specially coloured. The number of bedrooms in the conditions is in excess of the accommodation on ground floor, so that in order to provide five good bedrooms and three servants' bedrooms on first floor it has been found necessary to make a covered yard, and build over the coal-place, which is all included in the cubing up. At the same time this yard would be found a convenience in wet weather. Note that the coal-place would only be about 5ft., the wood being stalked in the remaining 4ft.

GARDEN AND APPROACH.—The garden and laying out of the grounds is not included in the £2,000.

NOTE ON ESTIMATE.—The estimate is based at a very low price, being 6d. per cube, so that the details would be carried out in the simplest form. The woodwork would all be deal, and the stonework would only be used for sills, and these would only be 3in. thick. In the cubing the dimensions have been taken from end to end, and every projection with height taken from the bottom of foundations to half-way up the roof. This includes the hall where there is only one floor.

WALLS OVER ONE ANOTHER.—All the walls will be brick, being nearly always built from ground right up to roof.

#### Notes on the Materials to be Used.

DIGGING, ETC.—The ground would be excavated for trenches, drains, etc., also the 6in. of surface of ground would be removed from the site of house to a place directed by the architect.

CONCRETOR.—The concrete for trenches would be composed of one part of Portland cement to seven parts ballast and broken stone or brick as directed.

A similar layer 6in. deep would be placed under all the wood floors.

A layer 6in. thick would be placed under paved or tiled floors.

DRAINAGE.—The drains would be laid to comply with local by-laws, and be tested by water when completed. The drains would be of the best tested stoneware socketted pipes, laid to even and regular falls, with manholes for inspection with cast iron sealed cover. Fresh air inlet and vents taken up to ridge of roof. If the drains are to be connected with a main drain there would be an inspection chamber with special trap, fresh air inlet, &c.

All pipes except w.c. pipes will discharge into open gullies and be trapped off from the main drain.

CONCRETE BED.—Portland cement concrete bed to all soil drains.

DOWN PIPES.—R.W.P. at entrance 3in. C.I. with head in lead; 1in. lead R.W.P. from oriel above dining-room; R.W.P. from end gable to water tank.

EAVES GUTTER.—Half round eaves gutter, with maleable iron brackets fixed to rafters.

#### Brickwork.

The bricks would be hard, well burnt, with a metallic ringing sound when struck. Fair surface or a good colour are unnecessary.

ARCHES.—Rough arches in cement over all openings for doors and windows.

SLEEPERS AND FENDERS.—Half-brick sleeper walls honeycomb and one brick fender walls or ground floor.

BUILT IN CEMENT.—All the piers (small) and half-brick walls.

FLUES.—The flues as shown with withes 1½in. outer 9in.

DAMP COURSE.—D.C. of slates in cement at an approved level.

FAIR FACE AND WHITEN.—The internal walls of w.c. (servants'), scullery, and larder,

wine and beer stores, lamps, are to be fair faced brickwork with struck joints, twice limewhited.

AIR BRICKS.—To ventilate under floors provide and fix 9in. by 3in. terra-cotta air bricks (approved pattern), and form channels through wall for same.

SCULLERY SINK, &c.—A 36in. Twyford's No. 651 B. stoneware sink, white glazed outside and inside, with 2in. lead waste to same, with 3in. brass grating and core piece soldered in.

STOVES.—In all the rooms but dining-room and hall the stoves would be stock pattern. Dining-room and drawing-room would have a simple dog grate. The chimney pieces and tiles would be designed.

PAVING.—All the offices and corridor of servants' part would be paved in tiles in cement.

YARD would be asphalted and laid to fall towards gully.

#### Thatcher.

STRAW.—The roofs to be finished thickness of 9in. with thatching of good hard, stiff rye straw, grown on poor land.

VERGES.—Fair verges, valleys, and hips.

LACING.—Wood lacing for thatched roofing, about 15in., wide securely penned in.

#### Mason and Slate-Mason.

STONE STEPS.—All outside steps except main entrance to be 3in. thick.

STONE WINDOW CILLS.—Will be 6in. by 3in., weathered and throated grooved for weather bar.

SLATE SHELVEING.—Fit up larder with 1in. slate shelves as shown, supported upon half brick bearers—ditto in beer and wine cellar.

#### Carpenter and Joiner.

DISTANCE APART.—No joists should be further apart than 1ft., unless roof rafters which are 18in. apart.

SLEEPERS.—4in. by 3in. deal.

WALL PLATES.—4½in. by 3in.

GROUND FLOOR JOISTS.—Would be 4½in. by 2½in.

FIRST FLOOR.—9in. by 2in. with herring bone strutting.

ROOF.—Rafters' ties 4in. by 2in., and 18in. apart; trusses 4in. by 2in.; Ridge 9in. by 1½in.; Wall Plates 4½in. by 3in.

EAVES.—The ends of rafters carried over walls with 3in. by 2in. tilting fillet running along ends.

GABLES.—Short purlin's projecting 1ft. 6in. with 1½ boarding under and supporting thatch.

FLOORING.—1in. yellow batten flooring, with mitred ends to fireplaces.

SKIRTING.—6in. by 1in. skirting to all rooms.

FRONT DOOR.—Frame, 4½in. by 3½in. Door, 7ft. by 3ft. 6in. by 2½in. double rails and styles, the centre panel of 1½in. material, part of top tube glazed with lead lights.

GARDEN ENTRANCE.—2in. 3-panel door, upper panel with lead lights.

INSIDE DOORS.—Four panelled, moulded. Copper letter plate and electric bell push.

FLOOR FOR BOX-ROOM AND CISTERN.—A floor to be provided in cistern room and box room.

WINDOWS.—Casement windows, posts and head rebated 4½in. by 3in.; sashes 2in.; copper fixings, &c., with scribing mould to brickwork. Parts fixed and parts to open on hinges.

BUTLER'S PANTRY.—To be fitted with shelves and sink and cupboards and all complete.

PICTURE RAIL.—1½in. by ¾in. moulded picture rail in dining-room, study, boudoir.

STAIRCASE AND HALL FINISHING.—The staircase will have 1½ft. treads by 1ft. risers, with 1in. cut strings fixed on the one side, against 2in. moulded panelling between stair and entrance; and other side against 4½in. wall between stair and hall. This wall plastered on both sides, with 7in. by 1in. carved mahogany French polished coping, with fillets under to correspond with fillets forming panelling in wall.

WALL PANELS.—Panelling in hall is made of plaster with grounds fixed to wall at intervals, and fillets 2½in. by ¾in. nailed to grounds, and with coping moulding to panelling 4in. by 3in.

POSTS.—Outside post to porch 10in. by 10in. square.

Post in hall going to ceiling 10in. by 10in. square, and carrying purling 7in. by 6in. with 3in. ribbed pieces.

GALLERY.—Floor joists are carried through with 9in. by 3in. trimmer on face supported by 6in. by 6in. posts. Gallery front 2in. panelling with mahogany top.

WEATHER BOARDING on N.W. elevation is composed of 1½in. boards, the form being 6in. wide, and the back boards 9in. Run vertically, with grooves at each joint to prevent capillary attraction.

CORNICES.—Plain cornice in plaster.

#### Plumber.

CISTERN AND SAFE.—800-gallon stout wrought-iron galvanised rivetted cistern, with stay-bars, overflow, &c.

WATER SERVICE, BATHS, LAVATORY.

HOT-WATER SYSTEM.—Tested cylinder.

GLAZING.—The reception-rooms ½in. best plate glass, the others sheet.

PAINTER AND PAPERHANGER.

#### The Cost.

Cubic contents 79,911 cubic feet, at 6d. per cubic foot = £1,997 15s. 6d.

ERRATA.—In our article in last week's issue the design by "Pippa," mentioned in the list of highly commended designs as the work of Mr. W. L. Dowton, was not by that gentleman alone, but in conjunction with Mr. Alick Horsnell, of Chelmsford. Also the authors of the design under the motto "Christian," in the list of commended designs, are Messrs. R. Wynn Owen and Frank I. M. Owen.

## IN A SAXON VILLAGE.

By F. H. CHEETHAM.

THE little village of Schönfels is situated on either side of the great highroad midway between Zwickau and Reichenbach, in the south-west corner of the kingdom of Saxony. The word "picturesque" best describes our feeling concerning Schönfels. That word, I am aware, may mean anything or nothing. It is vague and indefinite, and is too often used to describe a class of buildings that are totally devoid of any architectural merit and wholly unsatisfactory. Yet such buildings are often pleasing to the eye. And so our Saxon village is picturesque, though there is not a house, or a building of any sort, in it that has any architectural pretension; yet the aspect of the village is eminently pleasing, and at nearly every step we take we are face to face with self-painted pictures which are a source of never-failing delight.

This part of Saxony is thickly populated, and very go-ahead. Busy manufacturing towns are dotted all over the land, yet between these centres of industry the yellow cornfields wave, and the dark pine forests whisper, under a blue and smiling sky. It has a strange beauty of its own, has this undulating Saxon land; a beauty that grows upon you, that impresses itself upon your imagination, and gives birth to a thousand fancies that one cannot see with the natural eye. And it is in the midst of this beauty that Schönfels lies. The houses climb up the hills on each side of the road, which here fringes the margin of a large sheet of water into which the little brook expands in the centre of the village. Crowning the summit of the hill, round whose base the road here winds, stands the old castle, a prominent object in the landscape for many miles around, and seeming to keep a silent but sleepless watch over the little community. Superstition is still rife, and the castle is looked upon with a superstitious awe by many of the villagers, who believe that a dread fate overhangs the old building in consequence of all the evil that has been perpetrated there in times past.

Julian Hawthorne wrote, twenty years ago, that the cottages in German villages were "mostly two-storied boxes smeared with stucco

THE VILLAGE OF SCHÖNFELS, SAXONY.

and gabled with red tiles. They are not real cottages," he continued, "but only small, inconvenient houses. They have a temporary artificial look, conveying the idea that they have been made somewhere else and set down in their present situation quite by accident, to be tried in a new place to-morrow. German toy villages," he concludes, "are more accurate copies of the reality than our years of discretion would have supposed." This description will well serve for our Saxon village. The lack of the home instinct in the people makes the possession of a garden a superfluity, and very few of the houses here possess one. You enter, generally, straight from the road, and the houses are mostly "two-storied boxes smeared with stucco." The walls are strongly built, and the upper storey is usually constructed in timber, and the roof tiled. This "half-timber work" has little of the beauty of that in many of our old country houses in England. It is severely constructional, superfluous uprights being rarely, if ever, used. The spaces are, therefore, wide and either filled in with plaster, or with bricks on edge showing a large face of about eleven inches by five and a half, and of a pink colour. Often, however, the upper part of the house is slated, the slates being hung in a variety of fanciful patterns, and sometimes highly touched up with paint, especially in the gable ends. Or, again, the whole face of the upper storey is boarded with rough boards entirely innocent of the painter's brush. The appearance of this naked boarding is, however, eminently pleasing to the eye, though we cannot help wondering how long such work will last. The older houses in the village all follow this pattern—a pattern to which the term "picturesque" is peculiarly applicable. "A picturesque house," someone has said, "is one which, though meant for use, is practically inconvenient to the verge of uselessness." These houses do seem, to us English at any rate, very inconvenient, though to a Saxon, who wants little else than a place to sleep in, they may be everything that can be desired. The Saxon villager, and not the villager only, but the dweller in the town, knows not modern comforts. He is content to live as his fathers lived, except that perhaps he rides a bicycle, and concerns himself little about sunshine in his house and still less about ventilation. He

will sit in apparent comfort on a July day in a room with closed windows and door, and with a large stove performing its duty in the corner. Everything in his house is dark. Dark wall-papers, painted ceilings, dark and massive furniture, dark heavy window curtains. A certain oppressiveness pervades his dwelling, and we come to attach an altogether new meaning to the dying words of Goethe, "Light, more light!" Light, that is indeed what the Saxon wants in his house. Not that he objects to the light, indeed he lives in the summer months much out of doors, but simply that he has never thought of taking the sunlight into his house. In one house in our village, an English-born housewife has introduced the sun along with certain English ideas into the furnishing and decoration of her rooms. She has got rid of the native oppressiveness, and the natives themselves, though feeling strange at first in such surroundings, acknowledge that rooms so furnished are pleasant to live in.

The more recent houses, however, erected in Schönfels, are built wholly in brick. The brickwork is generally left to be covered at some future time with stucco, but may stand many years before the coat of plaster is applied. In the meanwhile, the appearance of such buildings is far from being pleasant, as the bricks used are of a common quality, roughly set, and with wide open joints. These houses seem to be eternally crying out for someone to come and hide their ill features with a veil of stucco. They are the first sign of the new spirit in Schönfels, but already the village has taken a further step into the nineteenth century, for already there has arisen a modern Renaissance villa in yellow brick and stone, which has quite the appearance of having been imported direct from the nearest town. It is convenient, no doubt; it is roomy and perhaps more healthy than the old square boxes with their red roofs, but it is not picturesque, and we cannot help but regret that it has found its way here. Alas! it is but the forerunner of others, for no new houses will be erected in Schönfels on the old pattern. It will henceforth be honest, nineteenth century building, and the village, as the town, lies doomed in the eyes of the artist. For you cannot but be profoundly conscious that these people have no regard for the past as far as their buildings

are concerned. The new is always admired more than the old, although it may have nothing to recommend it but its newness.

The church at Schönfels is a plain stuccoed structure, with a characteristic German tower. It might not be far from the truth to say that as a building it is positively ugly. It has, at any rate, no pretension to architectural beauty. It is in a shockingly neglected condition within and without, yet, notwithstanding this, or it may be by reason of it, there is something pleasing about the general appearance of the building, which, unlike the two-storied boxes, seems to have a natural connection with the spot on which it stands. Yellow, dirty, and possessing nothing of the beauty of holiness, there is nevertheless a charm of neglected Nature hanging over it, which makes us almost faint hope that the efforts that we hear are being made to build a new house of God will be unsuccessful. It occupies the summit of a gentle hill, down whose southern slope the churchyard falls, and whence a glorious view is obtained over miles of cornland to the great pine forest beyond. There is a strange fascination about this neglected churchyard. As the evening shadows fall the little company of dark cypress trees stand out like so many black sentinels around the old building now growing dark against the western sky. It is a romantic spot which has vividly impressed itself on our memory. But our peaceful evening thoughts are likely to be rudely disturbed when we come in the light of God's sun to look at the house that men have maintained to His honour. We are bound to admit that the people do Him little honour here, at any rate outwardly. Inside the church has an equally neglected appearance. It is filled with stiff backed wooden pews and galleries, all painted, at some distant time, white and gold, but now shockingly dirty. Damp—the place is never heated—and dust are left to do their work. The altar and its precincts call loudly for the free use of the broom and pail, and over all lies a heavy, depressing air in no way calculated to help in the joyfulness of worship. The pulpit is part of the reredos. A large opening high up over the altar is approached by a flight of wooden steps from behind, and from here the pastor addresses his flock. A portrait of Luther adorns the front of the gallery, on

which is carved the date 1730, which was evidently the year that these galleries and pews were put in. When the church itself was erected I was not able to find out. Over the doorway in the tower is the date 1627, with two shields of arms much defaced and the name Margarita von Wissenbach. Close to the churchyard gate is a small square building, bearing the date 1771, which is worthy of notice. It is the burial place of a neighbouring family, and has a gracefully carved slated roof surmounted by two wrought iron finials of pleasing design.

On the hill opposite that on which the church is situated, and rising high above it, is the old castle of Schönfels, which keeps within itself even to this day, we are told, the spirit of the evil that has been wrought there in the days that are gone by. We can picture to ourselves the robber barons descending on the helpless merchants who passed along the road beneath. My imagination will not allow me to ask whether the road then existed; I prefer to believe it did without questioning. You are shown at the base of the round tower the dungeon into which the prisoner was thrown while awaiting the arrival of the ransom that was to set him at liberty; but anything like a true history of this castle I have not been able to discover. To the Saxon the past is a "long time ago." Dates are needless luxuries. Not that with some searching they are not to be found, but when holidaying there is sometimes a certain attractiveness in vague stories that allow full play to our imagination, and permit us to believe just as much as we wish to believe. Under such a spell we cease to seek for "information," and take things as they are. And so I find myself believing all kinds of impossible stories about the old schloss at Schönfels. Without any pretensions to architecture, its patchy yellow stuccoed walls and red roofs give the castle a picturesque appearance, harmonising very completely with its surroundings. It seems to have grown out of the hill top, and to be as closely rooted there as are the trees that surround it. For miles around it can be seen overtopping the waving cornlands, and from far it seems always to be welcoming us back once more to the village; for in spite of its evil name, we cannot help but entertain a kindly feeling towards the old castle. What would Schönfels be without it? A climb up its round tower, which rises straight from the round in the inner grass-grown court, reveals

THE CHURCH, SCHÖNFELS.

a wonderful panorama of the country round. The rooms are deserted and bare except for dust and a few old pieces of furniture, which for some reason have not been taken away. The chapel presents a melancholy appearance of neglect. It is very small, but contains a wooden gallery, the front of which is decorated with grotesquely crude paintings. An elaborately carved pulpit strikes one with its hideousness of design and colour. Dust is over all. The castle has belonged since 1750 to the Von Römer family. At present they reside at Steinpleis, near Werdau. Before this date it belonged to the Von Deskau family. A book in the chapel bears the name of Adelaide von Deskau.

Picturesque! Yes, there is no other word to describe it; the old castle is picturesque, whether viewed from within the grass-grown court with its wooden galleries, or from afar over the yellow fields. And not least picturesque is the old forester who makes his home here, and to whose kindness we owe the privilege of seeing the interior.

It is not yet the nineteenth century at Schönfels, and it is sometimes hard to realize that you are here in the immediate vicinity of many big and growing manufacturing towns—Werdau, Zwickau, Reichenbach, Neumark, Mylau, Netzschkau. Yet Schönfels itself is as romantic and beautiful a village as one could desire. But a change seems bound to come sooner or later. Everywhere the new Germany is fast pushing out the old, and closed in between so many great centres of industry, the aspect of the country is bound to undergo a change. I suppose it is inevitable, yet from an artist's point of view it is regrettable. In all the towns round about the old picturesque buildings are disappearing to make way for modern Renaissance structures, possibly more healthy and convenient, but far less interesting. In themselves many of these new buildings, at any rate in the towns, are not unpleasing, but their presence will not compensate us for what we have lost. In Zwickau, in Reichenbach, in Mylau, in Plauen, the old buildings are fast disappearing. Soon all will be painfully new. But the change is more to be lamented in the country than in the towns. Things seem to be going ahead in this part of Saxony, and it may be safely predicted that Schönfels will grow in size, and with its growth will lose much of the delightful old-world appearance that is its to-day.

**Royal Exchange Decorations.**—The latest addition to the Gallery of Historic Panels in the South Ambulatory of the Royal Exchange was unveiled last week. The panel represents Queen Elizabeth being received by the then Lord Mayor, Sir Thomas Gresham, at the opening of the first Royal Exchange. It is the work of Mr. Ernest Crofts, R.A., and shows the Queen seated on a white charger, the details of the picture being excellently worked out, even to the study of an attendant strewing herbs in her Majesty's path. Mr. G. Greville H. Palmer presented the fresco to the Gresham Committee, on behalf of the Mercers' Company.

## REGISTRATION OF ARCHITECTS.

## DISCUSSION AT SHEFFIELD.

A MEETING was held on Friday, June 30th, at the Cutler's Hall, Sheffield, to consider the question of the "Statutory Registration of the Profession." The subject was introduced by Mr. Ellis Marsland, whose paper was fully reported in our last week's issue. In opening the proceedings, the chairman, Mr. T. Walter L. Emden, president of the Society of Architects, said that he and his colleagues were there, not in any way in opposition to other societies, nor with any desire to place themselves in the fore front of the battle which necessarily must be fought some day, in regard to the question of the registration of architects. He was very anxious that the Royal Institute of British Architects should take the matter up. They had several times passed resolutions on the subject, but so far they had done nothing more, and there were not a few members of the profession who felt that the time for passing pious resolutions had gone. The doctors, the surgeons, the dentists, the lawyers, almost everybody connected with a profession had the rule of compulsory examination in force, and it seemed absurd that the men who had so much control over the pockets and the health of the public should be placed in such a position that anyone could enter their profession. Anyone could to-morrow place a brass plate over his door announcing himself as architect and surveyor without any special education at all—the oilman, the coal merchant, or anyone could do this. He mentioned the oilman and coalman because they had instances of these two doing something of that kind. To his mind the necessity for registration must be apparent to everybody, and all they wanted was that the subject should be pressed forward and the profession placed on a better footing as early as possible. It was no use saying that they had an examination twice each year, because the examination was not compulsory, and did nothing to protect those in the profession. The whole thing lay in a nutshell. Was it or was it not necessary that those who wished to be members of the oldest profession in the world should have a compulsory examination before they could start in practice? He thought every sensible man would say it was necessary, and would also say that there should be a system of registration. There was such a system in every other civilised country in the world, and it seemed to him that England—the first country in the world—was very much behind hand in this matter.

Mr. Ellis Marsland, hon. secretary of the Society, then read his paper on "The Statutory Registration of the Profession," after which Mr. F. Vallance moved "That this meeting cordially approves the principle of the statutory examination and registration of architects, and is of opinion that it is desirable in the interest of the public and the architectural profession to promote a Bill in Parliament for the attainment of this object." He remarked that it was quite true as the chairman had said that almost anyone—a builder's foreman, a clerk of the works, or any other person could put up a brass plate and practice as an architect. They wanted to put an end to this, and to stop it they were proposing a Bill for the Registration of Architects. It was all very well for leading members of the profession, men at the top of the tree, to be indifferent on the matter, but he thought it was the business of all connected with the profession, including those at the head of the profession, to do what they could to improve the profession, and to protect those who were coming into the profession from the evils which they were suffering from to-day. It was also important that the public should be protected from these unqualified practitioners because it was necessary that their buildings, both domestic and public, should be artistic and healthy, and carried out on the most scientific principles. The position taken up by the Royal Institute up to the present time was against Registration. He knew the view held by some members of the

Royal Institute was that shortly the letters F.R.I.B.A. or A.R.I.B.A. would be looked upon by the general public in the same way as the letters M.R.C.P. or M.R.C.S. or L.R.C.P. are looked upon in the medical profession. But he could not go that length. He could understand this position being taken up if the examination were compulsory, and if no one could practice who had not passed the examination. But without such a compulsory examination how could the hopes of those members be realised when they knew full well that there were hundreds of men practising as architects, and who would continue to practise, who could never hope to get admission to the Institute. If they obtained a Bill this condition of affairs could and would be altered in the future, and their profession would be raised to a higher standard; to the level of the medical and legal professions.

Mr. J. R. Wigfull having seconded the resolution, Mr. A. F. Watson complained of the short notice given of that meeting, and expressed the belief that there would have been a much larger attendance if longer notice had been given.

The Chairman regretted that Mr. Watson thought the notice too short. The subject had, however, been before architects generally since 1881, and the profession, therefore, had had plenty of opportunity for considering it. In Leeds, last year, the same notice was given, and not only had they a large attendance, but the resolution in favour of registration was carried unanimously.

Mr. Bryden said he had been in practice in the provinces for twenty-five years, and no one had been punished more than he had for want of registration. The resolution had his cordial support, and he would do all he could to help forward the proposal to get the matter through Parliament.

Mr. Fenton said although the time had been too short to call the members of the Sheffield Society together, he believed the majority of Sheffield architects were strongly in favour of registration in some form or other, without committing them to any particular details. Of course, they were affiliated to the Royal Institute, and many of their members were members of the Royal Institute, and therefore they would not desire to go in opposition to the Institute. At the same time, he felt that if the Institute would take the matter up it would be a good thing for the profession generally.

Mr. J. Smith thought Mr. Fenton had voiced the general opinion of the members of the Sheffield Society of Architects and Surveyors, so far as that opinion had been expressed in reference to statutory examination and the registration of architects. But he was afraid, if the resolution were put to the members of the Sheffield Society in its present form, there would not be an unanimous vote upon it. He did not think the members generally would support the latter part of the resolution—that part committing them to a Bill. While he should be sorry to discourage that Society or any body of architects from seeking to realise in any wise and practicable way their wishes in regard to registration, he did not personally think that the promotion of a Bill at this juncture would be a wise thing. There were a great many of the leaders of the profession that were not with them in this proposal, and to say the least of it the Royal Institute was rather apathetic on the subject. To attempt to promote a Bill with this state of feeling in the profession he contended would be unwise; the Bill would be doomed to failure, and, moreover, the Legislature would most likely be prejudiced against any Bill which might be submitted in the future when a greater proportion of the members of the profession were converted to the idea. He suggested an alteration of the resolution approving of the principle of statutory examination and registration, and expressing their view in favour of every wise and practicable effort being made to realise their opinion.

Mr. G. S. Haslam approved of the resolution as a whole. He gathered from the opinions expressed by some of their friends present that if the great Institute were to express its willingness to go in for the Bill they

would follow their lead like a flock of sheep. While he could not say that he agreed with every detail of the Bill that was suggested for presentation to Parliament, he could foresee that no Bill would suit everybody, and they must take the Bill that would be most acceptable to the profession generally.

Mr. J. B. Mitchell Withers thought several matters wanted more fully explaining before they should be asked to vote for the Bill referred to. He should like to know what kind of examination articulated pupils would be expected to pass.

The President appreciated the fact that it was not wise to rush forward too impetuously for legislation, but this matter had been before the architects of the kingdom in the shape of a Bill for something like twelve years, and it did seem to him that that was a reasonable time. He wished to make it clear that the Society of Architects did not want them to pledge themselves to this particular Bill. It was not the Bill of the Society, and it would most probably require amendment; but they wanted an expression of opinion in favour of legislation on the subject. There was, he believed, the oldest profession on earth, and it was necessary that they should have this examination to protect themselves, and that they should have registration in order that the public might know who had the right to practice in the profession. The examination that the Institute now had did not prevent and never could prevent men coming into the profession who had no right to be in it. A few figures, he thought, would show the necessity for legislation on the subject. The Royal Institute had a membership of something like 1660, and the Society of Architects something like 600. In the profession were between 20,000 and 25,000 men practising. How many of these had no right to practise at all, and how many had little or no knowledge of the business? They were told that the time was not opportune. For thirty years the medical profession tried to pass their Bill. It was not the large societies that eventually got the Bill passed; it was not the leading men. They opposed it, and yet all admitted to-day that it was of the greatest advantage to the medical profession.

Mr. Buck thought the first thing to be done should be to win over the Royal Institute.

Mr. Vallance, in reply to the Chairman, said he preferred to have the resolution stand as it did rather than alter it as suggested by Mr. Smith.

Mr. Smith then moved to omit the words of the resolution after the word "architects," and to substitute, "and is in favour of every wise and practicable effort being made to realise this registration." He was strongly of opinion that there must be far more unanimity on the subject of legislation in the profession before there would be any chance of a Bill becoming law.

Mr. Mitchell Withers seconded the amendment, and Mr. A. F. Watson supported.

The President said that out of something like forty letters of apology he had received thirty-three spoke absolutely in favour of the resolution. Mr. Gibbs wrote: "In respect to statutory registration, my views are somewhat modified from what they were in the year 1886, and I am disposed to support the policy of the R.I.B.A. on the subject." That was all very well, but up to the present the R.I.B.A. had done nothing but pass resolutions.

Mr. Marsland Ellis, replying on the discussion, contended that the time for passing resolutions had gone by and the time for action had arrived. As the Chairman had already said, the Society of Architects were not pledged to the Bill now before them, but they said that there must be legislation in some form or other.

The President then put the amendment to the meeting, and it was supported by four gentlemen, fifteen voting against. On the resolution being put it was carried by seven votes to three against.

[We shall publish next week the opinions on this subject of a number of leading architects, specially contributed to the BUILDERS' JOURNAL and ARCHITECTURAL RECORD.]

# LEAMINGTON FREE LIBRARY AND TECHNICAL SCHOOL.

## NOTES ON THE COMPETITION.

BY OUR SPECIAL COMMISSIONER.

YET another unsatisfactory competition must be recorded, for, in spite of the Town Council of Leamington employing the most experienced specialist they could find (Mr. E. R. Robson, F.S.A., architect to the Education Department), inviting a selected list of architects, and having careful instructions drawn up, they have yet, in their wisdom, thrown over the assessor's and their own Building Committee's reports, and chosen a design which a local paper characterises as a "rank outsider."

The proposed site for this building is an admirable one, though somewhat awkward in shape; it is two or three minutes' walk from the heart of the town, adjoining the Manor House Hotel and Pump Room Gardens.

Briefly, the instructions required a Science and Art School and Library, the whole as a public building to form one well-massed group. The fund for the completion of the building exclusive of fittings, was stated to be about £12,000, and competitors were therefore

been the subject of much adverse criticism, and "rough-cast" is no doubt an unusual material for a public building in England. In a clean town like Leamington, surrounded as the building would be by masses of umbrageous foliage, we think a white or cream-coloured building would look very charming, relieved as it is by a red brick base and dressings, a deep cornice, and red Italian tiled roof. Interest is concentrated on the central feature, a stone dome, with octagonal drum and seated figures on the angles. The entrance to the Free Library is treated with attached rusticated columns, and pediment, and the elevation shows some well drawn sculpture and ornament. The perspective, however, is not so happy, as it lacks vigour and definition, and by no means conveys the ultimate colour effect. The plans may be grouped under two heads, those arranged in a rectangular form, and those following the frontage lines of the site, taking the shape of an obtuse-angled L. Thumb-nail sketches of the ground and first floor plans of the rival designs are reproduced, and will enable our readers to judge their merits for themselves. With reference to plan A, we may add that the physical laboratory is placed in the basement (to be free from vibration), as are also the carpenters' shop with wood store, and, approached by a separate stair case, the cookery and laundry, coals, heating, &c. On the second floor is the caretaker's suite of rooms, connected with an entrance in the basement by a separate stair.

As regards plan H, the assessor, no doubt wisely, considered that the general scheme was unsuitable for an open site, as well as being far more costly than the Council stipulated for. The defects that mar the library are many, and cannot be overcome without entirely altering the plan; for instance the reference library is 600ft. super. larger than required. It is in a central position, with a sloping ceiling 10ft. 6in. high to the wall plate, a quite inadequate height for so large a room, and unfortunately this cannot be raised without destroying the light and ventilation of the surrounding rooms. The librarian's and committee rooms are badly placed, and neither adjoins the reference library, nor the safe room for valuable books, as it should do. The Technical School rooms appear to be well arranged on the first-floor plan, but there are some important defects that no doubt influenced the assessor in his decision. For instance, it is not advisable to light the antique and modelling rooms with windows towards the east and skylights on the north; vertical, as well as inclined, lights are essential in a studio.

As a matter of organisation, we much prefer one central entrance with a porter's box to supervise the hall. This is done in plan A, and enables the porter or caretaker to be easily accessible to answer inquiries;—such a man frequently supplies drawing materials and stationery, a great convenience to the students. Plan H, with the separate entrances on east and west for "boys" and "girls," precluded the possibility of this supervision;—the girls moreover have to walk the whole length of the corridor (140ft.) to gain the secretary's inquiry office. The basement provides for carpenter's shop, heating and coals, as well as caretaker's living rooms and unpacking room. The elevations are well drawn and treated in a free Renaissance manner in brick and stone, the lecture hall on the front elevation being covered with a hipped roof at a higher level. A gable is carried up as a central feature with flanking semi-circular stone gables, the tympani of which are filled with carving. These gables are repeated on the four elevations. The east and west angles of the north elevation terminate in low octagonal turrets in the upper part of which are arranged the lavatories and w.c.'s for boys and girls. The cubic contents appear to be somewhat under-estimated and the author refrains from giving an estimate. The Council appear to imagine that such a building could be erected for 6d. per foot, but from actual recent experience we are convinced that at least 9d. per foot cube must be allowed, making a total of £18,000 odd.

Plan C also takes the form of a hollow cube

on the first floor, and is the most compact and economical of all the schemes. The library is on the western side of the square, with entrance on the south, whilst part of the Technical School is placed on the eastern side, with entrance and staircase in centre. On the first floor the art rooms are all towards the north, the lecture room is near the staircase, and the Technical and Science Schools are well laid out. The preparation room appears too small, and one stair but 5ft. wide is surely insufficient for all the students that might assemble on this floor. The elevations are very simply and pleasingly treated, on the ground floor in brick, and above in "rough cast," relieved with flat brick pilasters and gables. The whole external character is, however, too domestic in feeling.

Plan D is somewhat similar to A in outline, but with the library entrance on the angle and the library on the west, away from the town. The reading and magazine rooms, lending library, and youths' room are on the ground floor, and reference library, book store and librarian on first floor. The Science School is on the ground floor and the Art School above, while the caretaker is centrally placed on the second floor. The woodwork shop, cookery, and laundry are in the basement, and a noticeable defect is that these two rooms are approached by the same staircase. The elevations are broadly treated in brick and stone in the Georgian manner and illustrated by a

GROUND FL. PLAN

FIRST FL. PLAN

PLAN "A."

beautiful set of drawings and boldly washed perspectives. The ground floor windows, though charming in elevation, are too small for the large rooms they light.

The authorship of plan E is very evident from the delightfully drawn elevations. The block plan is square, but without any central well, and consists of ground, first, and second floors. The carpenters' shop on the ground floor appears ill lit and badly placed next the physical laboratory in spite of the hollow wall between them. The approach to the lending library is not as direct as it should be, and the plan generally lacks simplicity. The reference library is on the first floor. The class-rooms are somewhat scattered, and not arranged in pairs as required, but the external treatment is unquestionably the best and most original of all the designs sent in, and we hope to see the charming pencil perspectives in next year's Academy.

Plan B strikes one as covering a large area. It follows the lines of the site and consists of two floors only. The entrance to the schools is on the angle and that to the library is also similarly placed to Plan A. The librarian's room is admirably situated for purposes of supervision, but was perhaps considered too public. The cloak-rooms seem unnecessarily large, and though the Art and Science Schools would be thoroughly workable, the great length of

required to plan in the most compact and economical manner possible. In the words of the assessor, "the exterior should indicate the internal uses rather by good proportion, good outlines and suitable character, than by ornament or decoration." A schedule of accommodation was appended with the required area of the rooms, so that all appeared perfectly straightforward, the only difficulties being the small amount allowed and the irregular shape of the site. Nine sets of plans were submitted, and Mr. Robson placed them as follows, the Building Committee unanimously endorsing his recommendation:—(1) Plan A., Mr. J. E. Newberry, 47, Victoria Street, Westminster; (2) Plan C. Messrs. F. H. Greenaway and J. A. Smith, 21, Queen Anne's Gate, Westminster; honourably mentioning Plan D, Messrs. Brewell and Baily, Nottingham, and Plan E, Messrs. Malloes and Grocock, Bedford. Notwithstanding this weight of expert opinion, the Town Council, by a majority of nearly two to one, negated the report and placed Plan H first, by Mr. J. Mitchell Bottomley, of Middlesborough and Leeds. Plan A was changed to second place, and C, D, and E were honourably mentioned.

We have had the opportunity of examining the designs and emphatically uphold Mr. Robson's award. Plan A has undoubtedly the best library, a thoroughly well-planned Art School entirely lit from the north and an economical and workable Technical School. The external treatment of this design has

corridors is decidedly extravagant. The elevations are interesting and original and the perspectives boldly drawn in ink.

Plan I is square in form and somewhat similar to Plan H, though with a far better library. Six class-rooms are similarly arranged on the ground floor and the remainder of the school is placed upstairs. Externally, the building is treated in brick and stone, with a tower over the central entrance.

Plan F is somewhat elaborate externally, with flanking turrets to the central library entrance. The block plan is rectangular, though somewhat ragged in outline. The basement consists of the Technical and Science Schools, with the library on the ground floor, and the Art School and three class-rooms above.

The remaining plan, G, is weak and puerile, illustrated by perspectives that give one the impression of an enormous building. The back view might be a block of flats with its range of six stories one above the other!

To sum up, it appears to us that the Council have not only made a serious mistake in overriding the assessor's award, but have also acted most unfairly to the profession. They should have accepted the design recommended by Mr. Robson, than whom no one has more experience or is better able to judge school planning. If modifications were required, it is to be assumed that the author could have satisfied the Council. Failing this course the very least the Council can do is to award the first and second premiums as Mr. Robson advises, and then, if they must, let them give the work to whomsoever they will.

## THE LATE MR. BANISTER FLETCHER.

BY the death of Mr. Banister Fletcher, F.R.I.B.A., which occurred last Wednesday, the profession of Architecture has sustained a severe loss. Not only by reason of the works he has carried out, but by the books he has written, and the instruction he has given to successive generations of young architects, he has exercised an influence scarcely equalled by any architect of this generation. Born in 1833, Mr. Banister Fletcher was educated privately, and commenced practice as an architect and surveyor when he was only twenty years old. During his lengthy professional career he has erected chapels, schools, factories, warehouses, and almost innumerable suburban villas. One of his latest buildings was the new King's College at Wimbledon, which was opened last Thursday, and is illustrated on page 348. He also had an extensive practice as a consulting architect and surveyor, and his services were often in request as arbitrator and umpire.

But it is as *Professor Banister Fletcher* that he will be most generally remembered, and it is beyond doubt that in this capacity some of the best work of his life was done. In 1890 he was elected Professor of Architecture and Building Construction at King's College, but he had for some time previously been an occasional lecturer at that Institution. He has also for some years past been one of the lecturers appointed by the Carpenter's Company to deliver the lectures annually given in the Carpenter's Hall on matters connected with the building trades. Mr. Fletcher has published a number of text-books, some of which have gone through several editions, and are regarded as standard works on the subjects with which they deal; his works include "Dilapidations," "Light and Air," "Valuations and Compensations," "Arbitrations," and a handbook to the London Building Act, 1894; he has also written, in conjunction with his son, Mr. Banister F. Fletcher, an important work on the "History of Architecture."

Mr. Fletcher became an Associate of the Royal Institute of British Architects in 1860 and a Fellow in 1876. He was also a member of the Architectural Association and of the Society of Architects. In spite of the heavy

demands upon his time and energy which his professional position involved, Mr. Fletcher found time to act as chairman of the Trades Training School Committee of the Carpenters' Company, as a member of the City of London Corporation, and as Colonel of the Tower Hamlets Volunteer Rifles. He also sat in the Parliament of 1895 as Liberal member for the Chippenham Division of Wiltshire.

As an architect, Professor Fletcher might have been described as "an all-round man;" he united, as few men have done, a high degree of artistic taste with unrivalled technical skill. Nor was his knowledge merely theoretical; he could himself, it is said, rival the most skilled artisan in building a brick wall, wiping a plumber's joint, or dressing a door. This combination of practical, business-like qualities, with a touch of idealism and artistic sentiment, fitted him in a singular degree for the position he held with so much credit and usefulness of guide and adviser to the rising generation of architects and surveyors.

A hard worker all his life, Professor Fletcher died in harness; on the day before his death

THE LATE PROFESSOR BANISTER FLETCHER.

he was sketching out in his bedroom the plans for a large building about to be erected. The funeral service was held on Monday at St. Mary's Church, Kilburn, and the interment took place at the Hampstead Cemetery.

**The Antiquities from St. Michael, Bassishaw,** found during the excavations, will be added to the Guildhall Museum.

**Architectural Society's Dinner.**—The annual dinner of the Lincolnshire and Notts Architectural and Archaeological Society was held last Thursday.

**Dundee Institute of Architecture Competitions.**—The competitions of the Dundee Institute of Architecture for 1899-1900, particulars of which we gave in our issue for June 14, are limited to residents in Dundee and the neighbourhood.

**The Tudor Hotel,** situated near the Princess's Theatre, Oxford Street, W., was opened last week. The entrance hall is utilised as a lounge, with rich lined marble walls and pillars, old carved oak appointments, and luxuriously-upholstered easy chair, settees, &c., while on the upper floors are range after range of handsomely furnished bed-rooms, all representing the highest degree of modern comfort. The dining-room is designed with a rich, warm scheme of colour and decoration and contains substantial furniture. The drawing and reception rooms are also furnished and embellished in a refined manner. Empire mirrors, old French ormolu clocks, candelabra, and other elegant furniture in the antique style, and luxurious carpets make the rooms as cheerful as they are cosy. Altogether there are some 200 rooms in the hotel.

## Correspondence.

### CEMENT COVERING FOR BRICK WALLS.

To the Editor of THE BUILDERS' JOURNAL.

MANSFIELD.

DEAR SIR.—I am greatly interested in your valuable journal, and find in it a vast fund of practical and useful information. Your answers to enquiries are, as a rule, up-to-date, but I must take exception to one which appears in a reply on cement covering for brick walls in your issue dated June 14th. I don't think H. E. can be a practical plasterer or he would not use terms such as "compo," "sand," "lightly scored," which are unknown in the trade; moreover, the reply to J. M. S., and many more readers of your valuable journal, is very misleading. In the first instance he advises rough rendered about  $\frac{3}{4}$  in. thick. This thickness, I might mention, is an average one, specified by most architects for three-coat work when finished. Then, again, the proportion of H. E.'s "compo" gauged four or five to one is most absurd, as cement or sand gauged this strength is no stronger than well burnt lime, mixed with a correct proportion of sand, and its damp-resisting qualities are practically nil. Finally, a trowelled face resists damp better than a floated face, the latter one being recommended by H. E.—Thanking you in anticipation,

ANGLICE.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

CLAPHAM.

SIR,—Mr. Middleton, in your issue of June 28th, makes reply to my suggestions, but very unsatisfactory to my mind. He first contends that because the members of the R.I.B.A. have already to pay a fee and are registered as it were in their list they should be exempt from another payment. But the R.I.B.A. is an ordinary society and should claim no more favour than the Society of Architects; its members pay their fee not for registration, but for their diploma and the social standing it confers. Then with reference to examinations, he says, "training is more essential than cram." Certainly, but I would ask: Would those apprenticed to architects who would be registered under the Bill obtain that training? I think not, for Mr. Middleton surely knows the way in which apprentices to architects are often allowed to go without any instruction from their chief, and some would even be incapable of giving it. So there is not always advantage in apprenticeship. A candidate should not be forced to pay a fee probably for no advantage; besides, a man may gain just as good training under a builder as he could under an architect; I do not mean on the artistic, but on the practical side of his profession, for there should be no attempt to examine a man in Art, except so far as a general knowledge of the history of art, and a slight knowledge of archaeology. Mr. Middleton says: "Architects certainly ought to be able to manage their own business." They ought, but he must never forget that architects have the supervision of and interference with other people's businesses, and the other people would wish to have some means of seeing that the architects are capable. For this reason I suggested the additions to the Council, for by the Bill architects would gain much in power over the pockets and work of others. With regard to the keeping of the register, I still contend that the arrangement of names under towns should be embodied in the register, for the Bill goes into the question of keeping it alphabetically, and it would be just as well to embody my proposal also. I had not forgotten, as Mr. Butler suggested, that matters of this kind were dealt with in committee, but I made the suggestions with the idea that the framers of the Bill might see fit to introduce amendments in committee on some of these matters.—Yours, &c., H. D.

## Under Discussion.

### DEFECTS IN PLUMBING.

A meeting of the People's Palace Architectural Society, was held on Saturday, June 11th, Mr. Albert Grenville in the chair. An interesting paper was read by Mr. S. Rosenheim, entitled, "Some Defects in Plumbing and House Drainage." The author, in his opening remarks, said that when drains were laid on concrete, with interceptor, soil pipe outside, and ventilated, under the supervision of a sanitary inspector, the drainage is considered perfect, but this is not always the case, as sometimes serious defects occur in the detail. He then explained how joints should be made and protected, illustrating his remarks with lantern slides. He then passed on to the sizes of pipes, explaining that a small pipe gave a better flow and had a more cleansing effect than larger ones, showing some interesting slides illustrating how pipes had become silted, or clogged, by not having had a sufficient force of water running through them. Ventilators received considerable attention, the author explaining some defects, and showing several slides of bad cases. With regard to bath and sink wastes he said that it was sometimes the idea with people that because the pipes from wastes are not in direct communication with the drain they would not require trapping, but were they to see the inside of the pipes caused by the soapy water and the like, they would soon change their opinions. Scullery sinks are the cause of a great deal of trouble unless they are properly fitted. Greasy water is often run down them, and when it reaches the old water in the trap the grease is congealed and in time will clog the drain. A remedy for this is to have a grease trap fitted over theully which can be removed and cleaned periodically. At the conclusion a brisk discussion ensued, and some practical questions were answered by the author. A hearty vote of thanks was accorded Mr. Rosenheim for his able paper.

### LINCOLNSHIRE ANTIQUITIES.

The annual assembly of the Architectural and Archaeological Society of Lincoln and Notts after a lapse of thirty years, being again held Gainsborough. The first excursion took place at Wednesday, the route lying altogether in Lincolnshire. The churches to which chief attention was paid were those at Blyton, Wighton, Scotter, Scotton, Northorpe, Kirtton, Waddingham, Blyborough and Corringham. Luncheon was taken at Kirtton Lindsey, and at Gainsborough, after which the members paid a visit to the Parish Church. In the evening the annual dinner of the Society was held, and was followed by a public meeting in the Marshall Memorial Institute, when the Rev. Mr. Cave, Vicar of Blyborough, read a paper on "The Romans in Lincolnshire." He said that Lindum Colonia (Lincoln) was founded in 70 A.D., on the same site as a pre-existent British village. From Lincoln came one of the three British bishops who attended the Council of Arles in 313 A.D., which brought them face to face with the question of the introduction of Christianity into Britain. The Newport gate in Lincoln was a wonderful fragment of architecture left by men who seemed to have built for eternity, and from Lincoln ran the great Roman road, Ermine Street, straight as an arrow's flight, for forty miles to its destination at Winteringham, the ferry across the Humber. Referring to the mental attainments of the Romans he would present pre-eminence in science, with regard to the fine arts we had only to take a modern florin or shilling, and compare it with a Greek or Roman coin, to see that we had small claim to artistic ability in respect. When Macaulay's New Zealandeller came to stand on a broken arch of old Bridge to sketch the ruins of St. Peter's, that traveller might well exclaim that nineteenth century Englishmen were, in any rate, but a puny race after all.

Mr. Cave here passed round two bronze coins, one Roman, the other present-day English, in which he pointed out the vast artistic superiority of the Britannia on the older coin.—The Rev. Canon Moor, vicar of Gainsborough, followed with a paper dealing with the progress of Christianity after the departure of the Romans. The county of Lincoln was rich in pre-Norman ecclesiastical remains, and, as was natural in such an exposed county, in pre-Conquest towers. These Romanesque church towers were largely intended as strongholds against marauders. Without a sense of increased security the solidity of the Anglo-Saxon and Norman styles would never have yielded so completely to the grace and lightness of those that followed. He agreed that there was a close connection between the square towers of Lincolnshire and the round towers of Ireland—in purpose and in the time of erection. The different shape was, doubtless, due to local reasons, and the abundance or lack of large stones for angular mason work. At the latest he would assign the towers at Barton, and perhaps Broughton, to the time of Edward the Confessor.

## Keystones.

**Horndon-on-the-Hill Church, Essex,** a quaint, picturesque building of the thirteenth century, is to be restored, provided funds are forthcoming.

**Workhouse Extension at Yarmouth** was the subject of a Local Government Inquiry recently. The extension needed is the erection of a new laundry.

**Mr. E. Jenkin Williams, M.S.A.,** Architect and Surveyor, has removed his offices from 14, High Street, to the new premises recently erected at 31 and 32, High Street, Cardiff.

**New Sunday Schools at Barrow** are being erected in the parish of St. John, in place of the old buildings. The buildings are being erected by Mr. Brown, builder, and are estimated to cost £1,500.

**The Practice of the late Mr. George Fleetwood, Surveyor,** of 3, New Court, Carey Street, Lincoln's Inn, will be continued at the same address by his son, Mr. George S. Fleetwood, in conjunction with Mr. W. Eversden, under the name of Fleetwood, Son, and Eversden.

**Proposed Statue to St. Bernard.**—It is proposed to erect a statue to St. Bernard de Menthon near the institutions which he founded at the passes of the Alps in the tenth century, for the benefit of pilgrims journeying to Rome. The keepers of the hospices are Augustinian Monks, whose primary work is to rescue, with the aid of large dogs, travellers who are in danger of perishing from snow and cold. The places, which can afford shelter to about 300 persons, are visited every year by many British tourists, who are gratuitously entertained, and to these, especially, an appeal for funds is made. Those desiring to contribute are requested to send their donations, however small, to the Superior, Hospice of the Great St. Bernard, Canton of Valais, Switzerland.

**Pictures for Government Offices.**—The Cabinet Room at the Foreign Office has just been enriched by two interesting historical paintings—one of Spencer Perceval, by G. F. Joseph, A.R.A., and the other of the Earl of Bath, which is attributed to Sir Joshua Reynolds. The Cabinet Room adjoins the beautiful reception-room in which were hung not long since the full-length oil paintings of William IV. and Queen Adelaide, which were unearthed in an old curiosity shop in London by Viscount Esher, the Secretary to the Office of Works. There have also been placed in the official residence of the Chancellor of the Exchequer in Downing Street four interesting portraits—Sir Francis Burdett, by T. Phillips, R.A., William Windham, by Sir T. Lawrence, R.A., Richard Cobden, by Fagnani, and Henry Pelham, by W. Hoare, R.A.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### CABMEN'S SHELTERS.

To the Editor of THE BUILDERS' JOURNAL.

CARDIFF.

DEAR SIR,—Could you let me know where I may obtain designs for "Cabmen's Shelters."—Yours faithfully,

W. B. E.

Appended is a sketch plan and elevation of the exceedingly picturesque "Shelter" at the

CABMEN'S SHELTER IN NORTHUMBERLAND AVENUE, S.W.

junction of Northumberland Avenue and the Thames Embankment. All others about London are similar. G. A. T. M.

### TYPEWRITERS FOR SURVEYORS.

To the Editor of THE BUILDERS' JOURNAL.

DUNDEE.

SIR,—Can any of your readers state from experience the best make of typewriter for use in a surveyor's office for typing schedules of quantities, and duplicating to, say, ten copies? EXPEDITION.

If any of our readers who use a typewriter for this work care to relate their experience for the benefit of our correspondent, we shall be pleased to publish it. Our idea is that any of the standard machines where the writing is visible would be suitable for such work; the "Bar-lock," we believe, has a special arrangement for tabular work.

### BOOKS FOR BUILDING CONSTRUCTION STUDENTS.

To the Editor of THE BUILDERS' JOURNAL.

PRESTON.

DEAR SIR,—I intend to go in for the Honours stage of the Science and Art Examination in building construction next year.

Will you kindly tell me through your valuable journal which book or books you consider are the best for my purpose. Kindly name price and publisher and oblige.—Yours truly,

X.

"Building Construction," vol. III. (Longmans), 21s.; "Specification" (Talbot Newspaper Company), 5s.; Middleton's "Stresses and Thrusts" (Batsford); Hamlin's "History of Architecture" (published in America, but can be obtained from B. T. Batsford, 94, High Holborn, W.C.), 9s.; Seddon's "Builder's Work" (Longmans), 16s. G. A. T. M.

## Bricks and Mortar.

July 12th, 1899.

"I know what it is to live in a cottage with a leak floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### The Parks Committee Dissatisfied.

It will be remembered that the London County Council decided to retain on the new recreation ground at Bromley-by-Bow the old Tudor house, familiarly known as Rutty's house. The Parks Committee are evidently not in favour of this decision, as they intend to make a further effort to effect its removal. They say that having again visited the building they are still of opinion that it should be removed. They think that any member of the Council who inspected the house would find it impossible to vote for its preservation. The area of land, including the site of the house, is less than  $1\frac{1}{2}$  acres, and they consider it undesirable that such a small space in a thickly crowded district should be restricted by allowing any house to remain upon it. The house is in such a dilapidated state, they say, that to restore it would practically mean rebuilding it, and most of its historic interest would be lost. If the building is retained for the purpose of being used as a public library such structural alterations will have to be made that few, if any, of the interior fittings will remain. In these circumstances it seems that the best thing to do is to follow their advice, as if restoring the house practically means rebuilding, very much of the sentimental interest in it will be destroyed as completely as if it was demolished.

### The Trust and Increased Cost.

At the recent meeting of the National Trust for Places of Historic Interest, the Bishop of London drew attention to a case in which the interposition of the Trust had led to increased cost in the restoration of a church. It appears that St. Mary, Stratford-le-Bow, a church dating from the fourteenth century, and one of the few old buildings of real architectural merit in East London, had fallen into a very bad state of repair, and a new rector found opportunity to affect a much needed improvement. Plans for its restoration were prepared, but they did not meet with the approval of the Trust or the Society for the Protection of Ancient Buildings. The Bishop of Stepney, who was actively promoting the work, courteously accepted the suggestions of these bodies, and placed representatives on the committee. One consequence was that the expenditure ran up to nearly £5,000, and there still remains £1,800 to be raised. As can easily be believed there was great difficulty in raising the money in such a district. Of course, the action of the authorities in accepting these alterations was quite the right way of dealing with such an important matter, and these Societies will, we trust, bear most of the extra expense, for if they do not it will not be encouraging to others to seek their aid or allow of their interference.

### New Birmingham Art Gallery.

THE Birmingham City Council at their meeting on the 4th inst., decided to engage the services of an architect to assist them with sketches and plans, and act as assessor on the final plans in the event of competition for the proposed new art gallery and municipal offices. The present art gallery is found to be too small for the adequate display of pictures, necessitating the assembling together of works, which, in such association, kill each other, and instead of providing means of education to the student, are really a source of confusion. It is proposed to utilise the Edmund Street site, recently acquired, by erecting a new picture gallery on the other side of Edmund Street, and maintaining the present gallery as an industrial museum. The proposed new gallery must necessarily have a top-light and be on an upper floor, and it is therefore proposed that the ground floor and basement which will then be placed at disposal should be utilised for the Health Department and the Water Department, for whose requirements additional accommodation is imperatively necessary. This would free the offices now occupied by the Health Department for the extension of the Public Works Committee's quarters. The General Purposes Committee have now been authorised to go to an architect and obtain a sketch plan of a building to cover about 17,500 square feet out of the total area of the site and providing for an Art gallery and offices for the Health Committee and Water Committee. They will come before the Council with a mature proposal, and take instructions as to by what process a final architect should be chosen. It is in contemplation to consult Mr. Aston Webb, architect of the Victoria Courts, who was stated to be prepared to assist them with sketch plans, and to act as assessor on the final plans in the event of competition, Mr. Webb himself being precluded by the pressure of his other professional engagements from submitting more than preliminary plans.

### Art Classes in Birmingham.

THE Birmingham School of Art Committee contemplate opening, at the Vittoria Street Branch School, afternoon classes in drawing, modelling in clay and wax, and modelled design. The classes would be mainly for those engaged in the jewellery and kindred trades, and would be held on three afternoons a week during the school year, at least from the second Monday in September until the beginning of May, each class lasting for two hours. The class fee proposed is 7s. 6d. per term of fifteen weeks, i.e., 15s. the school year, subject to a deduction of 2s. 6d. when paid in advance for the whole school year. All classes will be open to students of both sexes. On the Continent day classes for young work-people have already been established with excellent results. In Paris, for instance, apprentices are allowed to attend day classes in connection with Chambre Syndicate de la Bijouterie, Joaillerie, Orfèvrerie; in this case no deduction is made from the apprentice's wages, and the fee is, as a rule, paid by the employer, and in Germany some industries are allowed two afternoons a week free from any fee for attendance at technical classes. We hope that the committee will secure the requisite number of fifty students to make this scheme possible.

### The National Portrait Gallery.

THE forty-second annual report of the trustees of the National Portrait Gallery has just been issued. The trustees desire to record their great regret that, owing to failing health, Mr. Leslie Stephen, who was appointed a trustee in 1896 in place of the late Mr. W. E. Gladstone, has been compelled to resign his seat on the Board. The treasury has appointed Lord Balcarras, M.P., to fill the vacancy caused by Mr. Leslie Stephen's resignation. Among the donations acknowledged is a portrait of the late William Eden Nesfield (1833-88), who is described as "the eminent architect, whose influence has been so great in the development of Architecture in England," taken in Rome in 1859 by M. Jacob Edouard E. Brandon, presented by Mr. John Hebb.

This is the original of the lithographed portrait published in the July number of the *Architectural Review* for 1898; it is in the original black oak frame, from a design by Mr. Nesfield, and has a characteristic inscription at the back in his handwriting. A portrait of Mr. Robert Mylne, F.R.S. (1734-1811), architect to the New River Company, and the designer of old Blackfriars Bridge, is included in the list of portraits purchased.

### Institute of British Decorators.

At a meeting of the General Council of the Incorporated Institute of British Decorators held at the registered office of the Institute, Painters' Hall, Little Trinity Lane, E.C., on Thursday, June 29th. It was resolved, "That this meeting desires to express its unanimous regret that the decorative treatment of the interior of St. Paul's Cathedral, so far as it has been carried out, has paid too little respect to the Architecture, and tends to disturb the structural effect, to the expression of which it should be the function of coloured decoration to contribute." Some seventy applications for new membership were brought before the Council at this meeting, and about fifty of the applicants were elected fellows, and a few were elected associates of the Institute. Amongst the members accepted by the Council were Messrs. John Jackson and Edward Francis Jackson, of the firm of George Jackson and Son, of 49, Rathbone Place, W.; Mr. Samuel Alon, of the firm of Hampton and Sons, Pall Mall, East; Mr. Ernest Ruscoe, of the firm of Clark and Mannoch; Mr. Charles Albert Hindley, of the firm of Hindley and Wilkinson, Ltd., of 70, Welbeck Street, W.; Messrs Whitehead, Bros., of Wimbledon; Mr. Thomas Kershaw Bonnar, of the firm of Bonnar and Son, of Edinburgh; Mr. H. Liley, of Radnor Place, and others. Mr. Wilfred Nicholson of the Painters' Company, was elected an honorary member. Applications were also received from New Zealand and Bombay, and from various parts of England, Scotland, and Ireland. About 300 decorators have now joined the Institute.

### Architectural Association of Ireland.

THE annual excursion and dinner of this Association took place on Saturday, July 1st. These excursions are arranged for the purpose of studying and sketching both old and modern work, it was decided this year to visit Chester, so as to afford members an opportunity of becoming more closely acquainted with the half-timber style of buildings for which that city is world-famed. The party, numbering thirty, left Dublin on Friday night. Saturday morning was devoted to the Cathedral, where the members were welcomed by the Dean, who kindly drew their attention to the chief points of interest in the building. The cloisters and the beautiful carved woodwork in the choir were greatly admired; but the interior of the Cathedral has suffered somewhat from injudicious restoration. After lunch the party made a tour of the city under the guidance of Mr. Minshall, of the firm of Douglas and Minshall, the well-known Chester architects. This gentleman spared neither time nor trouble in his efforts to assist the visitors. The annual dinner was held in the evening at the Green Dragon Hotel, the President, Mr. George Sheridan, A.R.I.B.A., in the chair.

### Fireproofing Building Material.

In connection with the discussion that has for some time past been going on as to the best method of rendering building material proof against fire, Fire Chief Swenie, of Chicago, a man of wide experience in this line of observation, says it makes little difference whether the house is built of steel girders or not; the danger in such houses as the Andrews home, for instance, is from the great quantity of oiled and varnished woods in the interior, and the rugs and inflammable draperies, the fact being that fire is liable, of course, to start in the basement of any house and the accumulated gases cause an explosion that will burst out the windows and set fire to everything inflammable inside. Furthermore while chemically treated wood is often fire

proof at first, the trouble is that the fireproof quality is not permanent—oxidation goes on all the time, and after a while the preparation loses its effect, the most that it can do being to retard combustion. Mr. Swenie emphatically declares that preparations of this sort are of no value in dwelling house interiors, and that the chemicals cannot be used on woods that are intended to be polished.

**An Archaeological Outing.** SOME fifty members of the Archæological Society had a pleasant excursion to the Sedgemoor churches last Saturday week. The party first proceeded in breaks from Bridgewater to Chedzoy, where the fine old church dedicated to St. Mary was inspected, Lieut.-Col. Bramble explaining the chief points of interest. The many curiously-carved quaint oak bench ends were especially pointed out, whilst the very finely-worked altar frontals, made from an ancient cope discovered under the pulpit during the restoration of the church and a fifteenth century brass, were much admired. The church is of Gothic structure, and is architecturally beautiful. On a buttress on the south side of the church is a sandstone, on which scythes were sharpened by the rebels previous to the battle of Sedgemoor. The tower is a fine one, and there are also several dedication crosses in good condition. The company then drove past the site of the battle of Sedgemoor to the fine old church of St. Mary, Weston Zoyland, where Colonel Bramble pointed out there were the typical Somerset waggon roof and the compass roof side by side. The carved oak benches and the beautiful tower which this church possesses were also explained. It was in this church that hundreds of the rebels were imprisoned after the Sedgemoor fight, and the curious charges for food, &c., for the use of those confined are set forth in an ancient book belonging to the church. Another couple of miles drive brought the archæologists to the Church of the Holy Cross, Middlezoy, which is an exceedingly interesting edifice. It has a splendid oak Jacobean pulpit of 1606, a beautifully carved oak wood screen (early fourteenth century work), a font of the same date, a hagioscope, and a small window, about the use of which archæologists differ. The tracery in the chancel window of this church is generally considered to be the finest of any church in Somerset.

**Wesley's Chapel.** FRIDAY was a busy day at Wesley's Chapel, City Road, London, which was then reopened after having been completely restored and decorated at a cost of nearly £4,000. The decoration of the chapel had never been completed, although its scheme was known. In addition to the old preaching house, Wesley's home and death-place needed attention, for it was closed and practically uninhabitable, and new accommodation was required for those attending the Conference and other large gatherings held at the chapel. Five memorial stones were laid on Friday in celebration of the restoration of the chapel, the opening of new buildings, the dedication of Wesley's House. In the afternoon a bust of the late Rev. Dr. Wm. Fiddian Moulton was unveiled. At a cost of £2,450 new buildings have been erected near the chapel, containing reception-rooms, retiring-rooms, and cloak-rooms; £1,057 has been spent on internal decoration; the front has been pointed down and cleaned, and the portico, with its six medallions bearing the dove and olive branch, has been cleansed at an outlay of £246; and £200 has gone in incidental expenses. The chief work has been the internal decoration of the chapel, which has been carried out with taste and feeling by Messrs. Gordon, Lowther, and Gunton. The dominant note is simplicity, white and gold being the only colours employed. The domed ceiling is pure white until the centre-piece is reached, from which is suspended a graceful electric chandelier. At the corners are raised cherubim and rayons, which have been gilded, and stand out delicately against the white background. The wall tint is a faint green with relief in gold.

**The "Burke" Memorial.** THE measured drawing illustrated on this page is of the cenotaph, erected by public subscription, in Glasnevin Cemetery, Dublin, in memory of the late Mr. Burke, Permanent Secretary for Ireland. It is considered to be one of the most beautiful designs for a memorial of the dead, in existence in any of the cemeteries in the United Kingdom, and was designed by a Dublin

THE BURKE MEMORIAL, GLASNEVIN CEMETERY, DUBLIN. MEASURED AND DRAWN BY T. W. AYDON.

architect, Mr. Drury. The plan throughout is octagonal, except the cross, which is square. The materials used in its construction are blue and white Irish limestone, tastefully arranged in courses, so as to give the most pleasing effect in colour; the central or main

shaft is of polished dark grey granite. Mr. T. W. Aydon's drawing shows how perfectly proportionated a piece of monumental Architecture this memorial is. The monument deserves a better site to stand upon, for at present it is somewhat difficult to find, being placed in rather an obscure position; to the right from the main entrance to cemetery.

**German and Flemish Painters.** AT the Manchester Art Museum, Ancoats, last week, Mr. T. Collins, the curator, delivered an address on "German and Flemish Painters." He said Albrecht Dürer and Hans Holbein were the bright expositors of the German Renaissance, and gave in their fullest strength and directness the general trend of the national mind. They embodied the accumulated influences of all that was implied by the revival of learning. Italian artists lost themselves in the myths and sensualities of pagan Rome and Greece. The artists of the Low Countries went forward interpreting the new era in their own strong, realistic way. The brothers Van Eyck, of Bruges fame, with their subtle colouring, infinite patience in detail, combined with technical excellence, carried Flemish art to its highest level. The death of Memling deprived Bruges of its last real representative. His works were noted for the peculiar purity of their colour, and the piety and simplicity of his religious subjects. The famous blacksmith Matsys, of Antwerp, was the founder of the Netherlands school of painters. His work was a combination of the old and new styles; it embraced and excelled the colouring of the Van Eycks, the purity of feeling of Memling, and the elaboration of Rubens. Ruskin had described Rubens as "a wealthy, worthy, kind-hearted and courtly-phrased animal, without any soul." In the bold conceptions of his pictures, the daring schemes of colour, he approached Veronese, and in the drawing of mere outward form he was unrivalled. Teniers was a most prolific painter; he seemed to have viewed life with the eyes of a serio-comic artist. As a delineator of the lighter side of human social life he had no equal.

**Old Sauchie Manse House.** THIS old roofless ruin adjoining the estate office at Sauchieburn is being put in a state of preservation, for it had become dangerous owing to ivy, which had become so strong that it had penetrated through every nook and crevice of the building, filling up the vents and bulging out the walls. When the building was originally erected it had occupied two sides of a square, with the door in the angle, and consisted of an entrance hall, with the main stair leading up to the first floor. The rest of the ground floor was arched over, and the light penetrated the vaults from slits in the external walls. Over the vaults were placed the living rooms, and over these the bedrooms. Turrets with fine moulded corbelling are placed on each of the corners of the north elevation, while in the centre of the east wall a bow window, carried on similar corbelling, contained the turnpike stair which led to the bedrooms. Another turret had at one time existed on the south-west corner of the entrance hall, but this had been removed at some previous alteration. The kitchen and offices of the old mansion have been incorporated into the present estate office, but the kitchen fireplace still remains, and is large enough to have roasted an ox whole at one time. In carrying out the work of preservation it was found necessary to tie the walls of the entrance hall together with malleable iron tie-rods. Parts of the walls which had fallen down, and other parts which had become loose, had to be taken down and rebuilt. The whole of the walls outside and inside were pinned and pointed with Portland cement. The accumulations of many years had to be removed from the top of the vaults, which were levelled up and covered with concrete to preserve the arches. The work is now nearing completion, and shows a very fine specimen of the domestic architecture of the latter end of the sixteenth century.

## Professional Practice.

**Beeston.**—Memorial stones of a new Wesleyan Mission Chapel were laid last week at Beeston. The building is to occupy a site on Queen's Road, immediately in front of the present school chapel, and is designed to accommodate a congregation of over 400, the dimensions being 52ft. by 43ft. across the transepts, and 34ft. across the nave. The chapel is designed in the Gothic style, and will have a traceried window in the front gable, flanked by a porch on one side, containing stairs to the gallery, and on the other side by a square tower terminating with a spire running to the height of 62ft. The roof will be partially open, with arched work under the timbers and pitch-pine ceiling. The glazing is to be of Cathedral glass with ornamental leaded lights, and the internal fittings will be of pitch-pine. The chapel will have two vestries, for the minister and choir, and a recessed arch behind the communion table will form a small chancel, on one side of which the organ chamber will be situated. The architect is Mr. John Wills, F.S.Sc., of Derby and London, and the contractor is Mr. W. Edwards, of Derby.

**Coatbridge.**—The fine new church of St. Augustine, erected by the Roman Catholic congregation, Langloan, Coatbridge, was opened recently. The building is in the Early

builders were received, the amounts at which they were willing to carry out the work varied from £6,225, the highest, to £4,071, the lowest, at which sum Messrs. Kerridge and Shaw offered to complete it. Mr. Alderman Paxman generously offered the sum of £2,000, which he subsequently increased to £2,500, in view of the reduced estimate, making the tower, the construction of which at one time seemed doubtful, a possibility. The Committee recommended the Council to accept the tender of £2,965 12s. of the contractors of the main building, Messrs. Kerridge and Shaw. With regard to the hall and main staircase, a project had been gone into for an ornamental marble hall with columns and staircase, at a cost of about £5,000, under a suggestion which had reached the Committee that it might be carried out by the munificence of a private donor. This led to the omission from the contract of certain parts of the needful work for this part of the building as reported in November, 1898, by the architect, Mr. John Belcher, F.R.I.B.A., who then stated that, as these expectations had not been fulfilled, it would be necessary to deal with this matter in a short time, and make the requisite provision. Having considered the matter, the Committee recommended the Council to accept the lowest tender, that of Messrs. Farmer and Brindley, of London, of £1,086 10s., for constructing the main staircase in marble and supporting and fixing four marble columns for the staircase. The fourteen columns for the hall in Bath

Ernest E. Ellis, of Market Street, Exmouth, is the architect.

**Hanley.**—The foundation stone of a new church of the recently-constituted parish for St. Jude, Hanley, was laid last week. The new church will consist of a nave with aisles on either side, a chancel with organ chamber and vestry on the north side, and a morning chapel on the south side. The nave will be 80ft. long, 30ft. wide, and 35ft. high to the eaves, and 53ft. to the ridge. It will be separated from the aisles by five arches of stone and brick on either side, springing from stone piers. At the west end of the south aisle will be the baptistery. The chancel will be a continuation of the nave without break. The building will be of red brick with stone dressings to the windows and doors. The roof will be tiled. A small spire, containing an exhaust ventilator, will break the length of the ridge at the junction of the nave and chancel. The church will be seated for 800 worshippers, and the cost of the building is estimated at £7,000. The site, which cost £1,050, is situated at the corners of Beresford Street, Seaford Street, and Victoria Road. Messrs. Scrivenor and Sons are the architects.

**Leeds.**—The Leeds School Board have just erected buildings in Blenheim Walk, Leeds, for the purpose of a home and schools blind and deaf children, and these were opened last Wednesday. Covering an area of 1200 square yards, and designed in the Gothic style, the building has an impressive appearance. It is three storeys in height, faced with pressed bricks with sand-stone dressings, the central entrance being of Morley stone. Each department is separate and distinct for teaching purposes, and easy of approach to the domestic department. Five staircases from the ground floor lead to the separate departments, and in addition there are exit corridors, and a staircase from each department to the playgrounds. Accommodation is provided for 108 boarders (59 blind and 49 deaf children), and 100 day scholars (30 blind and 70 deaf); the blind children are all to be taught on the ground floor, and the deaf children on the floor above. The central entrance and staircase divide the educational part of the building from the domestic part. To the right is the blind assembly hall 59ft. by 29ft., with seven class-rooms, each 20ft. by 15ft., a workroom about the same size, and four music rooms. To the left is a waiting room, superintendent and matron's room, committee-room, and dining hall, with cooking kitchen, scullery, pantries, servants' kitchen, &c. All these are on a commodious scale. The first floor is very similar in arrangement, and has an assembly hall, eight class-rooms, a sewing-room 26ft. by 20ft., blind boys' dormitory, bath-rooms, and lavatories. The whole of the second floor is set apart for boarders and staff. All the staircases are of stone, and the main corridors and the floors over the boiler-house, landings, and apparatus-rooms are fireproof. Every apartment is well lighted from wide areas, and there is a complete installation of electricity. A special feature is the arrangement for heating and ventilating, which has been carried out by Mr. Key, of Glasgow, on the "Plenum" system. Fresh air is driven in by means of two fans worked by a Bellis engine, the air having first passed through a screen of cocoanut coil to deprive it of smuts and other impurities. In cold weather the air is first heated to a mechanical nicety by means of hot water pipes, and the atmosphere of any and every apartment can be renewed at least a dozen times in the hour. Mr. W. S. Braithwaite has been the architect, and the brick, stone, and joiner's work has been carried out by Mr. J. H. Wood. The total expenditure has been close upon £30,000.

**London, S.W.**—King's College School new buildings at Wimbledon were opened last week by the Duke of Cambridge. The new buildings consist on the ground floor of six new class-rooms, each 24ft. by 17ft., and 12ft. high. These are connected with the old school buildings by a wide corridor. On the upper floor is the great

ADDITIONS TO KING'S COLLEGE SCHOOL, WIMBLEDON. THE LATE BANISTER FLETCHER AND BANISTER F. FLETCHER, ARCHITECTS.

Decorated style, with nave and aisle, chancel and chapels on either side. The nave is divided into seven bays. There are the usual recesses for confessionals and a baptistery. The west gable has a fine large rose window, richly traceried. The entrance is through deeply-recessed arches and there is a niche containing a statue of the patron saint of the church. There is a gallery for the choir and organ in a transept off the south aisle. The internal length of the church is 128ft., the width being 60ft., and the height 60ft. The church accommodates about 1000 persons, and has cost about £10,000. Messrs. Pugin and Pugin, of London, were the architects.

**Colchester.**—The Victoria Tower in the New Town Hall at Colchester was the subject of a special report by the Committee at the meeting of the Town Council last Wednesday. This structure, from the parapet to the summit, comes under the category of ornamental work, and had, therefore, to be provided by private munificence, and not from the rates. When, in November last, the tenders from the

stone were tendered for by Messrs. Kerridge and Shaw for £94 10s., which the Committee recommended should be accepted. An anonymous donor had offered £250 towards the cost of this work. The report was adopted. It was also announced at the meeting that Mr. W. Nocton had offered a gift for the decoration of the new Town Hall, while Mr. Arthur Ager had promised to present a pair of standard lamps for placing at the front entrance, at a cost of £85, a cheque for which amount had already been received. Mr. Dennis Jeffery had also offered a clock suitable for the Moot Hall or one of the principal rooms in the building.

**Exmouth.**—A very large building, composed principally of iron, wood, and glass, is to be erected at Exmouth for horticultural purposes. The structure will be over a quarter of a mile in length, and of an ornamental character, with a dome in the centre nearly 80ft. high, and towers at intervals about 45ft. high. The width of the building in the centre will be 44ft., and at the narrowest part 26ft., and will be heated with hot water. Mr.

all, which is 84ft. by 42ft., and is very lofty. It is covered with a decorative open timber roof of queen-post type. The walls of the hall are of red brick, and the roof is stained a dark colour. It is intended to place a gallery across the entrance end of the hall. The exterior of the building is faced with red bricks. The mullioned and mullioned windows are executed in Corsham Down stone. Messrs. Flint Brothers, of Kennington, did the stone work and carving. The architects were the late Professor Banister Fletcher, F.R.I.B.A., and Mr. Banister F. Fletcher, A.R.I.B.A.

**London, N.W.**—The competition for new baths and warehouses at St. Pancras was limited to six competitors, who were Messrs. Arnor and Pinches, Spalding and Cross, Rensson and Son, R. Stephen Ayling, F. J. Smith, and T. W. Aldwinckle. Each competitor received an honorarium of £50. The site with which the competitors had to deal is awkward in shape and limited in area for the

**Loughborough.**—Foundation stones of a new Wesleyan Chapel at Loughborough were laid last week. The site has a frontage of 62½ft. in Ashby Road, with a depth of 100ft., the area being 690yds. The dimensions of the school chapel will be 68ft. extreme length and 33½ft. in breadth, 52ft. across class-room to transepts. The material for outside walls is brick, and the style of Architecture modern Gothic. There will be no galleries, but seating accommodation is to be provided for 260 adults. There will be six spacious class-rooms and one vestry. Adjoining the site 604 square yards of land have been purchased, with a view to reserving the same for a new chapel, the cost of the land amounting to £280. The minister's house will have a frontage to the site on Radmoor Lane of 36ft., and to the side street of 68ft. 9in., the area being 250yds., and is to be erected of brick, in keeping with the contiguous school chapel. The dimensions of the minister's house are to be 34ft. in length and 32ft. in breadth, and it will

view of the stage and proscenium is obtained. The style of decoration is Oriental throughout, with a profusion of brightly gilt and coloured artistic designs in plastic. The grand circle has seating accommodation for over 200 people. Behind the stalls, and separated from them by an upholstered barrier, is the pit, which has a waiting room in connection with it. The seating here consists of upholstered forms. The balcony, which is above the grand circle, is commodious, and contains similar seating arrangements to the pit. Behind it is the gallery. There are lavatories and other conveniences all over the house, and the exits are well arranged; the theatre will hold, roughly, about 2,500 persons, and this number can be cleared out in the remarkably short space of one and a half minutes. The stage, which is very conveniently arranged, measures 56ft. by 35ft. The auditorium is 80ft. by 54ft. wide, and the height of the building from the floor of the auditorium to the top of the dome is 80ft.

PAIR OF SEMI-DETACHED VILLAS AT WHITBY. G. SCAIFE FRENCH, ARCHITECT.

amount of accommodation they were asked to provide. It has frontages to roads on three sides, the Prince of Wales Road on the south and being the shortest frontage, while the other two frontages in Willes Road and Afton Road are long. The accommodation required is two swimming baths for men, each 50ft. by 35ft., a first-class women's swimming bath 75ft. by 20ft., and a second-class women's swimming bath, 50ft. by 20ft., a large number of shower baths, and a complete washhouse and laundry. The first-class men's swimming bath is also to be used as a public hall. £10,000 is the sum to which the cost has to be limited. Mr. T. W. Aldwinckle's designs, which have been selected, show the men's entrances in Prince of Wales Road, giving a separate entrance to each class. The women's entrance and washhouse entrance are in Afton Road. The first-class men's shower baths are in the basement, and the women's shower baths are on the first floor.

have three floors and basement. The various apartments will be spacious and lofty. The total outlay on the minister's house will be £1,025, including £125 cost of the site, whilst the school chapel will incur an expenditure of £1,600, inclusive of £345 for site. Messrs. Barrowcliffe and Allcock are the architects, and the contract for the work has been let to Mr. W. F. Harding, whilst the necessary brickwork is in the hands of Messrs. William Moss and Sons.

**Newport, Mon.**—The new Empire Palace of Varieties was opened last week. The building is a thoroughly up-to-date music-hall, and has been erected at a cost of about £20,000. The work has been done according to the designs of Mr. Frank Matcham. One good feature in the design is the provision of sufficient accommodation, not only in the house itself, but in the entrance halls. This is obtained by a liberal provision of crush rooms. From the crush room an excellent

The utmost care has been taken to make the building fireproof, the stage and dressing-rooms being separated from the auditorium by a fireproof curtain and iron doors.

**Whitby.**—The pair of semi-detached villas illustrated on this page have just been completed. They are built in Argyle Road, Whitby, near the sea, for Messrs. J. Rennison, of Darlington, and T. W. Rennison, of Whitby. The buildings are faced with pressed bricks, moulded strong courses, stone dressings, &c., and the gables are framed in heavy pitch pine, and cemented. The principal rooms and staircases are elaborately finished in pitch pine. Mr. Palpaman has executed the mason and bricklayers' work, Mr. J. Porritt the joiner work, Messrs. Smithson and Taylor the plastering, and Mr. Rennison the plumbing work. Mr. G. S. French, of West Terrace, Whitby, is the architect, and the work was carried out under his supervision.

## THE R.I.B.A. EXAMINATIONS.

The following candidates at the June, 1899, Examinations of the Royal Institute of British Architects have passed:—

### Preliminary.

S. J. W. Adkins, Hastings; R. J. Archibald, Middlesbrough; T. M. Arthur, Airdrie, N.B.; R. A. Barber, Reigate; A. J. Barclay, Montrose; W. J. R. Barker, Manchester; H. C. Bartholomew, Eastbourne; T. A. Beavan, Cardiff; F. R. Berry, Lincoln; C. T. Bevis, Southsea; H. J. Bonwick, London; G. A. Boswell, Wolverhampton; F. E. Bowdler, Shrewsbury; H. M. Bowes, London; H. P. Briggs, London; F. H. Bromhead, Tipton, Staffs.; C. F. Callow, St. Leonards-on-Sea; V. Calvert, Bradford; W. N. Castelloe, London; R. P. Chamberlain, Leicester; C. B. Cleveland, Cambridge; W. B. Colthurst, Taunton; R. O. Constant, Eastbourne; G. H. Crane, London; B. E. Crockett, London; H. G. Culver, London; W. R. Davison, London; D. W. Day, Leicester; H. Dawson, Sheffield; W. J. Delbridge, London; Miss C. M. Dale, Buxton; A. P. Dowglass, Reigate; E. H. Edleston, Manchester; J. A. G. Elliot, Edinburgh; E. M. Ellis, London; T. C. Evans, Hanley; N. B. Fairweather, London; J. W. Farmer, London; W. H. Garwood, Norwich; J. J. Glendinning, Halifax; L. M. Gotch, Kettering; E. T. Goff, Lowestoft; H. J. Gravenor, London; C. I. Greenhow, Newcastle; E. G. H. Gunn, London; H. Hall, Hastings; T. W. Hamilton, Greenock; J. L. Hampson, Bolton; T. G. L. Hanks, Reading; E. L. Haynes, St. Albans; J. H. Hargreaves, Manchester; F. W. Hayward, Taunton; A. W. Heath, Eastbourne; James Henry, London; J. B. Hector, Aberdeen; P. T. Hildesley, London; B. C. Hill, Bristol; H. Hill, South Shields; Miss F. F. Hobson, Belfast; A. F. Holden, Chesterfield; W. F. C. Holden, Cambridge; G. O. Howship, London; C. J. S. Holcombe, London; R. J. Hughes, Llanfairfechan; F. J. Humphrey, Worthing; C. W. Hitchcox, Newport, Mon.; O. Ingham, Elland, Yorks.; R. W. Ingleby, Sunderland; T. W. Jacobs, Cardiff; G. H. Jackson, Bournemouth; J. M. Jenkinson, Sheffield; E. N. Johnson, Newport, Mon.; R. Johnston, Swindon; L. Judge, London; E. M. Joseph, London; E. R. Kennedy, Belfast; L. Kesteven, London; F. Lansdown, Lincoln; M. C. M. Leggett, Reading; T. S. Lello, Sheffield; L. Long, London; R. Longden, Burslem; C. G. McDowell, Dublin; J. N. K. McKilliam, London; A. D. MacLaren, Manchester; S. Maddock, Frodsham, Cheshire; W. P. Major, Somerset; A. J. Marshall, Windsor; R. P. Marshall, Sheffield; J. I. Massey, Bolton; J. G. P. Meaden, London; F. Meakin, Derby; H. E. Moore, Redcar, Yorks.; J. A. Millar, Glasgow; H. S. Morris, London; E. J. Mundell, Poole, Dorset; J. Myers, London; N. T. Myers, Watford; W. R. Osborne, Swindon; F. Osler, Halifax; J. Owen, Blaenau Festiniog, Wales; W. B. Oxley, Leicester; C. E. L. Parkinson, Chelmsford; A. G. Parker, Worcester; C. T. S. Paul, Bristol; C. H. Perkins, Wokingham; P. C. Pilling, Bolton; Alan Potter, London; Miss B. Potts, Banbury; J. C. Procter, York; J. W. Ramsbottom, Stockport; K. H. Read, Reading; F. S. Reynolds, Birmingham; H. J. Richardson, St. Leonards-on-Sea; H. P. Roberts, Cardiff; A. Round, Birmingham; W. S. Rumsby, Bournemouth; G. S. Salomons, Manchester; F. Sanderson, Guisbrough; J. M. Sheppard, London; A. W. Sherwood, London; G. D. B. Shepherd, London; C. F. Skipper, London; C. H. Smith, London; A. Smithers, London; E. G. W. Souster, Northampton; J. A. Speir, Cardiff; H. Spencer, Notts.; W. R. Spurr, Batley; F. A. Sprules, London; E. Stockwell, Leeds; R. H. Stone, London; M. J. Styles, Rugby; F. Sutton, Reading; W. H. Swann, Nottingham; J. R. Sykes, Brighton; T. J. Tatham, London; J. H. Taylor, London; C. J. Thompson, London; C. Thorp, Manchester; F. J. Toop, Lincoln; J. N. R. Vining, London; T. W. Watkins, Ramsgate; J. Wilcock, Shipley, Yorks.; J. E. Wilkinson, South Shields; F. Willey, York; S. G. N. Willson, London; W. H. B. Wright,

Lincoln; C. S. Yates, London; Thos. Young, S. Shields; L. S. Youngman, Bournemouth.

### Intermediate.

C. L. Fleming-Williams, London; L. G. Detmar, London; Douglas Wood, Hull; J. W. Grove, Reigate; H. W. Cubitt, Lowestoft; S. J. Halse, London; I. M. Kent, Norwich; L. L. Bright, Nottingham; A. E. Robertson, London; T. H. Gibbs, London; H. D. Simpson, Edinburgh; E. B. Norris, Birmingham; W. M. Dean, Gravesend; P. J. Haywood, London; H. B. Mackenzie, Cardiff; M. Stillman, Cheltenham; R. R. Gall, London; H. A. Rowbotham, Denbigh; C. E. Monro, Glasgow; H. W. Hobbiss, Birmingham; S. R. Oakes, Manchester; W. St. Leger Crowley, Cardiff; P. A. Hinchliffe, Barnsley; W. J. Davies, London; A. M. Peart, Newcastle, Staffs.; M. A. Slater, Peterborough; F. C. Wrigley, London; R. T. Grove, London.

### Final.

R. T. Barker, London; H. T. Bromley, London; H. H. Dunstall, London; H. E. Gilford, Nottingham; Charles Hale, Kettering; John Hunt, London; G. E. Kendall, London; T. G. Lucas, Hitchin; H. A. Neubronner, London; W. G. Ross, London; W. M. Settle, London; T. Sharpe, Kendal; H. F. Traylen, Leicester; T. H. H. Vowles, Oldham; P. J. Warman, London.

## Keystones.

**The City Orthopedic Hospital was Re-opened** last Wednesday, after having been rebuilt. The hospital authorities are appealing to the public for £10,000, to clear off their debts.

**The New Promenade at Bowling Park, Bradford**, was formally opened last week, by Mr. C. Crabtree, Chairman of the Parks Committee of the Bradford City Council. The promenade has been laid at a cost of £250, and is 200 yards long and about 16 yards wide.

**The Foundation-stone of a New Church** in connection with St. Augustine's Mission, Lillie Road, Fulham, was laid last week by the Marquess of Lorne. The portion of the church now to be built includes the nave, aisles, and baptistery, and will cost £7,000, of which about £5,000 has already been raised.

**A New Mission Hall at Keighley** was opened last week which has cost about £2,650 to erect. Only the upper storey is at present fit for tenancy. This includes a commodious mission hall and two classrooms, divided from the hall by a movable partition, and giving a total seating capacity of about 600. Below there will be a room for Band of Hope meetings, an infants' school, a room for young women, and the ragged school.

**Discovery of a new Raphael.**—At an exhibition of sacred art at Como recently, a canvas representing the "Massacre of the Innocents" attracted the attention of many experts, who attributed it to Raphael. The picture was heavily coated with varnish, and some of the surface had to be scratched away so that the signature could be examined. This shows the date of 1510, which would put the work ten years before the painter's death. The proprietor is Dr. Biondi, of Parma, who can trace the picture back, historically speaking, near the painter's lifetime.

**Art at the Paris Exhibition of 1900** will be well represented. There will be a retrospective view of French painting and sculpture that will be practically a summary of the salons from 1800 to 1890. The Palaces of Fine Arts now being built in the Champs Elysées, where the works will be exhibited, are in themselves remarkable; the main palace will be one of the most beautiful buildings in Paris, and, like the columns of the adjacent Alexander III. bridge, will be decorated by groups and single statues by eminent sculptors. The honour of the idea of erecting permanent buildings is due to M. Picard, the Commissioner-General, who determined that the Exhibition should give an immense impulsion to decorative art.

**The Houses Occupied by Lord Chatterbox and William Pitt** at Bath have had memorials affixed to them by the Bath Town Council, and Lord Rosebery has been asked to unveil them.

**The New Central Hospital for Liscard** is being erected from public subscriptions in memorial to the Queen's Diamond Jubilee. The foundation-stone was laid last week on site in Liscard Road, on the north side of Central Park.

**Munificent Donations to Norwich.**—Late Miss Letitia Gannon has bequeathed £2,340 to build a wing of the Jenny Holme Infirmary, to be named after her, and she also given £500 to Norwich Cathedral in aid of the restoration. The entire fabric of the cathedral is now completely restored inside and out, and the scaffolding is already erected to save the cloister, which is one of the most beautiful in the country.

**The New Godley Bridge, Halifax**, corner stone of which was laid by Alderman Gankroger last week, is estimated to cost about £6,000. The new bridge will admit of a roadway underneath 40ft. wide, and the span will be sufficiently lofty to permit of tramcars passing underneath. The width of the new erection will be 50ft. at the base and 40ft. at the top. Messrs. J. Charnock and Sons are the contractors for the masonry, their tender amounting to £2,979 1s. 8d., and Messrs. Pierson and Co., London, are supplying the girders, their contract amounting to £3,089 18s. 9d.

**Shiloh Calvinistic Methodist Church, Aberystwith**, has just been reopened after restoration, the erection of a new schoolroom and manse on the vacant piece of land attached to the chapel. The chapel and other buildings are now lit by the electric light, and are also fitted up with improved heating apparatus. The contract for the building of the schoolroom and manse has been executed by Messrs. Owen Brothers, and the contract for the renovation of the chapel by Mr. Richard Jones, of Cambrian Street, Aberystwith. The cost of these improvements has been about £1,000.

**Science and Art Department.**—In consequence of the retirement, which took place last week, of Major-General Sir John F. D. D. Nelson from the Secretaryship of the Science and Art Department, after forty years in public service, the Duke of Devonshire, President of the Council, has made the following appointments:—Sir George W. Kekewich, the present Secretary of the Education Department, to be also Secretary of the Science and Art Department; Captain W. de Abney to be the Principal Assistant Secretary of the Science and Art Department; Mr. Tucker to be the Principal Assistant Secretary of the Education Department.

**The Alhambra, Blackpool**, has just been formally opened. The foundation stone of the place of amusement was laid on December 18, 1897. The building, which has cost about £400,000, occupies a commanding position on the Central Beach, and is built upon the site of the old Prince of Wales's Theatre, and market and baths. Though in an incomplete state, the Alhambra opened for Whit-week, with the exception of the ball-room, which is closed again, and since then workmen have been busy putting the finishing touches to it. With the exception of that part fronting Bankney Street, the elevation is of attractive design. The main entrances are on the front, that to the ball-room being especially fine, and of marble of all shades having been used in its construction, both here and in all parts of the structure. The variety theatre, which holds over 3,000, is situated at the extreme end of the block, and is excellently appointed, the stage being visible from all parts of the house. The circus is at the other end, and here, too, the decorations are of a most sumptuous character. The circus will comfortably accommodate 2,500. The space between the variety theatre and the circus is taken up by entrances and a handsome marble staircase which leads to the ball-room. There are also a restaurant and open-air balconies. Artistic accommodation is well seen to, and the electrical plant, &c., is in the spacious cellars.

**New Vagrant Wards at Malton.**—The Malton Board of Guardians intend to apply for permission to borrow nearly £500, additional required in the construction of the new grant wards at the workhouse. The total to be borrowed for the purpose is about £2,400.

**The Building of the Chancel of Llan-the Church,** together with the restoration of the old building, is being carried out by Messrs. Charles Davies and Co., contractors, at estimated cost of £1,000. Mr. W. Williams, Brecon, is the architect.

**The Colossal Statue of Oliver Cromwell,** which is to be erected in the garden of Westminster Hall, it is stated, will be unveiled by Lord Rosebery, the private donor of Thorny-tiff's bronze effigy of the illustrious Englishman, but it will scarcely be possible to perform the ceremony before Parliament rises for prorogation.

**The Chelsea Hospital for Women** will be opened to in-patients from the middle of July to the end of September, in order to permit of enlargement and modernising of the operating Theatre, installation of a hot-water pipe and the electric light, and of some other matters. These improvements will cost nearly £3,000.

**New Buildings at South Kensington Museum.**—In reply to a question of Sir M. Montagu, in the House of Commons last day, as to the advisability of making arrangements for the erection of a public clock some prominent part of the exterior of the Museum buildings at South Kensington, especially in view of the fact that there was such clock westward from Hyde Park near within the four-mile radius, Mr. Montagu-Douglas said the matter should receive attention.

## New Companies.

**Thomas Rees and Co. (Cardiff), Limited.**—This company was registered on June 22nd. Mr. H. Atkins, Limited, 23, Bouverie Street, Cardiff, with a capital of £2,000 in £1 shares, to carry on the business of auctioneers, surveyors, architects, land and estate owners and agents, &c. ## CONTRACTS OPEN.

### BECKENHAM URBAN DISTRICT COUNCIL.

#### ELECTRIC LIGHT STATION. TO BUILDING CONTRACTORS.

The Beckenham Urban District Council invite TENDERS for the ERECTION of an ELECTRIC LIGHT STATION.

The works include the erection of boiler, dynamo, and destructor houses, and chimney shaft 120ft. high, together with the construction of an inclined approach road and tipping-floor to destructor.

The site of the proposed buildings is on the Council's land adjoining the Railway at the south end of Arthur-road, Beckenham.

Drawings may be seen, and bills of quantities, specifications, and forms of Tender may be obtained, at the Office of Mr. JOHN A. ANGELL, Engineer to the Beckenham District Council, on deposit of a £5 Bank of England note, which will be returned on receipt of a bona-fide Tender.

A clause will be inserted in the contract providing that the contractor shall pay to the workmen employed in the execution of the work the wages generally accepted as current for workmen engaged on similar work in the district.

Tenders (inclosed in an envelope to be supplied), duly sealed and endorsed "Tender for Electric Light Station," to reach the undersigned not later than FOUR p.m. on MONDAY, JULY 17th, 1899.

The Council do not bind themselves to accept the lowest or any Tender.

By order,  
F. STEVENS,  
Clerk of the Council.

June 27th, 1899.

## BOWER & FLORENCE, Polished Granite Manufacturers, ABERDEEN, N.B.

London Office: 64, FINSBURY PAVEMENT, E.C.  
Quarries: PETERHEAD, N.B.

### TO BUILDERS.

The Committee of the Victoria Hospital, Folkestone, are prepared to receive TENDERS for BUILDING A NEW WING to their Hospital from plans and specification prepared by their Architect, Mr. H. PERCY ADAMS, F.R.I.B.A., 28, Woburn-place, Russell-square, London, W.C. Tenders required on JULY 20th, 1899. Builders desirous of Tendering to apply to the Architect for a copy of the quantities, for which they must deposit with him a Bank of England £5 note on application, which will be returned on receipt of a bona-fide Tender.

The competition will be limited and the Builders selected from those applying for the quantities.

The Committee does not bind itself to accept the lowest or any Tender that may be submitted.

BUILDINGS. FOR WHOM. FROM WHOM, FORMS, &C.

Catford, S.E., H. F. Harrington Philips, Norfolk, & Four Shops Prior, Architects and Surveyors, 4, Station Buildings, Catford, S.E. 1

### ROWLEY REGIS URBAN DISTRICT COUNCIL.

Builders and Contractors are invited to TENDER for the EXTENSION of the COUNCIL OFFICES at Lawrence-lane, Old Hill, Staffordshire.

Plans and Specifications may be seen at the said Offices on week days from 6th to 15th July, 1899, inclusive, between the hours of 10 a.m. and 4 p.m., excepting Saturdays, and then from 10 a.m. to 1 p.m.

Quantities can be obtained on application to the Architects, Messrs. Meredith and Pritchard, Bank-buildings, Kidderminster, on payment of £1 1s., which will be returned in each case after receipt of a bona-fide Tender on the Council's form.

Tenders must be endorsed and in my hands at the said Offices not later than 12 o'clock on JULY 17th, 1899.

The Council do not bind themselves to accept the lowest or any Tender.

By order,  
DANIEL WRIGHT,  
Clerk.  
1

June 6th, 1899.

### CORPORATION of LONDON. PUBLIC HEALTH DEPARTMENT. TO BUILDERS AND OTHERS.

The Streets Committee of the Corporation will meet at the Guildhall of the City of London, on TUESDAY, JULY 18th, at HALF-PAST ONE o'clock precisely, to receive TENDERS for the CONSTRUCTION of UNDERGROUND CONVENIENCES in Aldersgate-street (near Edmund's-place), according to plans and specification to be seen at the office of the Engineer to the Corporation, at the Guildhall.

Tenders are to be on the forms supplied at the said office, sealed, endorsed "Tender for Underground Conveniences," addressed "The Town Clerk, Public Health Department, Guildhall," and delivered before HALF-PAST ONE o'clock on the above-mentioned day.

Security will be required for the due performance of the contract.

## TESTING DRAINS AND FITTINGS.

By T. E. COLEMAN, F.S.I.

WHENEVER a system of house drainage is being carried out, it is essential that the whole should be subjected to some sufficient proof or test of soundness and suitability for the important work which it has to perform. Any defects which are revealed by the application of the selected test can then be easily remedied at a comparatively small cost, instead of afterwards becoming a constant source of inconvenience and expense, if not of absolute danger to health.

At the same time it cannot be too strongly borne in mind that, even though the drains and fittings successfully comply with every sanitary requirement when first constructed, yet the constant wear and tear coincident upon their everyday use requires that a careful examination and testing as to their continued efficiency should take place at stated intervals. If this course were more generally adopted, a large amount of illness would undoubtedly be prevented.

Drains may be tested by filling them with water, or forcing in smoke and air under pressure. These are severally known as the "water," "smoke," and "air" tests. Another method, known as the "scent" or "smell" test, is also frequently used in the examina-

found to be thoroughly sound in all respects, the fittings are then permanently fixed in their respective positions and the "smoke" test is applied at the completion of the work. At the time of making the smoke test, the joints between the fittings and the soil pipe branches should be carefully examined to make sure that all the various connections are perfectly secure.

When carrying out the water test to soil pipes, the ends of the branches, together with

FIG. 2.

FIG. 3.

FIG. 4.

the lower end of the soil pipe, must be properly closed before filling with water. The ordinary expanding drain plugs may sometimes be used for this purpose, but in places where a great head of water is required they are liable to be forced out unless securely strutted in addition, or otherwise supported. A convenient form of stopper for the branches of cast-iron pipes is seen in Fig. 2. It consists of an iron plate held firmly in position by means of a bridle and screw fastening. In cases where it is necessary to close the spigot end of a pipe,

drain increases, the float (D) will rise (as indicated by the dotted lines), and should there be no leakage, the float will remain stationary when the tap (M) is closed. When testing old drains, which are not accessible from an inspection chamber, the smoke may be introduced through a trapped gully as shown in Fig. 6.

In the United States the atmospheric, or air test, is also used in sanitary work. Air is forced into the drains and soil pipes by means of a force pump, until a pressure of 10 lb. per square inch is registered by the manometer, or mercury pressure gauge. This pressure of 10 lb. per square inch is equivalent to a column of mercury 20 in. high, as shown by the gauge or indicator.

The "scent" or smell test is frequently adopted for the examination of existing drains in order to indicate the presence of any leakages therein. It may be applied in several different ways. The "peppermint" test consists in pouring oil of peppermint and a quantity of boiling water into the drain at some definite point. Care must be taken that all the openings to the drain have been previously stopped or sealed with water, whilst the opening through which the peppermint and hot water are poured must be closed immediately afterwards. Should the well-known pungent odour characteristic of this chemical be then detected, it is evident that the escape proceeds from some defect within the drainage or

FIG. 1.

FIG. 5.

FIG. 7.

tion of existing sanitary work, when any of those already mentioned cannot be conveniently adopted.

In new work the different sections or lengths of drain must be tested before being covered in, so that any leaky joint or defective pipe may be at once detected and afterwards made good. Sufficient time must be allowed for the cement—or other material used for making the joints—to become thoroughly hardened and set before attempting the test.

The most satisfactory test for ordinary drainage work is the "hydrostatic" or water test. The method generally adopted is to close the lower end of the drain by means of a suitable plug or stopper, a bend and vertical pipe being temporarily fixed in position at the upper end, so that 5 ft. or 6 ft. head of water may be obtained. The pipes are then filled with water to the required height. If the head of water is maintained at this level for about an hour, a positive proof is thereby established that the pipes are sound and the joints thoroughly tight and well made. On the other hand, should the water level fall during this period, the cause of the leakage must be ascertained and made good, the drain being afterwards tested until a satisfactory result is achieved.

Fig. 1 is an illustration of Jones's patent expanding screw stopper with centre outlet, to which is attached a water gauge or indicator. By means of this appliance the slightest leakage is at once readily detected.

In addition to the drains, it is also desirable that all iron soil pipes and branches be similarly subjected to the "hydrostatic" test before the fittings are connected thereto. If

an adjustable iron collar must be first secured thereto with screw bolts and nuts, so as to provide a suitable shoulder or projection for the bridle fastening.

Precautions should be taken to prevent air being imprisoned within the branch pipes, so that the whole of the interior may be actually filled with water. The iron plate stoppers should therefore be provided with an air-cock or small screw plug to allow the escape of air whilst filling the pipes.

Figs. 3 and 4 show another form of plate stopper for iron pipes. The plate is fitted with an air-cock and fixed in position by means of three screw bolts attached to the iron collar encircling the barrel of the pipe immediately behind the socket, as indicated in the section.

An illustration of the "Volcano" smoke machine is seen in Fig. 5. It is made of galvanised steel with brass fittings. The smoke may be produced by burning oily rags, cotton waste, or specially prepared cartridges, within the combustion chamber. The machine is attached to the drain stopper as shown, and the annular space (C) surrounding the combustion chamber filled with water to within about 1 in. of the top.

After igniting and placing the smoke material in the combustion chamber, the cover or float (D) is replaced, and large volumes of smoke are generated by gently working the handle (L) attached to the bellows. As the pressure of smoke within the

FIG. 6.

FIG. 8.

plumbing system. The fault must accordingly be located and afterwards made good.

Several devices have also been introduced for the purpose of providing a simple and portable form of drain test by means of other strongly-smelling compounds. Fig. 7 shows a small apparatus of this description, known as "Banner's pocket drain explorer." It consists of a grooved wooden ball, about 2½ inches in diameter, and containing a spiral spring. A chemical possessing a powerful and penetrating odour is contained within a hermetically sealed tube of thin glass (see Fig. 8) about 2 in. long. The method of applying the test is as follows, viz.:—The spring inside the ball is compressed by means of a short lever, and held in this position by passing the end of the lever through the eye or slot shown in the hinged clip to which the cord is attached. One of the small glass tubes or drain grenades is then placed under the staples of the drain explorer, and secured with an india-rubber band. The "explorer" being now charged, the end of the attached cord is securely held whilst the wooden ball and grenade are washed through the gully or closet trap by means of half a pail of hot water. On giving the cord a slight jerk the lever is released, so that the compressed spring forces it violently against the glass grenade, breaking it to pieces, whilst the volatile and pungent substance permeates the

drain. Before applying the test, all openings to the drain must be previously stopped.

Grenades containing either peppermint, assafetida, or other subtle and strongly smelling materials may also be obtained. Another form of drain testing appliance is seen in Fig. 9. The wooden case (C) contains a glass tube filled with chemicals, the contents being sealed by an elastic rubber band (D), secured by a paper fastening (F) and brass ring (G), to which a cord (E) is attached.

Fig. 9.

Fig. 10.

After securing the end of the cord the fully charged grenade is flushed through the trap and into the drain with a quantity of hot water. Immediately afterwards the elastic rubber band (D) is released, owing to the paper fastening becoming moistened and weakened. The contents of the tube are then discharged into the drain as indicated in Fig. 10. At the conclusion of the test (which lasts about fifteen or twenty minutes) the empty case is withdrawn.

"Smoke cases" also provide a simple and portable test for drainage work. These consist of a tube of stout paper, with a fuse at one end and filled with a strongly smelling smoke-producing composition. After lighting the fuse, the smoke case is at once inserted in the drain to be tested, and the end temporarily closed, so that the volumes of smoke emitted from the ignited cartridge are distributed throughout the length of the drain. Smoke issuing from any point on the drainage system, or the presence of the peculiar smell of the smoke cartridge affords evidence of some serious defect, and must be traced to its source. The smoke cases will burn for about fifteen minutes, and should be so arranged that when placed within the drain, the cartridge is supported above the invert, clear of any liquid sewage at the bottom of the drain pipe.

**Proposed Street Improvements at Halifax.**—With a view to improvements in the Lower Skircoat district, the Halifax Corporation have purchased from Mr. Ingram Fuller Godfrey 17,000yds. of land in Dudwell Lane, at the price of 3s. per yard. For the new bridge about to be erected at Godley, the tender of Messrs. Peirson and Co., of St. Dunstan Hill, London, E.C., for providing spring girders, floor-plates, and parapets, for the sum of £3,089 18s. 9d., has been accepted.

**Noisy Building Operations.**—The case of *Ennis v. Brown* was heard in the Chancery Court, at Manchester, recently, before Vice-Chancellor Hall. The plaintiff, Francis Ennis, is the occupier of a house in Church Street, Barrow, and the defendant, Thomas Brown, a contractor, is erecting a building on an adjoining plot of land. The plaintiff alleged that the defendant was carrying on the building operations with unnecessary noise and violence, and was damaging the wall of his house, and his counsel asked for an interim injunction to restrain the defendant from doing so.—The defence was that the contractor had bought the party-wall, and could not build without making a noise and knocking the wall.—The Vice-Chancellor said the plaintiff seemed to be suffering from too highly strung nerves.—Plaintiff's counsel said it was hardly a case of over-nervousness when bricks came tumbling into his client's dining-room.—Ultimately the motion was adjourned, the defendant giving an undertaking not to knock holes in the plaintiff's house, and to conduct his building operations in the usual way.

## Builders' Notes.

**The Endowed Schools, Watford.** are being warmed and ventilated by means of Shorland's Patent Manchester Grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Metal Workers' Dinner.**—The men employed at the Portland Metal Works (Thos. Elsley, Limited) dined last Saturday at The Cambridge Hotel, Southsea, by the invitation of Mr. Thomas Elsley. About 150 assembled under the presidency of Mr. John Chamberlin.

**Erith Engine Sheds.**—Messrs Mellowes and Co., of Sheffield, and 28, Victoria Street, S.W., have recently completed the glazing of the Whitehall Engine Sheds, at Erith, for the South Eastern Railway Co., on their patent Eclipse imperishable system of roof glazing.

**A Plasterer's Claim for Compensation.**—A case was heard by Judge Waddy, Q.C., at the Sheffield County Court on June 30, in which Messrs. Longden and Sons, contractors, Sheffield, were sued by William David Dewar, plasterer, 113, Princess Street, Sheffield, under the Workmen's Compensation Act, for £4. Mr. L. J. Clegg was for the plaintiff, and Mr. Neal represented the defendants. Dewar was engaged on the plastering work at Walsh's new premises, in High Street, and on the 11th January had been working on the first floor. At eight o'clock, when it was dark, he was leaving his employment, and while descending an unfinished staircase fell into the basement. He had a rib broken, and was taken to the Royal Hospital, where his injury was attended to. For the defence, it was contended that the accident was the result of plaintiff's own action. A ladder was provided for the workmen to leave the building, and Dewar had no right to use the uncompleted staircase. A barricade was placed at the top of the stairs to prevent men leaving by that way, but plaintiff got either under or over this barricade, and went down the stairs, and in so doing he acted contrary to orders. Mr. Neal added that even if the plaintiff could recover, his wages only justified him in suing for £2 18s. His Honour visited the premises, and gave judgment for £2 18s. and costs. He, however, found that Dewar had been forbidden to use the staircase from which he fell.

**Building Accidents in Glasgow.**—By the partial collapse of a building in Glasgow on the 29th ult. six men were seriously injured. For some time past a number of buildings on the south side of the city have been in course of demolition consequent upon the widening of the Glasgow and South-Western Railway line. One of these is Hutchesontown Parish Church, situated at the corner of Greenhill Street and Hospital Street, and it was there the accident occurred. About half-past eleven o'clock six men were engaged on the roof of the church, levering a joist as a preliminary to bringing the roof down, when the joist unexpectedly came away, with the result that the roof collapsed and the men were precipitated to the ground. Four of them were so seriously injured that they had to be removed to the Royal Infirmary in the ambulance waggon. The foreman and another man, being less seriously injured, were removed to their homes. Three workmen who were engaged on the ground escaped with a few scratches. The collapse reduced the interior of the church to ruins. Messrs. Archibald Stewart and Company, Maxwell Road, are the contractors for the work. Considerable alarm was caused in East John Street in the afternoon of the same day by the gable of a three-storey building falling out. The block adjoins the site of the public baths about to be erected, and the digging of the foundations, followed by Wednesday's heavy rain, had weakened the gable. Fortunately, the state of affairs had been observed, and the occupants warned to clear out of their houses. This they did, so that life was not endangered, and the damage to property was comparatively small.

## Masters and Men.

**Long Eaton Builders' Labourers** have struck for an advance of  $\frac{1}{2}$ d. per hour.

**The Edinburgh and Leith Joiners** strike is at an end, the masters having conceded to the operatives' demand, which was for an advance of  $\frac{1}{2}$ d. per hour.

**The Plumbers of Oldham** have gone on strike for an advance of  $\frac{1}{2}$ d. per hour, and certain alterations of working rules relating to overtime pay commencing at six o'clock instead of eight o'clock.

**Associated Carpenters and Joiners' Society.**—Delegates from the various branches of the Associated Carpenters and Joiners' Society in Great Britain and Ireland have been meeting in Edinburgh to consider amendments on the existing rules of the Society, and the delegates held a dinner in the Empire Café, South Bridge—Mr. Alex. Stark presiding.

**Paisley Masons** struck work last week owing to a dispute with the masters regarding a by-law. An agreement existed between the masters and men to the effect that the employers should not employ more than six apprentices. At the expiration of that agreement some days ago, the masters wished an alteration which would give them power to employ eight apprentices at the least. This the men resented.

**The Joiners' Strike at Newcastle.**—The Master Builders' Federation of the North of England met last Thursday week to consider the situation. At the close of the meeting the general feeling was that the question at issue should be referred to arbitration, or that the wages should continue unchanged for the ensuing three years on the condition that the demand for an advance from 9 $\frac{1}{2}$ d. to 10d. per hour be withdrawn. The reply of the joiners to the masters' offer of a fixed rate of wages at 9 $\frac{1}{2}$ d. per hour was read. In their reply they refuse to accept the offer. A resolution that the master builders decline to grant the  $\frac{1}{2}$ d. per hour advance was unanimously passed.

**The Building Trade Dispute.**—An important meeting of the Executive Committee of the National Association of Master Builders of Great Britain and Ireland was held last Thursday at Manchester to discuss the position of labour questions in the building industry. The employers complain that the members of the National Association of Operative Plasterers do not, in a number of districts, act in accordance with the terms of settlement of the plasterers' dispute drawn up at the recent conference in London. A resolution was passed which stated that the meeting was of opinion that the operative plasterers in a number of towns had violated the mutual agreement made, and that the letter from the secretary of the National Association of Operative Plasterers, endeavouring to justify the conduct of the members, was most unsatisfactory. The meeting desired an interview at the earliest date to clear away all misunderstanding. Another resolution was prepared, in which it was pointed out that, failing an agreement at this requested interview or joint-conference with the operative plasterers, there would be no alternative before the National Association but the declaration of a general lock-out of one-fourth of the members of all branches of the building trade. Copies of the proposed basis of settlement of the difficulties in the building trade, which was a fortnight ago drawn up by the representatives of the several Trade Unions and submitted to the National Association of Master Builders, were before the meeting, but nothing with regard to a joint general conference was resolved on.

## Surveying and Sanitary Notes.

**Wood Paving at Stratford.**—The West Ham Town Council have resolved to substitute wood paving for stone pitching in the principal roads at Stratford, notwithstanding that the Surveyor estimated wood to cost £63,422 and stone £45,862.

**Jarrahdale Jarrah.**—The Lingard, with 975 loads, and the Hans Wagner, with 818 loads of Jarrahdale Jarrah on board, have arrived in London to the order of the Agent for the Jarrahdale Jarrah Forests and Railways Limited, 1, Fenchurch Avenue, E.C.

**Sewage of Colchester.**—A report has been submitted to the Colchester Town Council by the Sub-Committee appointed by the Roads and Drainage Committee on the question of the drainage of sewage and treatment by the septic tank system, invented by Mr. Donald Cameron, the City Surveyor of Exeter. The Committee have inspected the works at Exeter, and recommend that the Council authorise them to obtain further particulars, with plans and estimates, with a view to the adoption of the system for the borough.

**London Improvements.**—At last week's meeting of the London County Council the discussion on the proposal of the Improvements Committee to embank the Thames from Victoria Tower Gardens to Lambeth Bridge, to widen Millbank Street, and to lay out as a garden the land between the river and Millbank Street, was resumed. After some discussion the recommendation of the committee to proceed with the scheme was approved. The Improvements Committee next recommended that, subject to a contribution from the vestry of Hackney, of one-fourth of the net cost of the improvement, such contribution not to exceed £125,000, and subject to the vestry giving their consent to the doubling of the tramway line throughout the portion of the road proposed to be widened, the Council should apply to Parliament in the next Session for powers to widen Mare Street, Hackney, to 70ft. between the North London Railway and the Triangle. The net cost of this scheme was £577,000. The recommendation was agreed to; and it was also decided to seek powers to widen Goswell Road between Upper Ashby Street and Great Sutton Street, at the cost of £196,000, the vestries of St. Luke and Clerkenwell contributing £20,000. Other recommendations adopted were for the widening of Nine Elms Lane at a net cost of £136,400, the Battersea Vestry contributing £15,000; for the widening of Camberwell New Road between Warner Street and Camberwell Green at a net cost of £52,000, the vestry of Camberwell contributing £5,000; and for a small widening of the Kentish Town Road. It was also decided to contribute £52,750 towards the widening by the City Corporation of Mansell Street and Middlesex Street.

**Bebington Sewage.**—At a meeting of the Lower Bebington District Council last week, a letter was considered which had been received from the Board of Trade respecting the application of the council to construct an outfall sewer on the shore near Bromborough Pool, stating that the Board were not prepared to accede to the application unless satisfactory provision was made for preventing or limiting the discharge of sewage during the period of flood tide. The board also enclosed a report of Captain the Hon. F. C. P. Vereker, R.N., on a conference held at Bebington on June 6th. Captain Vereker reported that at the conference the application was opposed by the Manchester Ship Canal Company. He had inspected the pool into which Port Sunlight was drained, and found it in a very filthy state with decomposing sewage. There was no

question as to the necessity for better sanitary arrangements. He understood that the Local Government Board had consented to the discharge of sewage into the river Mersey without treatment or purification, but the Bebington sewage entered the river at a point where the conditions tended to cause accretions between Bromborough and the canal. The Canal Company and the Mersey Conservancy drew the attention of the Board of Trade to that. If the siltage could be prevented, the objection would be largely, if not entirely removed, and, as it was largely a question of expense, the difficulty should not be insurmountable. Captain Vereker concluded by saying that the sanitary condition of the whole Mersey estuary was very unsatisfactory, forming a receptacle for the entire untreated sewage of a thickly-populated district, and that state of affairs must lead to siltage and accretion on the shores and banks of the Mersey. The District Council, while protesting against the view taken by the Board of Trade, have asked Messrs. Beloe and Priest to prepare plans of a scheme which will best meet the requirements of the Board.

## Engineering Notes.

**The Committee on the Brighton Marine Palace and Pier Bill** have issued a report stating that the bill does not authorise the construction of any new works, but the object is to extend the periods limited by former Acts with respect to the completion of the undertaking and to authorise the construction of a tramway on the pier. The committee have amended the bill by making the maximum charge 3d. instead of 4d. for the return journey on the intended railway.

**Electric Lighting for Wigan.**—A short time ago the Wigan Corporation applied to the Local Government Board for permission to borrow £90,000 for electric lighting purposes. At an inquiry held into the application it was stated that sufficient promises had been received from intending consumers of electricity to ensure a yearly profit of £5,000. Mr. Allen, solicitor, opposed the application on the ground that the proposed generating house would create a nuisance. Evidence was afterwards given by Mr. Bishop, the Wigan electrical engineer.

**The Iron and Steel Institute.**—The autumn meeting of this Institute will be held at Manchester in the Town Hall from August 15th to 18th. On Tuesday, the 15th, the members of the Institute are to inspect the Lancashire and Yorkshire Railway Company's locomotive works at Horwich, an optional visit being arranged to the coke ovens of the Barrow Steel Company and the Wharfedale Silkstone Collieries, both of which are in the vicinity of Barnsley. A trip on the Manchester Ship Canal is arranged for the next day, and on Thursday the machine and iron works of Platt Brothers at Oldham and the Pine Company's cotton mills in the same town are to be open for inspection. The Lord Mayor of Manchester and the Lady Mayoress will entertain the members at a reception in the Town Hall on the Tuesday, and a special dramatic performance is being organised at the Theatre Royal for the Wednesday evening. For those to whom theatrical entertainments have no charms there is provided a reception and afternoon tea at the Peel Park Art Gallery Museum by the Mayor and Mayoress of Salford on Thursday, while for those of a more Bohemian turn of mind there is a smoking concert at the Hulme Town Hall on the same evening. A specially attractive feature is announced for Friday, the concluding day of the meeting, when the Duke of Devonshire will entertain some of the members at Chatsworth. Those who are not invited to this visit will have an excursion to Haddon Hall and Rowsley, where the local Reception Committee will entertain them.

## Trade and Craft.

### A STONE PRESERVATIVE.

It is easy to understand why a building which stands on wet ground, or in a damp, marshy country, exposed to heavy rains, is damp; but it is less easily understood why a building situated in an apparently dry place and climate is damp. The reason is that there is a large amount of moisture even in what is thought to be dry air, and all kinds of stone, brick, and other building materials possess the power of absorbing moisture from the atmosphere, due to their porous character. Thus it is possible for a wall, built of absorbent materials, to be always damp, even in an atmosphere which seems to be dry. As Colonel Szerelmey explains in his book on "The Cause and Cure of Decay in Masonry," the proportion of water held in solution in the air changes incessantly with the various changes of temperature. The balance of the attraction for water between absorbed materials and the atmosphere varies unceasingly, and moisture is continually passing in and out of every porous substance such as stone. This constant flow of moisture rubs against the particles of stone, slowly loosening them and disintegrating the mass. This being the case, there is only one way to cure a damp wall, and that is by a waterproof layer interposed between the wall and the source of damp to prevent the water from entering the brick or stone. Col. Szerelmey, having found out what was necessary to prevent the damp from getting to the wall, introduced a liquid which had the desired effect, but not before many devices and inventions had been brought forward to cure decay and avoid dampness in porous substances. Szerelmey's stone liquid has outdistanced all other remedies, and has withstood that hardest of tests—the test of time.

At the invitation of Messrs. N. C. Szerelmey and Co., of Rotherhithe New Road, London S.E., our representative visited Wren's Gothic Church, St. Mary, Aldermanbury, in Queen Victoria Street, and there he saw the manner in which the church was being protected against dampness by means of this firm's liquid. When our representative arrived at the church he found that the lower portion had already been treated, and the workmen were applying the liquid to the masonry in the roof. In treating the stonework all scales, and everything which had perished, had been cleared away by means of a steel wire brush. The liquid was then applied with an ordinary brush. About three coats complete the treatment. The building has been erected with Bath and Portland stones and fine sandstone. The stone of the building which had not been treated with Szerelmey's liquid absorbed water like blotting paper does.

The tower of the church is in an excellent condition, but is being coated with the liquid as far as the first lights. The colour of the composition is that of stone when newly worked, and the appearance of the stone is unaltered when treated. There is no doubt that owing to the fact that it is able to endure any amount of heat or cold, is unabsorbent of water, and resists the strongest acids without causing any disintegration, it is one of the best preservative fluids manufactured.

**A New Drill Hall at Musselburgh, N.B.**, for the G Company 6th V.B.R.S. has just been opened. This Volunteer Drill Hall and Home is situated in New Street, Fisherrow, and has been constructed from plans drawn by Mr. Constable, architect, who, along with Mr. Richardson, town clerk, gave his services in connection with the work gratis. The building is not pretentious in appearance, but is commodious, and completely fitted up with orderly, armoury, recreation, and store-rooms, which are situated in the part of the structure facing the street. Behind this is the drill hall, a large and spacious room, lighted from the roof, 61ft. by 34ft., which is capable of seating 500 people comfortably. The hall has cost over £1,000.

# A DICTIONARY ADDED TO THE LIBRARY OF REFERENCE

ISSUED BY *The Times*

THE annual production of books worth reading is quite as large in England as in any other country; the serious reviews are not altogether lost to sight in the flood of cheap magazines, and our newspapers devote more space to contemporary history and less space to tittle-tattle than do the newspapers published in some parts of the world. So constant a supply of valid mental food must inevitably enrich the mind of the general reader, if it is properly digested. And since there is a steady demand for standard works of reference, it is fair to assume that the British reader takes the trouble to think about what he reads. The unintelligent type of reader is certainly not over fond of encyclopædias and dictionaries, so that the sale of such works affords a very fair test of the energy or indolence of our assimilation.

£350,000

It is known that over eighteen thousand copies of the *ENCYCLOPEDIA BRITANNICA* were sold in the United Kingdom during the year which ended last Lady-day, a sale representing an investment, by the public, of considerably more than £350,000 in this one work of reference. Within the few weeks which have elapsed since *THE TIMES* announced its issue of the *CENTURY DICTIONARY*, more than fifteen hundred copies of that work have been purchased. So keen a demand for works of reference certainly points to the existence of a large class of thoughtful readers, and shows, too, that a good many of us pursue, almost unconsciously, a continued course of secondary education, making headway without any sense of effort. The most cursory examination of such a work as the *CENTURY DICTIONARY* is sufficient to prove that it must exert a very real influence for good wherever it is habitually used.

## A WORD-BOOK AND FACT-BOOK.

At once a word-book and a fact-book, it serves the double purpose of guiding the reader to the accurate use of words and the swift apprehension of facts. Unlike the *ENCYCLOPEDIA BRITANNICA*, it deals with isolated facts rather than with facts in groups. Of these two methods of presenting information, each possesses its characteristic advantages. When one desires to have all that there is to learn about any given branch of knowledge, the *ENCYCLOPEDIA BRITANNICA* is found to be the most exhaustive, the most readable, and the most authoritative collection of treatises which has ever been formed. When, on the other hand, it is expedient to find one's way as quickly as possible to any single item of information, disregarding the temptation to pause for the consideration of allied subjects, the brief and individualised expositions offered by the *CENTURY DICTIONARY* enable the reader to learn what he wants to learn without encountering extraneous facts. The two works of reference are admirable complements one to the other, from this point of view.

As a book-word the *CENTURY DICTIONARY* is incomparably the best in the world. Its vast vocabulary comprises the English of the past and of the present, the whole body of the language, literary, technical, and colloquial, provincial, colonial, and American, all possible usages, and all possible forms of spelling. Its tables of synonyms, its collection of quotations and the copious illustrations, which add not less to the utility than to the beauty of its pages, are all planned and executed with surpassing skill. Its eight volumes—7,000 pages in all—contain 500,000 definitions, 300,000 quotations, and 7,500 illustrations, a wealth of detail which no other dictionary has as yet approached.

**SPECIMEN PAGES.**—A richly illustrated pamphlet containing specimen pages from *THE CENTURY DICTIONARY* may be had gratis and post free, upon application to the Manager of *THE TIMES*.

## SPECIAL PRICES for the LIMITED EDITION Offered by *The Times*.

**EIGHT SUMPTUOUS VOLUMES.** 12 inches high, 9 inches wide, 2½ inches deep.

<b>HALF MOROCCO BINDING.</b> £13 in Cash, Or 13 Monthly Payments of ONE GUINEA each.	<b>THREE-QUARTER LEVANT BINDING.</b> (Which we recommend.) £15 in Cash, Or 15 Monthly Payments of ONE GUINEA each.	<b>FULL MOROCCO BINDING.</b> £18 in Cash, Or 18 Monthly Payments of ONE GUINEA each.
--	--	--

NOTE.—If the purchaser sends a cheque for the full amount at the cash price shown above, he will effect a saving of One Shilling in the Guinea, and no Order Form need be used. The Form which follows is for the use of purchasers who prefer to make monthly payments.

## MONTHLY PAYMENTS.—ORDER FORM.

THE MANAGER, "THE TIMES," PRINTING HOUSE SQUARE, LONDON, E.C.

I enclose One Guinea. Please send me *THE CENTURY DICTIONARY* bound in

Half Morocco, price 13 Guineas.  
Three-quarter Levant, price 15 Guineas.  
Full Morocco, price 18 Guineas.

Strike out two of these lines.

The balance of which sum I agree to pay you, or any one you appoint, at the rate of One Guinea a month: my next payment upon delivery of the complete 8 volumes, and my succeeding payments on the corresponding day of each month following. Until such payments are complete, I engage that the volumes, not being my property, shall not be disposed of by sale or otherwise. I further agree that if owing to unforeseen circumstances, of which you shall be the judge, the volumes cannot be delivered, the return of the deposit of One Guinea to me shall cancel this agreement.

(Signed).....

(Address).....

The privilege of making monthly payments is accorded to residents in the United Kingdom only.

Please address the package to.....

If books are to be delivered beyond London postal district, the purchaser should add the name of the railway company or shipping agent in London to whom delivery is to be made. Beyond the London postal district, carriage will be at purchaser's cost.

Detached order forms may be obtained from *THE TIMES*. Specimen Volumes may be seen, and orders booked, at Messrs. Chappell & Co.'s, Pianoforte Manufacturers, 50, New Bond Street, or at Messrs. Street & Co.'s, 164, Piccadilly.

## A BARGAIN FOR PROMPT APPLICANTS.

The price at which this marvellous work is offered by *THE TIMES*, is, to book buyers, whose means are not unlimited, a consideration of no little importance.

In pursuance of the policy adopted by *THE TIMES* in its issue of the *ENCYCLOPEDIA BRITANNICA*, a very great reduction in the price is accompanied by the further convenience of the monthly payment system. The *CENTURY DICTIONARY* is supplied by *THE TIMES* at £13, in the Half Morocco Binding, a reduction of 45 per cent. from the regular price. The work in Three-Quarter Levant Binding—recommended alike by its beauty and durability—is £15, and the Full Morocco Binding, adapted to the requirements of connoisseurs, is sold for £18.

## THE MONTHLY PAYMENT SYSTEM.

Under the system of serial payments, the eight volumes, in any of the three styles of binding, will be promptly delivered, all at one time, for a preliminary payment of only one guinea, the purchase to be completed by further monthly payments of one guinea. The price, under these conditions, is, according to the binding, thirteen, fifteen, or eighteen guineas in all—only 5 per cent. more than the price for payment in cash.

This remarkable combination of a very large reduction in price with the most convenient terms of payment is the result of a novel theory of bookselling.

The foundation of all discount prices in the bookselling trade is cash payment, an inconvenience which the purchaser must suffer in order to get the advantage of the discount.

*THE TIMES* dispenses with cash payment, and yet gives a far larger discount than is generally allowed for cash payment.

That is the *NEW THEORY OF BOOKSELLING*. Perhaps it would be more exact to call it a new theory of advertising.

Every early purchaser of a new work of reference is, unconsciously, advertising the book. If he is pleased he expresses his pleasure. If he sees that he has made a good bargain, he tells his friends about it. That is the best advertising in the world. But a sacrifice must be made in order to obtain it.

A limited edition of the new work must be sold at a very low price in order to attract a sufficient number of early purchasers without losing time.

This is the procedure which is now being followed in the case of the *CENTURY DICTIONARY*. As soon as the limited edition has been exhausted, the price will be increased.

When *THE TIMES* first offered the *ENCYCLOPEDIA BRITANNICA*, it was plainly stated that the price would be increased. Yet half the people who bought the *ENCYCLOPEDIA BRITANNICA* waited until they had lost the benefit of the minimum price.

Belated purchasers of the *CENTURY DICTIONARY* will incur a similar loss.

Is it not better to buy the work now?

Only one guinea in cash need be paid at once. The second payment of one guinea is not due until the volumes have been delivered. If the purchaser is leaving home for the summer, a copy of the *CENTURY DICTIONARY* will be reserved for him until he returns, and his second payment will thus be postponed. One guinea must, however, be paid now, in order to secure the benefit of the introductory price.

**FAREBROTHER, ELLIS, EGERTON, BREACH, GALSWORTHY, and CO.** beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, July 13	Thursday, Oct. 12
Thursday, July 20	Thursday, Oct. 26
Thursday, July 27	Thursday, Nov. 16
Thursday, Aug. 3	Thursday, Nov. 23
Thursday, Aug. 10	Thursday, Dec. 7
Thursday, Sept. 21	Thursday, Dec. 14

Messrs. **FAREBROTHER, ELLIS, and CO.** publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 23, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By order of the Executors of the late owner.

The Valuable FREEHOLD PROPERTY known as "Royal Dockyard Wharf," Lower Woolwich-road, S.E., together with the Fixed Plant and Machinery and Goodwill of the old-established TIMBER and BUILDERS' MERCHANT'S BUSINESS, as a going concern, and the LEASE of the adjacent Waterside PREMISES, known as "Mast Pond Wharf," will be offered for SALE by Public AUCTION in One Lot by **MESSRS. BRADSHAW, BROWN, and CO.** at the MART, Tokenhouse-yard, E.C., on **TUESDAY, JULY 25th, 1899,** at One o'clock precisely.

The Freehold Property (built by the British Government) has a granite embankment to the River Thames of about 400ft.; and a frontage of about 442ft. to Lower Woolwich-road, with three cartway entrances therefrom, and comprises an area of about 2½ acres. Two granite-paved shipways, one 235ft. long, 53ft. wide.

"Mast Pond Wharf" has a frontage to the river of about 100ft., and contains an area of about three-quarters of an acre.

The Lease has an unexpired term of about seven years, at a rental of £150 per annum.

**JOHN BARLETT, Esq., Solicitor, 26, Bush-lane, E.C.;** Auctioneers' Offices, Billiter-square Buildings, E.C., and Millwall, E.

**SPRING-GROVE ESTATE, ISLEWORTH, MIDDLESEX** (overlooking Osterley Park, the seat of Earl Jersey).—126 acres of FREEHOLD BUILDING LAND.

**MESSRS. GREEN & SON** beg to announce that, the above PROPERTY not having been sold at the recent Auction, they are prepared to enter into negotiations for same as a whole, free of restrictions, or sub-divided as follows: 53 acres adjoining Osterley Park Station; 48 acres adjoining Osterley Park Station & 6½ acres with building frontages of 2860ft.; 7½ acres with building frontages of 2917ft.; 9½ acres with building frontages of 1317ft. Portions of the property would be let at ground rents to be arranged.

Particulars, plans, &c., of Messrs. **GREEN and SON, Auctioneers and Surveyors, 28 and 29, St. Swithin's-lane, London, E.C.**

**CITY OF LONDON.**

City Improvements.—By order of the Corporation.

To Brewers, Licensed Victuallers, Restaurateurs, and others. Offering an opportunity of securing one of the finest sites for licensed premises.

In the heart of the shipping, wine, Colonial, and corn trade centres.

The valuable Free LEASE of the important corner Building Site, together with the License thereto attached, now occupied by fully-licensed premises, the Mercantile, and the adjoining property known as 126, Fenchurch-street, E.C.

Having a frontage of about 36ft. 5in. o Fenchurch-street, and about 43ft. 2in. to Fen-court, which is now being widened, and will form an important thoroughfare, with an enormous pedestrian traffic, the whole covering an area of about 1,374 square feet. A free lease for sixty-five years will be granted at the moderate ground rent of £300 per annum.

**MESSRS. DOUGLAS YOUNG and CO.** will **SELL** the above by AUCTION, at the Mart, E.C., on **WEDNESDAY, JULY 19th, 1899,** at ONE o'clock precisely.

Plans, particulars, and conditions of sale may be obtained of the **COMPTROLLER or the CITY ENGINEER, Guildhall, E.C.;** or of the **AUCTIONEERS, No. 51, Coleman-street, E.C.;** 313, Clapham-road, S.W.; and Ilford, E. 1

**WALTHAMSTOW, Essex.**—83 Plots of exceedingly valuable FREEHOLD BUILDING LAND, free from tithe and land tax, being the remaining portion of the Rectory Manor Estate, having important frontages to Church-hill and the new roads leading therefrom to Forest-road, within a few minutes' walk of Hestreet Station on the G.E.R., from whence there is an excellent train service during the day and half-hourly throughout the night. Fully ripe and immediately available for the erection of private residences, and affording an excellent opportunity for the creation of ground rents. Also two Paddock Sites in Aubrey-road.—For SALE by AUCTION, on behalf of

**THE BRITISH LAND COMPANY, LIMITED,** at the **CHEQUERS, High-street, Walthamstow,** on **THURSDAY, JULY 13th,** at SIX for SEVEN o'clock in the evening. Free conveyances. Purchase-money payable by a deposit of 10 per cent., and the balance by easy instalments extending over nine years.

FRANK MILES DAY AND BROTHER  
ARCHITECTS  
925 CHESTNUT STREET, PHILADA.  
F. M. DAY H. KENT DAY

March 1, 1899.

Mr. George Wragge,  
Salford,  
Manchester, England.

Dear Sir:

Noting your full page advertisement in the "Specification" this morning reminds us that we have been intending for some time to write to you to tell you how admirably your casements in Mr. Newbold's house behaved during the recent blizzard. The storm was one of unprecedented severity, the snow being thirty inches on a level and it was accompanied by winds of great velocity. The snow being very fine and dry, found its way in generally through the slightest cranny. The blizzard was promptly followed by a rapid thaw that set everything afloat and caused quite serious damage through leaks. The conditions were probably the most trying that we remember during the course of our practice. Your casement frames perfectly resisted every force of that storm and the subsequent thaw. No snow whatever entered Mr. Newbold's house either through the doors or windows, nor did any water get in when the thaw came.

This, we think, shows not only the excellence of the goods of your manufacture but the fact that they were well installed by the men under our direction. We are glad to be able to write you this, not only on our own account, but because the Owner of the house particularly wished us to express to you his satisfaction with your work.

Yours very truly,

*Frank Miles Day & Bro.*

The above *UNSOLICITED* Testimonial refers to a very important order for upwards of 250 BRONZE CASEMENTS supplied to Mr. Newbold's Mansion, Philada. U.S.A. The sections used were Nos. 20, 22 and 24, illustrated in our NEW CATALOGUE, pages Nos. 10, 14 and 18 respectively.

## An Architectural Causerie.

### London Commons and Their Destiny.

THE growth of London has attracted serious attention from time to time, ever since the days of Queen Elizabeth, an age which the poets, more happily than they knew when they penned the epithet, have termed "spacious." When "good Queen Bess" ruled, the population of London was comprised within what we now call "the City," a place now depopulated at night. London, all told, comprised then perhaps 90,000 persons. Outside the City there was the village of Charing, and Westminster stood remote in the country. The citizens were content to live in the City, and for ten miles round the metropolis stretched lonely heaths, which produced nothing but footpads and highway robbers. So much towards a picture of London's surroundings 300 years ago. Yet even then the Government was alarmed at the growth of the metropolis, and framed enactments restricting building operations. We need not point out that those laws were futile. So much is self-evident. From that period a steady and cumulative growth has taken place, redoubled, of course, at the dawning of the railway era. Relentlessly spreading, dozens of villages have been overwhelmed and added to the interminable streets, and in a ten-mile radius from the Royal Exchange but little land is left still unbuilt on. It has, however, been left to these last few months to witness the beginning of the final surrounding of London's great commons by a continuous fringe of houses. Over a year ago the village of Barnes was cut up by the builder, and streets of villas built fringing the picturesque common of Barnes. Already the hillside common of Streatham had been thus surrounded by the cutting up of large estates bordering upon it. Now the still greater Wimbledon Common, hitherto more rural than any other, is in danger of losing its especially countrified character since the sale of Wimbledon Park at the end of June. The extensive estate of Wimbledon Park, the seat of the late Sir Henry Peek, ran beside the Common for a long distance along the road between Putney and Wimbledon town, and was inclosed within an inoffensive, old, red brick wall. The whole of this estate is now to be laid out in building plots, so that within a year or so the Common will become nearly as much inclosed as any London park. This, indeed, would appear to be the destiny, within our own time, of all the commons comprised in the ten-mile circuit. It is alike pitiful and inevitable that, with this hemming-

in of open spaces by great populations, there arises a call for and need of the government of all such places, with the result that their character as wild, natural common-lands presently disappears, and park-like roads and formal plantations take its place. It has been left to the present time to see money in the fact of a house facing an open space, and, now that this is perceived, it will not be long before estates situated on the borders of our commons all change hands at high prices for building long rows of "villas" upon. Sheen Common is another instance of this movement. At present it remains rural, and sur-

meet anyone, except just within the Star and Garter gates, at the Richmond side. Now groups are under every tree, and the deer, once so timid of the casual stranger in these wilds that they would fly at a distant sight of him, will now pluck up sufficient assurance to feed from the hand of the visitor. Meanwhile, Surbiton, Kingston, and Richmond are growing up to the very walls of the park, and at no very distant time we shall doubtless come to hear of an agitation for the destruction of those blank walls and their replacement by open iron railings, just as we have already heard of a movement for a similar railing to that inclosing Hyde Park to take

DRAWN BY F. HAMILTON JACKSON, R.B.A. (See p. 353).

rounded by meadows where the cattle graze; but those meadows have their price, and—in the modern slang term—are "ripe for building," so that even now the usual boards are going up, announcing "eligible residences," and the Common will become, in effect, a park for the enjoyment of those whose houses will look upon it. How quickly suburban London has come up with these once secluded spots is well within the knowledge of those still young. Within the present writer's own recollection, for instance, Richmond Park was a solitude in which it was a strange and unaccountable thing to

the place of the high wall bounding Kew Gardens, besides the road from Kew to Richmond.  
C. G. H.

**Holiday Sketching.** WHILE to all brain workers the annual summer holiday comes as a great boon, to the architect it comes also as an opportunity for refreshing study, free from the confinement of the office, and apart from the worries of everyday business life. Men of other callings frequently find their holidays wearisome, especially if they be of any length, for want of an object; the architect, setting out with

sketch block and scale rule, is possessed of this object in his desire to improve his powers of design and his knowledge of his art. And he is the happier man, mentally and physically the better, coming home at the end of his sketching tour as bronzed as his brother who has lounged his time away on sea beaches, and the richer by the portfolio of sketches which he has accumulated. Few things are more pleasant than to sit down under shady trees in one of the many beautiful spots in our beautiful country and sketch with pencil or with brush. Certainly there is some temptation to make slight general sketches of outline and of grouping rather than serious measured drawings, yet even these have a distinct value, especially to one who spends his working life in close company with the drawing board and T-square, and who is consequently apt to design rather for elevation than for mass, and to lose his appreciation of how things will look when

SLIGHT HOLIDAY SKETCH MADE NEAR SOUTH-END IN A POCKET-BOOK MEASURING  $4\frac{1}{2}$  IN. BY  $2\frac{3}{4}$  IN. BY G. A. T. MIDDLETON.

built, unless he occasionally sketches in this way. But presently the more serious work is sure to be undertaken, for there comes the desire to every architect eventually to find out exactly for himself how this or that effect which strikes him as good has been obtained. Even then, unless it be undertaken for some set purpose, there is no necessity for laboriously careful work. In fact, it is somewhat to be deprecated in holiday time, except on the part of the beginner, who, unless he works carefully, would probably make mistakes. By using paper divided into quarter-inch squares by light lines, sufficient accuracy for all practical needs can be secured at once, the work being directly plotted to scale, the leading dimensions figured. System, however, is necessary. There should be first a small scale-measured general plan and skeleton elevation, with reference letters to the details, drawn quarter or half full size at least; and the details should themselves be so arranged as to show at a glance how shafts fit on top of bases, and arch moulds on to capitals. In order that the drawings may be to a large enough scale to be of value, the paper used must be large, too. Nothing under quarter-Imperial size is of much use—a half-Imperial block is better, but it is heavy to carry and to hold. The general perspective sketch, which should never be omitted, may very well be done to a smaller size, a pocket sketch book being frequently large enough, though not to be greatly recommended. Yet it would be a mistake to start on a holiday without the smaller book. It is available for jottings at odd moments, and if employed occasionally for notes which are not architectural, the interest of the book is increased and little harm is done.

G. A. T. M.

## On Reflection.

### Why Did they Laugh?

THE Shambles Committee of the Stockton Corporation offered premiums of £25, £15, and £10 respectively for the best design for a new market hall. Ten designs were received, and—ostensibly, at any rate—the usual precautions to secure anonymity were taken. At a recent meeting of the Corporation the committee (there seems to have been no assessor) recommended that the premiums should be awarded respectively to the plans numbered 7, 9, and 8. When the envelopes containing the winning numbers were opened, a curious thing happened. We quote from the Darlington "Northern Echo": "Some laughter was occasioned when it was found the three successful architects all belonged to the town, though the other competitors came from other such far off places (*sic*) as Leicester and Newcastle." We should like to know the true inwardness of that laughter. Was it merely the innocent mirth of those who take a child-like delight in a curious coincidence? Or was it the chuckle of a gratified patriotism caused by the reflection that three citizens of Stockton had beaten the architects of the "other such far-off places?" We will charitably hope it was one or other of these things, or a mixture of both. But the town councillors of Stockton should remember that unsuccessful competitors, with an extensive and bitter experience, perhaps, of the ways of building committees, may be inclined to give a more sinister interpretation to such ebullitions of merriment. It is advisable—in order to avoid the reproaches of the censorious, if for no other reason—that public authorities before inviting architects to enter a competition should decide whether they really mean to build or not (the Stockton Corporation does not seem to have decided yet), and then engage the services of a competent assessor.

### The Government and Art.

THERE has lately been laid on the table of the House of Commons some correspondence which forms an interesting, if a melancholy, commentary on the way in which the artistic interests of the nation are neglected by Her Majesty's Government. The correspondence in question is between the trustees of the National Portrait Gallery and the Treasury and has reference to three portraits of considerable historical and artistic value which the trustees desired to purchase. It appears that the Marquis of Normanby has offered to sell to the National Portrait Gallery a full length portrait of the Queen, which was painted by Sir David Wilkie and exhibited at the Royal Academy in 1840, a portrait of Charles I. by Daniel Mytens and a portrait of Henrietta Maria, ascribed to Van Dyck. The price of the three pictures together is something over £3,000, a sum which many private collectors would, no doubt, willingly give for three such interesting examples, but which the National Portrait Gallery, with its paltry annual grant of £750 finds altogether prohibitive. Viscount Peel, as chairman of the Board of Trustees, makes a strong appeal to the Treasury for a special grant to allow of the purchase of these pictures, especially in view of the fact that in each of the three cases the National Portrait Gallery is but ill provided with a portrait. The answer of my Lords of the Treasury, stripped of much polite verbiage, resolves itself into a simple refusal to do anything in the matter. Lord Peel returns to the subject in a second letter, in which he expresses, not without warmth, the very deep regret of the trustees at being deprived of the opportunity of securing the fine portrait of the Queen by Sir

David Wilkie. He points out the great increase in the market price of pictures so that an annual grant of £1,500 would now barely suffice for the purchase of the same portraits that could be obtained for £750 twenty years ago. My Lords, however, remained obdurate, pointing out in a final letter that Parliament when assigning to the Portrait Gallery the grant of £750 was acting on the principle that, in acquiring examples, regard must be had to the celebrity of the person represented rather than to the merits of the artist. From which it would seem to follow that the only portraits the trustees of the Portrait Gallery can hope to acquire for the nation are those of inferior artistic value—the leavings of more wealthy collectors. Truly a humiliating state of affairs for the richest nation in the world.

### Labour Troubles in Denmark.

DURING the past two months the little kingdom of Denmark has been in the throes of a labour struggle more severe and critical than any which we have up to the present experienced in England. From the somewhat meagre information regarding the causes and progress of the dispute that has hitherto reached this country it would appear that the employers have taken advantage of a small local dispute to precipitate a general conflict by which they hoped to check the growing power of the workmen's organisations, or, as the men contend, to crush these organisations altogether. Labour is more highly organised in Denmark than in any other country; practically all the workmen are members of trade unions, and all the unions are federated in one strong central body. To meet this powerful organisation, the employers also have formed themselves into a federation. The employers made eight demands of the United Trade Unions Federation, and the rejection of these was followed by a general lock-out, involving all the men engaged in the building, engineering, and allied trades. Seeing that one of the demands was that no permanent employes or foremen should belong to trade unions, the employers can hardly have expected that their terms would be agreed to. The number of men involved in the dispute is stated to be about 40,000, and as there are not more than 80,000 workmen engaged in industrial enterprises throughout the country, it is evident that the struggle is on a relatively colossal scale, and that the suffering and loss to both sides must be very great. Obviously, the wide-spread character of the present dispute is due, to a great extent, to the fact that the contending forces are so highly organised; and therefore it becomes a matter of great importance to employers and employed everywhere to consider whether the strengthening of the organised forces of capital and labour does not increase the danger of industrial conflict. A lock-out or strike involving 50 per cent. of the industrial population of this country would be a calamity almost too horrible to contemplate. The tendency in England is for both employers' and workmen's organisations to form strong federations, after the Danish model, and so increase their fighting strength. On the principle that the increasing deadliness of instruments of war is a strong guarantee of peace, this tendency is welcomed by many. The consequences of a general struggle, it is argued, would be so terrible that men would be unwilling to incur the responsibility of taking any action which might have that result. Unfortunately, the Danish employers do not seem to have been influenced by any such reasonable and humane considerations, and, for ourselves, we cannot regard with complacency the formation of colossal amalgamations either of employers or employed until we have some far more effective machinery for conciliation and arbitration than at present exists.

### No. IX.—BURGOS.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 260, No. CCXXVI.)

THE city of Burgos was the ancient capital of the kings of Castile. It lies among the hilly regions, the Montañas, at a distance of over 200 miles from Madrid, and about 170 from the frontier. From its elevation and the scarcity of trees, it is much exposed to the northerly winds, and its climate has a bad reputation. It is said to be dull, damp and cold, and even in June and July its habitants sometimes think it advisable to "pack up." The saying, "Diez meses de invierno dos de inferno" ("ten months of winter and two of the infernal regions") which is now applied to Madrid in the reverse sense, originated here, and is mentioned as long ago as 1536 in this connection by Navagero. Yet notwithstanding its bad reputation, the town is healthy, and the death rate not very high. It stands on the Arlanzon, and a smaller stream, the Pico, passes through parts of it. There are many fountains, and an abundant supply of water. The city slopes up from the river to the greatest height within the walls, where the castle is situated, and many of the churches are approached by flights of steps in consequence.

The city was founded in the year 884 by Diego Porcelos, and in 959 Count Fernan Gonzalez shook off the yoke of the kingdom of Leon, and became hereditary Conde de Castilla, a dignity which was then equivalent to a kingship. The castle, which was the palace of the early counts, has seen many interesting historical events enacted within its walls. It was here that Fernan Gonzalez brought Garcia, King of Navarre, a prisoner, and confined him within it for thirteen months. Within its walls also was celebrated the bridal of the Cid. Alfonso the Sixth of Leon was taken here, where he was made prisoner by the Cid in the church of Carrion. Here St. Ferdinand received St. Casilda, the daughter of the Moorish King of Toledo, who was converted to Christianity, and it was the birthplace of

Pedro the Cruel. Don Fadrique, son of Enrique II., who was the first Spanish duke, was imprisoned here; and here, again, Edward I. of England espoused Eleanor of Castile. But none of the surroundings of these various occurrences are now to be seen.

The State rooms of the castle were destroyed by a fire in 1736, and the explosion in 1813, during the French invasion, ruined the windows of the cathedral, and made the desolation more complete. It is now a mean building, useless as a fortification, which stands upon a rugged hill strewn with the debris of buildings. Yet this part of the town was once most populous. Below the castle runs the Calle Alta to the Puerta St. Martin, and just within this gate is a cemetery, which occupies a great part of the ancient parish of San Martin, in the church of which the Cid was baptised, the houses of this parish having been razed to the ground by the French. The Calle Alta, being the nearest street to the protecting castle, was the first inhabited when Burgos became a city, and here the aristocracy lived. On the side next to the castle scarcely a house remains, though this destruction is not all the work of the French, for an inscription on the ridiculous monument, which marks the site of the Cid's house, records that it was destroyed in 1771.

The most imposing monument in Burgos, however, is the Cathedral, and it is to this that the attention should first be directed. It is a building for the most part Gothic in style, built in the main in the thirteenth century, but it has many later and most beautiful additions. The foundation stone was laid in 1221 by an Englishman, a certain Bishop Maurice, together with the King, Ferdinand El Santo (who founded it in honour of his marriage with Beatrice, daughter of the Duke of Suabia), and the Infante Antonio de Molina. As with so many other fine cathedrals the name of the original architect is unknown—though plenty of names of those who designed and carried out later additions are recorded. The west front is spoilt by alterations made in the last century, and the "lace-like" towers which are so much praised by the guide-book writers are over elaborated and fussy in appearance. The most striking parts of the exterior are the late Gothic and Renaissance Capilla del Condestable and the Puerta de la Pellegeria, which opens at the base of the celebrated staircase in the north transept, though the doors both of the north and south transepts are fine of their sort. This door derived its name

from a street which once existed here, inhabited by dealers in skins, and is a very beautiful work of the earlier Plateresque style, equalling in its decorative design Italian sculpture of the early Renaissance. The escutcheon of Bishop Fonseca, who found the money for the work, crowns the composition, and also appears in the spandrels. Below this crowning detail the bishop is carved kneeling before the Virgin, behind whom are three angels playing on instruments. Below this again are two subjects, the martyrdom of St. John the Baptist and of St. John the Evangelist. Flanking the door are standing figures in niches, and the ornamental work is of the greatest delicacy and richness. The walls of the Constable's Chapel are enriched with coats of arms and ecclesiastical emblems supported by angels, savages, and lions. The portion enclosing the sacristy is embroidered with beautiful lace-like carving, which marks structural levels, and surrounds the windows, finishing with a beautifully delicate openwork cornice, with turrets at the angles, weighting the flying buttresses which support the lantern vault. The lantern, which rises above the crossing of nave and transepts, is Renaissance in style, and rather later. It is octagonal, with eight turrets, ornamented with statues of saints and virtues, which are crowned with figures of angels holding crosses. The interior of this lantern is supposed to be the gem of the whole edifice, but a remark of Charles V., intended as praise, not unfairly indicates its defect. He said "that it ought to be placed in a case, and not be seen as other ordinary work." Philip II. said that it was rather the work of angels than of men. It was finished in 1567, and was designed and executed by Burgalese artists, though the name of the designer—Felipe de Borgoña—might suggest a foreigner. He lies buried close by. I do not propose to attempt a description of the whole Cathedral, or, indeed, of the town, but simply to note the things which most attracted my eye in it. The two chapels of the "Presentation" and of Santa Ana, one on each side of the nave, contain many beautiful works of various kinds. It will suffice to mention the *retablos* above the principal altars, finely carved and coloured, and the *rejas*, or iron screens, dividing them from the aisles, which are painted and gilded, one being an elaborate work in *Gotico florido*, the last phase of Gothic, which was used in ecclesiastical decorative detail long after Renaissance was the style in universal use for domestic work; and the other,

S. NICOLAS AND PLAZA IN FRONT OF THE CATHEDRAL, BURGOS.

very similar in the essentials of design, but in an early Renaissance dress, with an exceedingly beautiful cresting. The one is a work of 1474, the other of 1519. At the entrance of the Constable's chapel is another very beautiful Renaissance *reja*, the master-work of Cristobal Andino, wrought in 1523. In this the upper part is designed quite differently, and the Gothic tradition of construction is thrown aside. The interior of this chapel is full of delicate and beautiful carving. There are three altars, all of them with exquisitely carved *retablos*, and on the walls are large escutcheons of the Velascos supported by wild men and women. It was erected in 1487 as a burial place for the Velasco family, Hereditary Constables of Castile, and the effigies of the founder, Pedro Hernandez de Velasco, who died in 1492, and of his wife, Dona Mencía Lopez de Mendoza, who died in 1500, lie in front of the high altar. They are worked with a wonderful elaboration of detail which yet does not disturb the general effect, and were sculptured in Italy in 1540. There are fourteen windows filled with painted glass, almost the only glass left unruined by the explosion when the French abandoned the castle in 1813. In the Chapel of the Agony is kept the much venerated *Cristo de Burgos*, a very early crucifix, which is said by Spanish tradition to have been carved by Nicodemus shortly after he with Joseph of Arimathea buried our Lord. It was found floating on the sea inside a box, and after many eventful journeyings and mishaps, was in 1836 deposited in this chapel. It appears to be the work of a sculptor, and not of an amateur, so I fear that the legend must not be implicitly accepted. It is girt with a richly embroidered crinoline, and as in so many of the Spanish crucifixes, real hair has been added, with an unfortunate effect to English eyes. The staircase to the north door is a beautiful specimen of the early plateresque, designed by Diego de Siloe, who carved the marble work, the metal balustrading having been wrought by Cristobal Andino in iron in the most exquisite fashion. It was necessitated by the position of the cathedral on the hill-side, the ground level at the north being high above the floor of the nave, while from the south transept a similar number of steps descends to the plaza del Duque de Vittoria, and the cloisters, which one enters from a finely-carved door in the south transept, have a storey below them. It was found that the draught from the lower door to the higher, across the nave, was so strong that the upper door had to be kept closed, and it has not been opened for more than a hundred years. The *reja* of the transept was wrought by a lay monk named Pedro Martinez, in 1723, a very late date for such a

work; that of the choir is earlier, made in 1602 by G. Bautista de Alma. The *retablo* behind the high altar was put up between the years 1575 and 1593, by the two brothers Rodrigo and Martin de la Haya. It is a crowded series of compositions and is gilded from top to bottom but in its place looks fine and impressive. Behind the high altar the *trasagrario* is enriched with excellent alto relieves representing the Passion of Christ. They are the work of Juan de Borgoña and were wrought in 1540. The cloisters are of the fourteenth century, and contain many tombs with fifteenth century railings and grilles defending them. In the chapter house is an ancient chest which is called "The Coffer of the Cid" and claims to be one of the two chests filled with sand and stones which he left as security for a loan of 600 marks with the Jews, Rachel and Vidas.

Not far away is the church of Santa Gadea, one of the churches of purgation by adjuration, in which the Cid made Alfonso VI. swear that he had no part in the murder of his brother, Don Sancho, at the siege of Zamora. "The gallant Cid, who held a crucifix, made him swear the truth upon an iron lock, a crossbow, and the gospels."

The oath which he dictated was so awful that the king did not venture to take it. "But a knight, a friend of the king, said unto him: 'Swear, and fear nought, brave king, for never was a king perjured, nor a pope excommunicated.'" The king then took the oath, but was filled with anger, and this was the cause of the Cid's banishment. The lock is now affixed to the wall out of reach.

In the church of San Nicolas, close to the Cathedral, is a marvellous *retablo*, or reredos. The whole eastern wall of the church is filled with figures and groups standing in rows under most beautifully worked canopies, coloured but faintly, and partially gilded. The composition is divided into a central portion and two wings, above which, in the tympanum of the arch, is a Christ in glory. Below Him is a Coronation of the Virgin, the figures surrounded by an aureole formed of ranks of angels arranged like the spokes of a wheel. Beneath the feet of the principal figures stands St. Michael, and the corners are filled up with the four Evangelists; St. Luke is painting at an easel. Below these figures is a highly ornamented arch, in the centre of which is a large figure of St. Nicholas, with scenes from his life, arranged in three stages, divided by canopies exquisitely worked. The wings at each side of these subjects are filled with small groups of angels and subjects from the life of Christ, under equally beautiful canopies; and below them, on each side of the altar, is a tomb of the Polancos, who gave the *retablo* some time between 1412 and 1503. It is such a work as is certainly not to be seen outside of Spain, and very rarely within that country. The church also contains a good iron pulpit, and the door has some good carving in low relief on its panels. Proceeding along the Calle Alta, many ancient iron knockers of quaint shapes may be seen, though the houses are now inhabited by the poor, and not as in days gone by, by the aristocracy; and soon the arch of Fernan Gonzalez is reached, erected by Philip II. to the memory of that hero. This arch now stands by itself by the side of the road surrounded by desolation. The gate of San Martin just beyond is a picturesque erection of brick and stone with Moorish horseshoe arches. The cemetery gateway is close by, bearing over it an impressive couplet, the meaning of which is—

Short is life and rapidly fleeting,  
Woe to thee, O, man, if thou wastest it.

Below in the suburb was a stork's nest on the top of a church belfry, the male bird stood on guard, while the female's head just appeared above the edge of the nest. Returning below

CLOISTERS IN THE CATHEDRAL, BURGOS.

the castle the church of San Estéban appears, with its rich façade. It has some interesting tombs within and very delicate architectural carving. A little further is to be seen another Moorish gateway, built mainly of brick, outside of which is a roadside cross which groups well with the old walls, the roads, and the lower town. Passing down outside the walls the town may be re-entered by the Puerta San Francisco, not far from the church of San Gil, which contains some fine Gothic tombs, two magnificently carved and grouped retablos, gilded and coloured inside chapels, and an iron pulpit of elegant design. From this church the way is short to the Plaza del Huerto del Rey, which has in its centre a fountain with a pillar supporting a figure seated on a gilded dolphin. A vegetable and fruit market may be seen in progress here by those who are afoot early enough, providing subjects for pencil and brush. In the next street is a picturesque

piece of light and shade. A low archway conducts to an inn under a colonnade, used by the country folk—a most uninviting and unlikely entrance to our English ideas! Looking the other way there is another plaza sloping up the hill, at the corner of which is an ancient palace, now turned into shops and workshops, the beautifully carved doorways seeming woefully out of place and forlorn in such company.

On the other side of the river are other houses which have fallen on evil days, such as the Casa de Miranda, once a nobleman's house with a beautiful patio and fine ceilings to the rooms, now occupied as tenements by working people, who live and work in portions of the state apartments, for the large rooms have been divided by roughly-built walls, and the spaces between the colonnade on the first floor filled up to provide more rooms. Another fine house was the Casa del Cordon, a building of the end of the fifteenth century. It was the

house of the constable who built the chapel in the cathedral. The doorway is surrounded by a heavily carved knotted rope, the cordon or rope of the Teutonic order which links the arms of the houses of Velasco, Mendoza, and Figuera with those of royalty. The interior was gutted by the French, but some remains of its former architectural beauty may still be seen.

(To be continued.)

**A Bootle Joiner's Fatal Fall.**—Patrick T. Kavanagh, joiner, while engaged last week in lifting a plank on the roof of some newly-erected dwelling-houses in Balliol Road, Bootle, slipped and fell from the parapet of the building to the ground, a distance of about 40ft. He was taken to the hospital in an unconscious condition, and died shortly afterwards.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### EXAMINATIONS FOR SURVEYORS.

To the Editor of THE BUILDERS' JOURNAL.

DEVIZES.

DEAR SIR,—Will you kindly inform me through the columns of your valuable journal, whether there are any institutions in existence where Quantity Surveyors can be examined as to their practical knowledge of taking out Bills of Quantities. SURVEYOR.

Such examinations are conducted by the Surveyors' Institution. Particulars can be obtained from the Secretary, at Savoy Street, Victoria Embankment, W.C.

### INTERSECTION OF ROOFS.

To the Editor of THE BUILDERS' JOURNAL.

HAMPSTEAD, N.W.

SIR,—I should be obliged if you would kindly inform me the best method of finding the lines of intersection between roofs of different pitches.—Yours, &c., H. W. P.

The simplest method is that shown in the accompanying diagrams. First draw skeleton sections of the two roofs, intersecting them

SECTIONS.

SECTION OF HIP.

METHOD OF FINDING LINES OF INTERSECTION BETWEEN ROOFS OF DIFFERENT PITCHES.

by a horizontal line at the uniform height K, giving plan lengths of X and Y. Make a plan from these two plan lengths as shown, giving plan length of hip Z. Then make a section along the hip with plan lengths of Z and the uniform height K. Valleys can be similarly treated, and so can roofs which meet at other angles than right angles. G. A. T. M.

### IRON AND GLASS ROOF TO COACH-HOUSE.

To the Editor of THE BUILDERS' JOURNAL.

CROUCH END.

SIR,—About two years since plans were submitted to the local authorities and passed by them for the erection of some stables and coach-houses. Each building consisted of a two-stall stable and small coach-house at side, with 10ft. of yard in front of same fronting on to a roadway 20ft. wide. A friend of mine who bought two of these stables now wishes to convert one of the buildings and use it wholly as a coach-house, and has applied to the local authorities here to allow him to cover in the 10ft. of yard in front with an iron and glass roof, open at front, for the purpose of washing carriages. This the local authorities refused to allow him to do, as they say it does not comply with their bye-laws. The bye-laws in force here are the usual kind sanctioned by the Local Government Board.

M. S. A.

M. S. A. should quote the bye-law or bye-laws relied on, and state in what respect the local authority alleges that the proposed structure is in violation thereof. H. P. B.

### THE CENTRAL SCHOOL OF ARTS AND CRAFTS.

By ERNEST RADFORD.

DURING the past few days there has been held in the rooms of the Central School of Arts and Crafts, in Regent Street, the second exhibition of work by students of the school, and there is evidence of steady progress in almost every department. The outsider who learns from the secretary and the various instructors that this is beyond question the best school in the kingdom, will find the statement confirmed by the examples exhibited; but effects have their causes, and he may be tempted to ask in what respect this institution differs from others, and how the students in this Central School may be distinguished from students in general.

There are technical institutes all over the country almost, and part and parcel thereof are the schools of craft and design. The Municipality fosters them all, and so far the difference is slight, but nowhere in the provinces is there anything resembling the County Council of London, and so far as I know no school of Art which has as its central idea the tuition of those who are in some sort craftsmen already. They may be artists wanting knowledge of craft, or craftsmen who should be artists, for one whose reputation everyone envies comes only to learn the mystery of block-printing in colours, and is enrolled as a pupil in the classes conducted by Mr. Fletcher. It may happen under this beneficent rule that a pupil has even turned fifty, and the consequence is that some of the work we are shown is the production of men whose better half (not meaning the wife) has been more or less starved all the while, who have seen little but work, work, work in the task, and concerned as they are with something that is but a part of the whole have had but the slightest opportunity of seeing how the said social parts are related.

Agreed that there are no common pupils, it follows that this is no common school, and it may be inferred that the masters themselves, having so small a percentage of dullards to deal with, are quite unusually happy in what they have to be doing. Familiarity with the material breeds not contempt; say, rather, it liberates fancy, allowing him to play with it, for what meets the eye in the form of design is the creature of this association. We are told, and can easily believe, that amongst the students in the bookbinding classes there are few, if any, who cannot produce a design; and the long and the short of it is that, given the element of love in the work, the distinction between artist and craftsman will vanish. You may be one more or less, or the other, according to native inclination and tempera-

ment. Seed sown on exceeding good soil the general verdict would be. Having said so much of the pupil one might proceed to speak of the teachers, but being here amongst personal friends, the less said the better perhaps.

One generally asks on what Nature-form a conventional design is based, and one is not very far wrong in holding that, lacking Nature's suggestions, designing becomes a mere trick of space filling, which, because the trick is so common, can hardly be praised a great deal. He who flounders within the confines of a simple geometrical figure is in everyone's way, like dancers in similar plight, whilst he whose movements are easy and rythmical, is only one of some millions who have acquired the A. B. C. of the art. A genius for design—what is it? The question is hard to answer and I must be contented with saying that Nature knows her own children.

As "book openeth book," so thought suggests thought, and the consequence is a digression. The word Nature accounts for what was said last, but was originally intended to lead to some praise, not half-hearted, of the exquisite studies of plant forms by the masters Davis and Whall which may be seen in these rooms. Those shown are but a few, and one can only hazard a guess at the numbers of others that in their day have precluded the production of as many imprisoned designs.

Another and more important difference between this and other art schools is that what we see here is all evening work, it being understood that the pupils are engaged during the day, either as apprentices learning their trade or as workers deemed worthy of hire. There are one or two free classes of which particulars may be obtained, but, generally speaking, no provision whatever is made for the amateur student of drawing and painting. The word Amateur should be doubly, trebly, underlined in order to burden the memory, for amateurs are flooding the country, and their pathetically feeble work is a perpetual source of distress to the organisers of our exhibitions. We are likely to have art schools enough before long, but shall we have schools like this. If there are none like it at present there should be before very long, for no class needs them more, and it should not be hard to persuade the Lords and Commons of the vast manufacturing towns that the home art, of which so much is said, can be had, and that the right way to get it is to give even the slightest chance to the craftsmen of showing what they are capable of (even by holding night classes as here).

A word might be said in conclusion about the good things we have seen, but someone must suffer when others are praised; but while the institution itself is on trial, we should say for that what we can, speaking only in a general way of the exhibits. The only noticeable omission in the list of instructors is the name of the metallurgist, who may be supposed to be responsible for the few things in his line that are here. Of the pieces exhibited by Astin Whiting at least one or two might be attributed by the uncritical to Nelson Dawson, so this pupil has clearly a creditable past. A little electric "push" by the same hand is as amusing as it is creditable—the presence of the snail on the tablet counteracting the suggestion of speed. If one inclines to look longer at the enamels than at some of the other things, it is not only because they are pretty, but because the colour effects proper to metallic substance in flux are at once uncertain and inexhaustible, and there are always surprises in store.

In Mr. Chas. Spinner's class the names Webb and Cole were noted, for reasons which may be guessed. The designs for stained glass by A. E. Child are produced under Christopher Whall's direction, and Caterson Smith must be named as instructor; while Agnes Hoole's beautiful "Netch" design is admired.

The New Free Church at Turiff, which is to be erected at a cost of £2,500, and the foundation stone of which was laid last week, will be in the early style of Gothic. It has been designed by Messrs. D. and J. R. Macmillan, of Aberdeen.

# 'BUILDERS' JOURNAL' COMPETITION.

DESIGN BY "QUEX."

WE reproduce this week one of the designs submitted in our recent competition and highly commended by the assessor. The author is Mr. John W. Rhodes. The design was submitted under the motto "Quex," and the following are the descriptive notes and specification accompanying it:—

The amount of accommodation is provided in accordance with the wishes of the proposed building owner, but the sum quoted, namely £2,000, which he is prepared to spend, is so small for the number of rooms referred to, that the interior appointments are necessarily of a simple character. Fourteen inch walls are built up to the plates, but these could be reduced to 9in. in the upper storey with 14in. sills at judicious intervals, to cheapen the work if necessary. The eaves of the roofs have been carried out to a considerable distance from the walls to avoid rain water damage, on the score of economy. The flats and shingle roofs, however, are drained into gullies, except southern portion of the latter which discharges into drainage. Conservation of water disposal can be arranged if the drippings from eaves are objected to. No information forthcoming as to water supply or the heating medium. It is presumed the former is laid on and that lamps are the suggested illuminating power.

The tangent plan of the kitchen offices is adopted for the following reasons:—Morning sun is admitted to dining-room and three bedrooms; larder and principal window to kitchen face a cool quarter of the compass; privacy of the pleasure gardens is assured; and picturesque treatment is imparted to the design by the grouping of the roofs at the junction of the main ridges.

The central situation of pantry and service will be appreciated. The hall is so arranged that curtains hung from beam under gallery will partially isolate hall, enhancing its comfort as a living space and improving its aesthetic value. The building is well lighted throughout, the plan is economical to work from a domestic standpoint and the interior decorative work is consistently treated with the spirit of the building as a whole.

CONCRETOR.—Shingle ballast being obtainable with ease at Hythe the foundations and battered plinth to the moulded string course will be constructed in cement concrete. The weathered character of the latter caused by added boarding which will form the sheeting.

The whole site will be covered with concrete and floated up where required to take tiles, &c.

BRICKLAYER.—Damp course of bitumen used hot.

Air bricks for all hollow floors.

Brickwork in well burnt grizzles and mortar, half brick walls in cement.

Brickwork where thatch or shingles impinge on flues 9in. thick.

Firebricks for fireplaces built in solid.

Scullery and all contiguous offices internal flush joints, then twice limewhitened, floors finished with trowelled cement, as also bicycle house. Hearths to servants' fire-places and range in cement.

Intermediate spaces of half-timber work in trowelled cement 3in. from timber face.

DRAINAGE.—Drains in socketed glazed earthenware, properly jointed and laid on concrete, and enveloped in same where passing beneath buildings. All junctions in inspection chambers.

Cesspool of the ordinary character with separator and pump for garden purposes in position, to be selected at least 150ft. from buildings.

All drains thoroughly ventilated and to stand water test.

VENTILATION.—Exhaust flues are provided for boudoir, library, and one and two bedrooms, also for dining-room and bedrooms four and five. Bedrooms three and six have openings through outer walls, all fitted with silent flap outlets.

Bedrooms and best w.c.'s fitted with zinc exhausts to gable ends, latter from highest point in ceiling, and bedrooms from walls as near this point as possible.

TILER, &c.—Approved red tiles to verandahs, hall, ingle porch, and outside same; encaustic tiles to principal hearths.

Moulded glazed earthenware curbs to some hearths.

Kent's crystal to larder, and splash screens to scullery, sink, baths, and lavatories.

MASON.—Corsham Down stone mullions and dressings to dining-room and No. 4 bedroom windows, copings, corbels, carved panel and drip-stone over front door, and moulded heads to stacks.

Moulded Portland stone curbs to library, hall, and dining-room.

Kentish rag to plinth-height entrance porch.

CARPENTER AND JOINER.—All work in deal and fir unless otherwise stated.

External half-timber work, rafters, brackets, &c., left sawn face and coated with Stockholm tar.

Cantilevers of oak.

Roofs over servants' bedrooms, top of secondary stairs, and Bicycle house covered in oak shingles on boards.

PERSPECTIVE SKETCH. BY JOHN W. RHODES ("QUEX").

Moulded external woodwork to be wrot and painted, including barge boards.

No half-timber construction will show less than 6in. on the face, except otherwise stated.

Half-timber work of partitions to 2 and 3 bedrooms, and enclosing gallery, and forming upper part of hall to show 5in. on face towards hall only, to be wrot, plaster to recess 1/4in.

Front door and contiguous framings of English oak as shown.

Kitchen offices and servants bedrooms ledged and braced doors.

Remaining 2, 3 and 8 panel doors to special design.

Oak thresholds to front and garden entrance doors.

Plain solid frames flush with rough cast and moulded casements.

Boudoir 4 1/2in. battens for styles and rails on plaster plugged for same to form panelling.

Architraves, skirtings, etc., purposely designed for respective rooms. Bedrooms treated in the simplest manner.

Teak newels and storey posts in hall moulded and carved with restraint.

Teak handrails and oak balusters.

Stairs to have planted ornamental nosings and housed strings.

Mantels in hall, dining-room and library in oak, boudoir in deal.

Teak seats to best, and deal seats to servants' w.c.'s.

Cupboards with roofs to stop collection of dust.

1 1/2in. yellow floors in narrow widths. Ground floors straight upstairs grooved and tongued.

IRONMONGER.—Hinges in servants' quarters wrot iron cross garnets, remainder wrot butts, Norfolk latches and fasteners throughout except outer doors.

Outer doors furnished with efficient locks and bolts and casements with cockspurs and stays of good quality.

Roofs covered with thatch except otherwise stated, sewn with copper wire and split hazel ties and binders. Eaves project 2ft. 9in. Thickness of straw not less than 10in. and at ridges and valleys 13in.

No pitch less than 45deg. except over window No. 2 and five bedrooms and bathroom No. 1.

Scraper, holder, and lamp of wrot iron. Letter plate, knocker, &c., of hammered copper.

FOUNDER.—Double oven ranges to kitchen and scullery, with high pressure boilers in each, both coupled up to service and having disconnecting cocks.

Note.—I have used this system with very satisfactory results. It enables the cooking to be done in scullery during hot weather, the scullery boiler doing the work of kitchen range when the fire of latter is out.

Galvanised iron hot water and lead-lined storage cistern and waste preventer cisterns to w.c.'s.

Cast iron rain-water gutters, heads, and down pipes where required.

Vane in wrot iron.

All bedrooms in cast iron mantle registers, Ashbee's and Benson's designs.

BELLHANGER.—Hanging bells used throughout.

PLUMBER.—Flats, valleys, etc., in 6lbs. lead.

Ridges to shingle roofs, and flashings round stacks to be in 16oz. copper.

5lb. lead secret gutters and dressings to shingle roofs.

Drawn lead soil and other pipes.

Cast iron Roman baths.

7lb. lead trays to these, and 5lb. lead ditto to storage cisterns with overflows.

One first floor w.c., valve pattern.

Remaining, wash-down pattern, with large water surface and one with slop top.

Housemaids' sink of 7lb. lead.

All sanitary work of the best with anti-siphonage pipes and ventilated from end to end.

PLASTERER.—Battered plinth rough, rendered in Portland cement and coke breeze. Upper weathering of plinth trowelled cement, coloured approved green before using.

Three coats internal work throughout, except scullery and contiguous offices.

Portland cement rough cast on all outer walls and stacks. Gravel to pass through a 1/2in. mesh (no pebble dashing).

Stacks to be packed out same thickness as rough cast to take flashings.

GLAZIER.—Windows and borrowed lights, 21oz. sheet lead light and roundels where approved.

Panels in front and garden entrance doors in obscured lead light to special design.

Bath rooms, w.c.'s, servants' stairs, and bedroom, 9in. obscured lead light.

Upper panels of small dining room window in stained glass to special design.

PAINTER AND DECORATOR.—External and internal wood and iron work, unless otherwise stated, painted four oils.

Front door and contiguous oak work fumigated dark and treated with linseed oil.

Hard woods internally hand polished.

Half timber work in hall to be stained green and coated boiled oil.

All new internal vertical plaster work to be coated with sterilising liquid, and papered with Essex or Jeffreys papers, except panel work and hall walls.

All walls of hall below coves to be covered in coarse granulated Japanese slightly tinted rice paper, and stencilled to special design.

## REGISTRATION OF ARCHITECTS.

### INTERVIEWS AND LETTERS.

THE discussion on the Registration of Architects is at present occupying the attention of the profession more than any other subject. It is not a new question, and many architects will remember the excited controversy it caused a few years ago. A large number of the letters which have appeared in this journal on the subject have been in favour of the proposed change, and in order to ascertain the opinions of some of the most prominent London architects, a representative of THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD has been interviewing them upon the subject. Before giving their opinions, it may be useful to state a few of the principal clauses of the Parliamentary Bill in which the proposals of many who approve of the principle of compulsory registration are given a definite shape. The

#### Architects' Registration Bill

passed its first reading on March 7th, 1893. It provides that every person who, at the date of the passing of the Act, is a Fellow or Associate of the Royal Institute of British Architects, shall, in respect of such membership, be entitled to be registered without payment of any registration fee, and so long as he is connected with the Institute shall be exempt from the payment of an annual renewal fee. Any person who was actually practising Architecture prior to January 1st, 1897, or who has served as apprentice, assistant, or practitioner in Architecture for seven years after having attained the age of fifteen years prior to the passing of the Act, shall be entitled to be registered. An applicant for admission after the passing of the Act must not be less than twenty-one years of age, and must have served as apprentice for not less than three years with a registered practitioner, and have passed a qualifying examination in accordance with the Act. The qualifying examination shall be held for the purpose of conferring the right of registration under this Act by the R.I.B.A. or any other body appointed by the Privy Council.

#### The Standard of Proficiency

required from candidates at these qualifying examinations is to be such as sufficiently to guarantee the possession of the knowledge and skill requisite for the efficient practice of Architecture, and it is to be the duty of the general council to secure the maintenance of this standard of proficiency; and for that purpose inspectors appointed by the general council are to attend, as the general council may direct, at all or any of the qualifying examinations. It is also provided that on and after the passing of the Act, it shall not be lawful for any city, borough or township, rural, urban, or sanitary authority, county council, local board of health, vestry, board of works, or other public body, to appoint any unregistered person to prepare, examine, approve or pass plans of buildings and their constructional or sanitary arrangement, or to examine or report upon buildings erected or to be erected. According to the Bill, no person will be entitled to call himself an architect (either alone or in combination with any other word or words, save only that of naval architect) unless he is registered. One of the first architects whom our representative visited was

#### Mr. T. Walter L. Emden,

the president of the Society of Architects. Mr. Emden was found busily occupied with his morning's correspondence. In reply to a

request for his opinions on the Registration of Architects, Mr. Emden said, "I have very little to add to what I said at the recent meeting at Sheffield. I joined the Society of Architects because they took the matter up strongly, and to assist in the movement. Any course that I could reasonably take to bring about registration, I would take. I am sure one-half the 'blackmailing' cases we have are caused by the fact that people who are anything but proper or competent persons to have in the profession can come in without anybody being able to prevent them. Once a man is under registration, and liable to have his diploma taken away or suspended, he would have to be extremely careful that what he did was of a proper nature. The Incorporated Law Society has a considerable hold over its members. If architects were registered, they would be in the same position. The great mass is entirely outside any society, and absolutely without any control of any description." Our representative asked Mr. Emden what he thought of the attitude of the Institute. Mr. Emden said: "They have, as a body, passed a number of resolutions in favour of Registration, but, immediately it comes to the question of taking action—going into Parliament—they are afraid that the time has not quite come, and 'have doubts,' as the Scotchman said." Our representative next made his way to the offices of

#### Mr. E. R. Robson, F.R.I.B.A.,

which are in the Palace Chambers, Westminster. In response to a request for his opinions on the object of the Bill, Mr. Robson replied: "It is a subject that will press itself to the front, as, ultimately, people will have to know who are the guardians of architects. Whether we have got to that strait yet, I am not sure. The difficulty will lie in knowing who is an architect in the highest sense. I am strongly of opinion that the outside public ought to know who are architects in the ordinary sense, and that the profession needs protection from the hoard of builders who are really practising, with a trained or half-trained assistant, in architects' places. We shall never get protection for the architects' profession as the law and medical professions are protected; but something ought to be done to give every architect a status as such in the eyes of the public. Registration will place all architects in a condition of equality as to status, but they will have to emerge from that by their ability." At the School Board Offices on the Victoria Embankment

#### Mr. T. J. Bailey, F.R.I.B.A.,

architect to the School Board for London, was found in his pleasantly-situated offices. When approached upon the subject of this article, Mr. Bailey said that he had not recently seen the Bill for the Registration of Architects. Our interviewer had the Bill with him, and after glancing through it Mr. Bailey said: "Anything to prevent men from setting up as architects and building abortions I am in favour of. The examination at the Institute is a proper step in the right direction, although I do not know whether it goes far enough. Everybody calling himself an architect ought to go through the regular routine. I do not think that any quack doctor who has probably effected some cures would be accepted as a member of the College of Physicians and Surgeons because he had been a success in that way. Not that I want to compare men who have done high artistic work, like some of the members of the Institute, with quack doctors. I do not think a young man who has passed all the examinations should be allowed to be registered as an architect unless he could show he had some knowledge of archaeology, and some original spirit of design, founded on a knowledge of old work, which should be judged by some of the highest artistic architects. At present I think it is anything but practical knowledge which enables a man to pass examinations and get into the Institute and kindred bodies."

#### Mr. E. Guy Dawber, A.R.I.B.A.,

is in favour of registration. "I used not to be so," said Mr. Dawber, "but as we get older

we get wiser, and see things in their proper light. I think registration would improve the status of the profession. It would, to a great extent, keep out a large number of incompetent men." Mr. Guy Dawber also thought that the clause providing that only registered architects should be employed by county councils and other public authorities was a good thing.

#### Mr. W. A. Pite's and Mr. R. A. Briggs' Opinions.

Mr. W. A. Pite, F.R.I.B.A., was in favour of the Bill so long as it only attempted to institute an examination of a man's practical knowledge. Mr. R. A. Briggs, F.R.I.B.A., said:—"I am afraid I do not hold very strong views on the subject of Registration, my idea being, with regard to architects, that 'by their fruit ye shall know them;' and if the public are such fools as not to be able to distinguish between good and bad, they must be the sufferers if they go to incapable architects. I am strongly in favour of the R.I.B.A. being the representative body, and that all architects should be members of that body. As there are good, bad, and indifferent doctors, so there are good, bad and indifferent architects, and always will be, as long as the world wags. If Registration will keep out incompetent men, I will support it."

#### Mr. Beresford Pite, F.R.I.B.A.,

was unfortunately unable to see our representative upon the subject, but wrote to us a letter explaining his views. He said:—"I have no very definite view on the subject of registration as yet. On the one hand the advantage of excluding improper persons, either through character or ignorance from practising the art at the risk and cost of the public is very self evident; but on the other hand, registration if exercised by any existing professional body of architects, would tend to make Architecture a close profession instead of a free art. We must in view of this make large sacrifices for the general liberty of the subject, and for the particular liberty of the artist. If the R.I.B.A. would alter their 'examination in Architecture' into an examination in building science and draughtmanship, leaving art, design, and history of Architecture out of it altogether, a great step would be taken towards obtaining an examination that would be a safe basis for qualification as a registered surveyor of building works. Examination in similar subjects by any recognised body (say under the Science and Art Department, save the mark) would also provide qualification for employment as surveyor. This should be as open and easy of attainment as public safety can allow. Having obtained thus much, every builder, contractor, inspector, surveyor, architect, and anybody charged with, or undertaking any building work whatever, should be examined and registered. But is this not Utopian? If not, let us have it and as soon as possible."

#### Mr. Arnold Mitchell and Mr. Arthur Cates.

Mr. Arnold Mitchell, F.R.I.B.A., says "a judicious scheme of registration might be for the benefit of architects, but I think it a very open question." Mr. Arthur Cates, F.R.I.B.A., is an old opponent of registration on the lines of the Bill. Our interviewer saw Mr. Cates at his residence in York Terrace, near Regent's Park. "In 1855," he said, "there was a strong feeling that the system of pupillage was defective. A pupil's friends paid large premiums for the privilege of the run of the office, in return for which the pupil was allowed either to waste his time or to devote himself to carrying out his master's work, work which in most instances should have been done by paid assistants. In fact, no real system of education existed. The appearance in the Parisian Journal 'Encyclopedie d'Architecture' of a series of articles by M. Adolphe Lance, 'du Diplome d'Architecte,' gave a new direction to this feeling, and resulted in the Architectural Association being induced to send a memorial to the Institute, asking them to establish an examination in order that the education of the young architect might be placed upon a proper basis, and his

qualifications to practise the profession be duly ascertained. In the course of years the Institute established the voluntary examination, and ultimately the present obligatory examination for associate membership was established. It was a long and desperate fight to get it done, and I only succeeded because I happened to be for some years a member of the Council, and, I think, fourteen or fifteen years chairman of the Board of Examiners. In France there has been a continued effort to obtain the official diploma, but, as yet, with no result. The École des Beaux Arts established a special examination, and granted a diploma which has been taken by, perhaps, some four hundred architects in France, but no compulsory diploma has been established, neither am I aware that with the exception of a few states in America, there is anything at all parallel to the registration scheme in force. That you want first of all is to make architecture a profession, as well as an art. The promoters make a great mistake in attempting to establish an analogy between the professions of law and medicine and of architecture. The first step towards placing the practice of architecture in

#### A Satisfactory Position

the public would be to establish it as a profession, to secure the satisfactory education of its members, and in so far secure to the public that the possessor of an authoritative diploma had a certain minimum of knowledge of the theory and practice of the profession. It has always appeared to me that the initial steps in this direction could be most effectually provided by the action of the R.I.B.A. if that body received from the general mass of the profession the support to which it is entitled. At present, under its new constitution, the Institute offers every facility for attaining these objects. It has ceased to be an almost exclusive London body it was in former years. It has established intimate relations with the leading provincial societies, and has removed the objection of a double subscription by relieving those provincial members of its body from the payment of their subscriptions to the local societies, the amounts of these subscriptions being discharged from the general funds of the Institute. The objection of double subscription being thus removed it would be expected that provincial architects would desire to join the Institute, and so materially strengthen its powers. To those who may not be qualified to desire to become Fellows, and who, being in practice, would not be able to devote sufficient time for the necessary preparation for the progressive examinations for Associateship, there is a special examination, which any architect of even moderate attainments should be able to pass with facility, and thus obtain the diploma of an Associate of the R.I.B.A. by examination.

#### Strength in Unity.

The advocates of the Registration Bill would do well to show the real earnestness of their desire by becoming members of the Institute, and ultimately by force of numbers influencing the action of that body in the direction they desire. It is to be most deeply regretted that at the present time the action is not adopted, as it would tend so greatly to the consolidation of the profession and to the individual interests of its members. As regards the policy of registration, while quite admitting the difficulties and hardships which in some cases exist in the provinces by the action of unqualified persons, I cannot accept the arguments which I have so generally heard put forward in its support in any way effective, neither do I believe that there is any such analogy between the professions of law and medicine and that of architecture as to justify the establishment of an exclusive monopoly of the designating architect, such as appears to be the aim of the Architects' Registration Bill. Further, I do not think its promoters would be able to justify before the searching inquiry of the Select Committee of the House of Commons the grounds upon which they seek to establish an exclusive monopoly of a name or title."

**Mr. P. G. Smith and Mr. E. W. Mountford.**

The interview with Mr. Percival Gordon Smith, F.R.I.B.A., architect to the Local Government Board, was a short one. Mr. Smith, probably owing to the fact that he is in an official position, would not at first give his opinion for publication, but our interviewer managed to extract from him the statement that he "did not think the Bill as it is drafted will effect its object." Mr. E. W. Mountford, F.R.I.B.A., expressed himself in the following terms:—"As a member of the Council of the R.I.B.A., I would support a Registration Bill if I were convinced that the majority of the members of the Institute were in favour of such a proceeding, but my own personal feeling is against it. There is no evidence that it would improve the general quality of modern architecture, and I do not believe that it would improve the 'social position' of architects, upon which it appears to me too much stress is laid by the supporters of the present Bill. The general tendency would be to make architecture more of a profession and less of an art. Architects, it appears to me, are themselves to blame for any want of consideration they may receive from the public, owing to the eagerness with which they seek for work upon any terms, and the means they employ to obtain their work."

#### Some Other Opinions.

Owing to absence from town and other reasons there were some gentlemen whom our representative was unable to see, but who sent their opinions by letter. Among them was Mr. Ernest George, F.R.I.B.A., who wrote, "I regard any system of registration as undesirable. Persistent study is necessary to the architect, and examinations on construction are useful to the student as tests of his acquired knowledge. I do not, however, know the examining body that is competent to give a diploma, or to arm its graduate with a certificate of ability. Artists (and among them architects) should be born, and not made by a course of drilling and examinations, much as they may be helped by the latter." Mr. R. S. Balfour, A.R.I.B.A., holds the view that "inasmuch as registration would certainly not exercise any fostering influence on the artistic side of the profession, which is more than sufficiently trammelled already, it would be most undesirable. If, however, some means could be found whereby a certain class of persons can be prevented from styling themselves 'architects,' and practising as such, greatly to the detriment of the profession and its status in the eyes of the public, it would fulfil the most cogent arguments of those who are in favour of actual registration. Unless it is possible to attain this object, I, personally, consider things are best left as they are." Mr. A. E. Street, F.R.I.B.A., has sentimental objections to the closing of the profession, but what they are he does not say. He does not see that registration is necessary for the protection of the public or of architects. Mr. John Belcher, F.R.I.B.A., and Mr. James Brooks, F.R.I.B.A., write that they are opposed to registration.

**A Stained-Glass Window**, the work of Messrs. Ballantine and Gardiner, was recently placed in the south transept of St. Cuthbert's Church, Edinburgh.

**Roman Antiquities at Kirkintilloch.**—At the monthly meeting of the Burgh Commission on Tuesday night, Mr. John Cameron referred to the ancient stones which had been unearthed at the public park while workmen were engaged cleaning the moat at the Peel. The attention of Mr. McGregor Chalmers, architect, Glasgow, had been called to them, and he made a careful examination of them. He discovered that some of them bore undoubted traces of Roman architecture, being distinctly marked by diagonal lines and other markings peculiar to Roman artisans. The stones had been used in the construction of the fort on the Antonine Wall passing through the park. The bulk of the stones, however, was of a mediæval period, and had no doubt belonged to Comyn's Castle, which was demolished by Robert the Bruce.

## Correspondence.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

FROME.

SIR,—Will you please explain whether the provisions of the Architects' Registration Bill require a person who is at present unqualified as regards a diploma to show that he possesses the necessary experience and training before he will be allowed to practice as an architect? I think some arrangement should be made for men who have been in practice for a certain number of years. For instance, is a man who has practised for a number of years to be disqualified because he cannot afford the time or expense to pass the necessary examinations, or if he is so situated that the opportunities of study cannot well be obtained? I am in no way opposed to registration, but I like fair play.—Yours, &c.,

A COUNTRY PRACTITIONER.

[This question is answered in a summary of the chief provisions of the Bill given on the previous page. The proposed fee for Registration will be fixed by the general council, but pending the fixing of the fee by the council a fee of £5 is to be paid. The members of the R.I.B.A. will, however, be exempted from the payment of this fee. A copy of the Bill, price 3d., may be obtained from the Society of Architects, or the Queen's Printers.—ED. B. J.]

To the Editor of THE BUILDERS' JOURNAL.

ST. JAMES'S HALL, PICCADILLY, W.

SIR,—In further reply to H. D., while the desirability of apprenticeship, as a preliminary to entering the profession, may, under present conditions be open to question, there can be no doubt that registration by compulsory examination would render the training of the pupil a far simpler and yet more thorough matter than under the present system, which often of necessity means that the pupil must largely depend upon his own exertions to acquire knowledge, and the result is that unless he has an unusually strong sense of what is due to himself he will only by choice take up congenial and easy tasks, whereas with examinations looming ahead, which he knows he must pass, he would at once have an incentive and guide, and much valuable time now wasted would be directed into proper and profitable channels.—Yours &c.,

C. MCARTHUR BUTLER.

Secretary of the Society of Architects.

### RIGHTS OF LIGHT.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, S.W.

SIR,—Much has been said in praise of brevity, but there are occasions in which brevity may lead to misconception and error, and of such is one of the answers on page 326 of your issue of July 5. G. J. asks: "How long does it take for my neighbour to acquire a right of light to a window overlooking my property?" H. P. B., whose answers are usually very brief, answers this query in two words, "Twenty years." Now, it seems to me that such a question as this deserves a little more consideration, and the enquirer a little advice, for, while being nominally correct, the answer is practically incorrect, as a right to light may really be acquired in nineteen years and one day.

In G. J.'s case there is no uncertainty. It is a matter of statute law, and quite within the provisions of the Prescription Act of 1832, Sec. 3 of which states: "When the access and use of light . . . shall have been actually enjoyed . . . for the full period of twenty years without interruption, the right thereto shall be deemed absolute and indefeasible . . . unless it shall appear that the same was enjoyed by some consent or agreement expressly made . . . by deed or writing." And Sec. 4 says: "No act shall be deemed an interruption, unless the same shall have been, or shall be, submitted to . . . for one year

after the party interrupted shall have had or shall have notice thereof."

It follows, therefore, that if a certain access of light has been enjoyed for nineteen years and one day without a complete year's interruption during that period, the easement is acquired and the servient owner is helpless, for the simple reason that the remaining fraction of the twentieth year counts for nothing.

If G. J. has not yet submitted to the easement referred to for nineteen years; he would do well to ask the beneficial owner of the neighbouring property to sign a deed disclaiming any right to an easement of light over his (G. J.'s) property, and agreeing not to take action at law in case he (G. J.) proceeds at any time to build on his own land or to do any other lawful act to the prejudice of the light at present enjoyed, threatening in the alternative at once to erect a black screen of sufficient size to block out the light. G. J. could, of course, erect his screen at once, but as the window is high and a short distance from the boundary, the screen, to be effective, must be large and strong, and, therefore, expensive; and his outlay might as well be saved, as the deed could be made to meet all G. J.'s requirements, while the neighbour would, if he is wise, find it his best policy to sign without demur.—I am yours, &c., J. D.

## THE ARCHITECTURAL ASSOCIATION.

### VISIT TO GRIM'S DYKE.

SOME thirty members of the Architectural Association visited the residence of Mr. W. S. Gilbert, "Grim's Dyke," Harrow Weald, on Saturday afternoon, on one of the summer trips organised for June, July and August. Taking train from Euston, the party reached Pinner, and walking thence to the breezy upland of Harrow Weald Common, on whose borders the estate of Grim's Dyke is situated, arrived on the spot at 3.30.

There is a peculiar interest about this work of Mr. Norman Shaw's budding genius (it was built twenty-nine years ago!) which is partly due to its being the forerunner and exemplar of very many more recent essays in the domestic Elizabethan style, and partly owing to its present ownership. The personality of Mr. W. S. Gilbert, the founder and by far the most brilliant exponent of a school of dramatic humour which has long since been accorded the title "Gilbertian," would have a power to transcend a residence with no claims to distinction; but when, as here, you have a house of Norman Shaw's design which has set the fashion and has helped to turn the current of modern domestic architecture into more gracious channels, the interest it holds is great.

It was in 1870 that the then rising young architect, Norman Shaw, built this house for Mr. Goodall, the R.A. Artistry, unwedded to an overwhelming luxury, was the note of the place, as originally built, and "Graeme's Dyke," as the orthography of it was first used, has, in fact, the reputation of being the cheapest house for its size that the architect ever saw to completion. To the painter succeeded a Mr. Heriot, of whom Mr. Gilbert, tired of a town life, and even of his fine house in Harrington Gardens, Kensington, purchased the estate eleven years ago.

The house is a red-brick, many-gabled building in the late Tudor style, some of the gables being tile-hung, others—notably the great gable overhanging the entrance—half-timbered. It is hidden away from the road and the lodge down a prettily-wooded drive. Built originally for the use of an artist, the domestic arrangements and the actual plan of the house were dependent upon the studio and its lighting. The plan is, therefore, not being built upon one axis, somewhat puzzling to strangers, the more especially so since Mr. Gilbert has built a new wing, designed by the late Mr. Arthur Cawston, containing billiard-room and additional bedrooms above. The studio was built with the usual object of

securing the best painting light, and the remainder of the plan was determined by the position of the prehistoric moat in the grounds—the "Grim's Dyke," from which the house is named. This mysterious earthwork, a fragment of a long-continued line extending through Middlesex, Herts and Bedfordshire, is supposed to have formed the boundary or one of the ancient British kingdoms. It has been broken up by the plough in many places, but is perfect here, and, filled by land-springs, brims with water in which lilies and tall rushes grow luxuriantly. Here, shaded by overhanging trees, and green with moss, stands a battered old stone statue, removed from Soho Square, of King Charles the Second clad in Roman costume.

But to review the house itself. Much money has been spent upon it by its present owner. The floorings, originally of deal, have been replaced with oak parquetry, and many other improvements effected. The studio has become the drawing-room, and a very fine drawing-room, with its timber-framed wagon-roof, it makes. Great mullioned windows are features here as in all the principal rooms. A highly elaborate alabaster chimney-piece of almost constructional aspect, designed in a somewhat grotesque Renaissance convention, with satyr caryatides and an upper range of female caryatid figures, was the work of Mr. Ernest George, from ideas supplied by Mr. Gilbert himself. The sculptor was a French artist, whose figures were, as Mr. Gilbert says, gross and fleshy in the first instance, before he was obliged to take them down. The dining-room, panelled in oak, has an ingle-nook and is lighted by a mullioned window occupying the whole of one side.

The new wing is, on the whole, an inoffensive follow-on to Mr. Shaw's design; all save the dark and heavy billiard-room, whose coarse details ill assort with those in the other part of the house. It is, in fact, what no billiard-room should under any circumstances be, distinctly depressing.

The constructional details of the house have come well out of the test of nearly thirty years, and as age comes upon it, it will take on to the full that mellowed charm which belongs to mansions of the Elizabethan period. Already those oak timbers of the gables which have not been treated with oil or paint have taken on that delicate silvery hue which weathering alone can confer. C. G. H.

**New Public Baths at Govan.**—At the Dean of Guild Court last Wednesday sanction was given to the Commissioners for the erection of public swimming baths in Summertown Road and Church Street. The building, which will be of red sandstone, will have frontages of 175ft. to Summertown Road, 76ft. to Church Street, and 143½ft. to a proposed new street to be formed parallel to Church Street. The plans provide for two swimming ponds, each 75ft. long by 35ft. broad, eighteen hot-water slipper baths for gentlemen, and five for ladies. There will also be a public gallery above the large pond to accommodate 600 people, a gymnasium, committee rooms, boiler-house, and the other necessary apartments on the ground floor, including a dwelling-house for the bath attendant. The estimated cost of the building is £22,000.

**The Aberdeen Fish Market** is to be extended. According to plans submitted, the length of the extension along Market Street will be 424ft., and the width of the market 50ft. over the walls or pillars, with a space of 10ft. between the front pillars and the dock. The wall to Market Street above the loading bank will be of Ruabon pressed bricks, and the roof will be of wood and slated, while the centre portion of the roof will be utilised for empty boxes if thought desirable. The office, which will also be built of Ruabon brick, will contain refreshment rooms, superintendent's room, telegraph office, &c. The cost of the building, exclusive of the extension and strengthening of the wharf, is estimated at £6,500. On the plans being approved by the Harbour Commissioners the work will be proceeded with.

## Bricks and Mortar.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

### The Exploration of Palestine.

THE annual general meeting of the Palestine Exploration Fund was held last Tuesday week at the Royal Institution. Lord Amherst occupied the chair. An abstract of the report for 1898 was read. The Executive Committee stated that the excavations determined on last year at Tell-es-Sâfi, supposed to be the ancient Gath, had been begun, and were now being carried on by Dr. Bliss and Mr. Macalister. Operations were commenced at Tell Zakariya. Dr. Bliss had sent a general account of the work of the year. Tell Zakariya is a hill, and on it the explorers had found a large fortress, of irregular shape, measuring 200ft. on the west side and about 120ft. on the north. The walls are about 6ft. thick, and built without mortar. About half the area had been examined down to the rock, and the debris had been proved to consist of two strata—one a pre-Israelite stratum and the other a Jewish stratum, slightly disturbed in Roman times. The fortress may possibly be the work of King Rehoboam, who built so many cities for defence. In the lowest stratum, near the rock, was found a buried jar, broken, but *in situ*, containing, among other Egyptian amulets, scarabs of Thothmes III. and his great-grandson Amenhotep III. These Pharaohs reigned about 300 years before the Exodus. Pre-Israelite and Jewish pottery was found in large quantities, and objects in stone, bronze, iron and clay were numerous. The explorers subsequently broke ground at Tell-es-Sâfi, and were still working there at the time Dr. Bliss sent in his report. He concludes his report by stating that their ability to turn over as much debris as possible in the future depended largely on the subscribers to the Fund. The treasurer's statement showed that the income of the Fund in 1898 was £2,600 and at the end of the year the balance at the bankers was £674. Mr. W. Morrison, M.P., moved the adoption of the report, Dr. Löwy seconded, and the motion was adopted. Major-General Sir Charles Wilson then delivered an address on his recent travels in Moab and Edom, which was illustrated by lantern slides.

### The Italian Exhibition Destroyed by Fire.

THE destruction by fire of the International Electrical Exhibition at Como, including the exposition of silk and sacred art, is to be greatly deplored. The fire started in the electrotechnic department and spread with great rapidity; in fact a witness, who was present at the Charity Bazaar fire in Paris, says that in Como the fire spread more speedily, literally eating up everything within its reach. The building was semi-circular in form, with a centre, six wings and a gallery, where the Volta relics were kept. The latter only opened to the inside of the building. The picture of Volta showing his battery to Napoleon, the sword of honour presented to him by the latter, and various personal relics were saved at great risk; but the only authentic portrait of the great

electrician, his will, his precious manuscripts and books, his original battery, and other invaluable objects were destroyed. The other exhibits shared a like fate; but by the efforts of the soldiers and firemen the Sacred Art Department and the exhibit of the Docks and Lake Navigation Company escaped. The damage cannot yet be estimated as many of the exhibitors were not insured, and numbers of the articles destroyed were priceless, as they cannot be replaced. The committee of the exhibition have resolved to rebuild the building, and have collected a handsome sum for the purpose.

#### Mr. Sigismund Goetze's Paintings.

DR. TRISTRAM, Chancellor of the Diocese of London, gave his decision last week on the faculty reported in our issue for April 26, asked for by the Vicar and two Churchwardens of the Parish Church of St. Botolph Without, Aldersgate, to make alterations to the interior of the church. The proposed alterations consisted in the decoration of the east wall of the chancel above the holy table by three oil paintings presented by the artist, Mr. Sigismund Goetze, the subjects being "The Dead Christ," "Watch" and "Pray." The addition of these paintings would require the removal of the panels on which the Ten Commandments, the Lord's Prayer, and the Apostles' Creed were inscribed, and new panels having these painted on were to be placed on either side of the apse facing the congregation. The painting of "The Dead Christ" was exhibited at the Royal Academy last year, and represented our Lord lying prostrate in an almost nude state in the tomb of Joseph of Arimathea. The other two had been painted since; the one named "Watch" represented a Roman soldier clad in armour such as was introduced in the Middle Ages, and the other, called "Pray," represented a female kneeling in the attitude of prayer. These it was proposed to place one on each side of the central painting. Objection was taken on the ground (1) that there was an absence of all evidence that the proposed alterations were necessary, or that they would be an improvement to the church; (2) that their introduction involved the removal from the east wall of the chancel of the Ten Commandments inserted on the panels as well as the Apostles' Creed and the Lord's Prayer; (3) that the central painting did not represent with historical accuracy the scene of our Saviour in the tomb as handed down in Holy Writ, and that the soldier in the picture called "Watch" was not attired as a Roman soldier would be guarding our Saviour's tomb, but in plate armour such as was first introduced in the Middle Ages; (4) that the introduction of the oil paintings would not harmonise with the existing stained glass windows and painted panels that had been there since 1788; and (5) that the vicar had done a great deal of good work in the parish since he had come into it, had increased the congregation, and had worked harmoniously with the parishioners, but that the introduction of the pictures into the church would be offensive to many parishioners who were staunch supporters of the church and would introduce a bone of contention into the parish where there had been none before. The Chancellor agreed with Mr. Cristian, the architect to the City of London Parochial Charity Commissioners, who had put the church into repair, that the church was so tastefully decorated as not to require alteration. He did not consider it part of his duty to determine in the present case whether the introduction of paintings in the apse would or would not be an improvement. What the Court had to determine was whether the objections taken to these paintings as church decorations, and in particular to the central one, might not be conscientiously entertained by members of any congregation in our church without disparagement to those who might entertain a view favourable to them; and as from the evidence the Court was satisfied that no less than 121 resident parishioners and Churchmen, eight of them being past churchwardens, conscientiously objected to their introduction, though it be on a matter of taste, and that

their introduction would offend their religious feelings; it felt, therefore, that in the exercise of a judicial discretion its duty was to decline to sanction their introduction by faculty. The Court, in coming to that decision, desired to add that it was far from its intention to depreciate Mr. Goetze's generosity in offering to present the paintings for the decoration of the church. The petitioners would pay their own costs. It was intimated that the petitioners desired to appeal against that part of the Chancellor's judgment which refused the faculty.

**Fire Tests with Floors.** WE have received Publication No. 21 of the British Fire Prevention Committee which deals with a test made on May 25th on a floor of steel joists with concrete filling, the breeze and cement composing the concrete being in the proportion prescribed by the London County Council in their addenda to schedule No. 2 of the Building Act of March 28th last. This particular floor, however, was given extra fire resistance: first by the corrugated iron centering, which was used in the construction and not removed; and, secondly, by a suspended lath and plaster ceiling. The floor was constructed according to the specification of Mr. Ellis Marsland, the District Surveyor of Camberwell. The area of the floor under investigation was 100ft. superficial in the clear (10ft. by 10ft.), and it was loaded with 168lb. per square foot. The materials of which it was constructed were of the ordinary kind, and the time allowed for the construction and drying of the floor was one month. The floor was subjected to a fierce fire of an hour and a quarter's duration, gradually increasing to a temperature of 2000 deg. Fahrenheit, followed suddenly by the application for three minutes of a stream of water. The effect of the test was that the suspended ceiling below the floor fell during the test, and the concrete was slightly disintegrated on the underside. The floor was deflected during the test  $2\frac{1}{2}$  in. in the centre, but subsequently returned to within 1 in. of level. The fire did not pass through the floor. The pamphlet containing full particulars of the test can be obtained from the offices of the Committee, 1, Waterloo Place, Pall Mall, S.W., price one shilling.

#### Devon and Exeter Architectural Society.

THIS Society have just issued their "Journal of Proceedings" for 1898-9. The list of membership has increased from sixty-eight in 1898 to seventy-one. Since the annual meeting at Exeter on May 7th, 1898, six general meetings and seven meetings of the Council have been held. The Society have considered the Architects' Registration Bill, and find that the R.I.B.A., the Leeds and Yorkshire, and the Birmingham societies are against the Bill, and that the Society of Architects, the Dundee Institute, the Northern Architectural, and the Sheffield societies are in favour of it; while the remaining societies allied to the R.I.B.A. are either neutral or have not given a definite answer to enquiries. We quote the following from the report of the Devon and Exeter Society:—"But in view of the manner in which much of the building work is designed in this district, your Council feel strongly that some steps should be taken to safeguard the interests of not only the profession, but the public at large." The Council of the Society again offer a prize of one guinea (in books) for the best sheet of measured drawings submitted by an Articled Pupil Associate of their Society.

**Black Smoke Nuisance.** THIS important question cropped up in the House of Commons last Thursday, by Mr. Bartley asking the Secretary of State for the Home Department whether his attention had been called to the increasing quantity of smoke and fumes emitted from the pottery and drain-pipe works on the river nearly opposite the House, and whether he would take steps to require the owners of these works to consume their own smoke and not contaminate the neighbourhood with these fumes. Mr. Chaplain, in reply, said the Local Government Board had no control over the

owners of the works referred to, but he had communicated with the clerk to the Lambeth Vestry, in which parish the works are separated, and the Vestry were making daily observations with respect to the emission of smoke from manufacturing firms in the parish, and that three inspectors had been specially told off to report on the pottery works referred to. It is understood that large sums have been expended by the two pottery firms in altering their furnaces and appliances so as to minimise the smoke and fumes arising in the course of their manufacturing processes, and they have expressed their willingness to make any further alterations of a practical nature if any such can be suggested. This awakening of interest in clearing London to some extent of smoke is, we hope, a beginning of a better state of affairs. There is no reason why every manufacturing firm, hotel keeper, &c., in London should not almost completely consume their own smoke, and that, too, with economy to themselves, for there are several excellent devices on the market. We can hardly hope for much moderation yet awhile in domestic houses, but if the first part can be obtained London will become more pleasing to the lover of beauty and far more healthy.

#### Irish Antiquities.

THE Royal Society of Antiquaries of Ireland went for land excursions on the 28th, 29th, and 30th ult., to enable members from England, Wales, and the South to see some of the beauties of the northern parts of Ireland and the Boyne Valley. On the 28th ult. there was a drive to the Giant's Ring which was continued back to Belfast, thence to Whiteabbey, and round by Carnmoney and Antrim Road to town again. On the occasion of this excursion a presentation of silver plate was made to Mr. R. Cochrane, the hon. sec. of the Society, and Mr. S. F. Milligan, hon. sec. for Ulster. On the 29th ult. the members visited Portrush, Dunluce and the Causeway. On the 30th ult. a party of eighty members visited Drogheda, where they first examined the obelisk which marks the spot where Duke Schomberg fell. They next crossed the River Mattock, a tributary of the Boyne, separating County Louth from Meath, objects of interest being pointed out on the way. Having crossed the river the party entered the subterranean chambers of the Tumulus of Dowth, the ancient burial mound of Irish pagan kings. Further on they reached the great pyramid or Tumulus of New Grange; a mass of stones 80ft. in height and 180,000 tons in weight on a base of two acres. The interior is tunnelled by a passage 80ft. in length, and has a central chamber 20ft. in diameter and 20ft. in height, with three small chambers off it, one ahead and the others to the right and the left. The ground plan forms a cross, of which the entrance passage is the shaft. The stones in the interior are carved with spirals, circles and various other carvings of the most remote times. The age of the tumulus must be about 3,000 years. On the outside there are eleven huge monoliths still in position, and many others which have fallen. These formerly formed a complete circle around the mound. They next drove to Monasterboice, an ancient Irish monastery founded in the middle of the sixth century. The ruins, situated in a graveyard, consist of three great sculptured crosses, a round tower, 110ft. high, and some remains of the ancient church. The round tower is one of the highest, and two of the crosses are the finest in the world. They next drove on to the ruins of Mellifont Abbey, a Cistercian foundation of the year 1142. The party then returned to Drogheda, where they visited various places of interest in the old town, including St. Lawrence's Gate and St. Peter's Church and cemetery, in which are some remarkable tombs. The new Roman Catholic Chapel, a very fine piece of Gothic architecture, which has just been completed, was also visited and its fine altar noticed. The members returned by rail to Belfast, objects of interest being pointed out on the journey, thus concluding the finest and most successful antiquarian outing that has been held in Ireland. The outing commenced

on the 20th ult. and concluded on the 30th, including, besides the land excursions, a sea cruise.

### Archaeological Discoveries at Longforgan Church.

THE whole of the interior of this church is to be reconstructed and altered, for which Mr. Alex. Hutcheson, of Dundee, is the architect. An apse with a three-light window has been erected at the east wall, and the flooring has been entirely removed. It was while the flooring was being removed that the workmen unearthed a beautiful tombstone, lying face upwards, near the supposed site of the altar in the old pre-Reformation church. The slab is an oblong block of Kingoodie stone. It bears full-length effigies of a knight in armour and a lady; there is also the figure of a small youth in armour, probably the knight's son or esquire. The knight and his lady are both portrayed with their hands devoutly folded, and faces turned towards the figure of St. Andrew on the cross, which is in the centre of the upper part of the slab. The plate armour on both knight and esquire, the lady's garments and the floriated back ground have been

WELLS  
COTTAGE HOSPITAL

COTTAGE HOSPITAL, WELLS, SOMERSET. W. J. WILLCOX, ARCHITECT.

so carefully executed by the sculptor that the minutest details are plainly delineated. Fragments of the ancient baptismal font have also been found in the tower staircase. Apparently it had been an octagonal basin mounted on a shaft, with eight panels around the sides giving sculptured representations of incidents in the life of Christ. The fragments preserved show Christ bearing the Cross, the Scourging, the Crucifixion, the Entombment, the Return from Hades and the Resurrection. There are traces of colour still left which show that at one time it was painted artistically. A fragment of what is supposed to be the capstone of one of the gables of the old church has a rose carved in high relief, surmounted by a gable and fleur-de-lys.

**A New Church at Great Lever, Bolton,** is to be erected to provide accommodation for about 700 persons. The foundation stone was laid last Wednesday by the Bishop of Manchester. There will also be a new school and parsonage house. The style of the church is decorated late Gothic. The school is placed behind the church, and is a two-storey building on the central hall system, with class rooms at each side. It will accommodate about 450, but is arranged for future extension to about 650. The parsonage will be in the vicinity. The contract for the buildings has been let to Mr. William Townson, of Bolton, and the works are being carried out from the designs and under the superintendence of Mr. R. Knill Freeman, of Bolton and Manchester.

## Professional Practice.

**Bangor.**—Two additional Homes of Rest were opened here recently. They have been erected at a cost of about £1,900. The general design of the exterior of the Home for Males is of red brick for the lower part and rough-cast decoration on the upper part of the building, with slate roofs, large windows and bays. Entering on the main vestibule there is a large octagonal hall leading to the main departments of the building, and with an open grate at the opposite end of the vestibule. On the right of the entrance are cloak-rooms, superintendent's office, and a large dining-room. From the dining-room there are French casements and a covered verandah. The servery leads from the dining-room to the kitchen and domestic offices of the building. On the opposite wing of the central hall there is a corresponding-room for the general sitting-room, with a large bay commanding a very extensive view. The upper floors are fitted up with a large number of bedrooms, some single and others double. Ample bathrooms and lavatory accommodation have been provided on each floor. The design for

**Edinburgh.**—In the Second Division of the Court of Session, last Wednesday, before the Lord Justice Clerk, Lords Young, Trayner and Moncrief, judgment was given in a re-claiming note for the defendant in an action by Mary Hope Jamieson, residing at Rosefield Cottage, Cargill Terrace, Wardie, Edinburgh, against Frank Worthington Simon, architect of 31, Hanover Street, Edinburgh, in which the plaintiff sued for £80 as damages for breach of contract, in respect, as alleged, that the defendant, who was architect of a house which the plaintiff erected in 1895 did not exercise sufficient supervision over the tradesmen, with the result that improper materials were used, the work of bottoming the concrete floor of the scullery being scamped. The bottoming consisted partly of chips of stone and partly of shavings, pieces of wood plaster, sacking, and general sweepings. The consequence was dry rot set in and cost £30 to eradicate. Lord Kyllachy, in the Outer House, found the defendant was liable, and he gave decree for £40 and expenses. Their lordships of the Second Division unanimously affirmed the decision, with additional expenses. Lord Young said the case was of importance to architects and their employers. It was important that they should know what were their respective obligations and rights. These did not seem to be agreed upon at present, for there was a conflict of evidence as to what they were. By his contract with the plaintiff the defendant undertook to prepare the plans and specifications, and supervise the work from commencement to completion, at a remuneration of 5 per cent. upon the cost of the work. One or other of the tradesmen scamped the work of bottoming, and, when the dry rot appeared, the defendant repudiated responsibility for the work, on the ground that his duty was fulfilled if he occasionally went to the place where the work was going on and took a glance round, and if he saw nothing wrong then there was no responsibility on him, and that he was quite acting according to his duty to his employer in not seeing to the bottoming of that scullery floor. His Lordship thought the legitimate interests of the employer required a good deal more attention than the defendant and some of the witnesses of his own profession seemed to think. The supervision must be such as would cover the work complained of here. It was not expected that architects should personally supervise the work; it was work which their servants could do. His Lordship was not without some sympathy for the architect in this case, arising out of what appeared to be the opinion of at least some of his brothers that there was no obligation to do more than he did; but the Court must construe the contract in the way he had indicated.

**Leith.**—The public baths which have been erected in Great Junction Street by the Corporation of Leith, in completion of the scheme inaugurated in celebration of Her Majesty's Jubilee, are now ready for use and the formal opening recently took place. The total cost of the building, including the registrar's office, which occupies a portion of the site, is about £12,000. The external elevation is of red sandstone, and is of a classic character. The swimming bath is 75ft. by 35ft., with a depth of 7ft. at the deep end and 3ft. at the shallow end, and is flanked on each side with dressing-boxes, of which there are about sixty, with a spectators' gallery overhead. The design, although simple, is effective and attractive. Trapeze, swing rings, shoot and diving platform have been erected. Electric light is used throughout. Wave and spray arrangements have also been introduced, the former being utilised as a scummer, and the latter for ventilation, produced by the spray of cold water cooling the atmosphere. The usual accessories have been introduced, namely, douche and foot baths, lavatory, office and waiting room. Seven plunge baths have also been provided, and there is, besides, a billiard-room with accommodation for two tables. The baths have access from the main entrance and from Corunna Place off Bonnington Road. It is anticipated that in the winter months when the weather

the Home of Rest for Mothers and Children is based on a similar plan, but to a somewhat larger scale, the main sitting-room and dining-room being each about 35ft. long by 17ft. wide, with large bays. In addition, a special feature of this building is a large upper verandah around the bedrooms, specially adapted for mothers with children in arms. The architect was Mr. W. J. Roome, and the builder Mr. James Kidd.

**Bristol.**—The new offices of the Prudential Assurance Company, Limited, will occupy the site at the corner of Clare Street and St. Stephen's Avenue on which the old buildings stood. As is customary with the offices of the Company, the lower part of the elevations will be of red Aberdeen granite, and the upper part of red terra-cotta, with red bricks sparingly introduced. All the fireplaces in the building will be gathered into one central stack. The three elevations will be treated with equal care. There will be two angle turrets to the St. Stephen's Avenue front, with grouped windows surmounted by a gable between the turrets, and similar gables will relieve the other elevations. The one entrance will be in Clare Street, near the upper end of the building. The Company's offices will occupy the ground floor, and the first and second floors will contain admirably lighted and appointed offices for tenants. The new building has been designed by Messrs. Alfred Waterhouse and Son; Messrs. Cowlin and Son are the builders, and Mr. W. Brock is clerk of works.

is too severe for bathing, the water may be run off and the area of the bath used as a public hall. A novel system of heating has been introduced: the baths adjoin the electric light station, and the exhaust steam from the engines thereof, which is ordinarily discharged into the atmosphere, has been utilised for the heating of the swimming pond for the domestic hot water supply, and by means of pipes for heating the whole premises, thus doing away with the necessity for a boiler and other expensive arrangements, as also for a continuous attendance of stokers and firemen. The whole place is constructed so that it may be in compliance with the Act of Parliament applying to public halls. As a swimming bath it holds from 500 to 600, and as a public hall it will hold from 1,000 to 1,500 persons. Messrs. Kinnear, Moodie and Co. were contractors for the mason work, Messrs. J. and D. Sutherland for the carpenter and joiner work, Mr. T. Macpherson for the plumber work, and Messrs. Field and Allan did the tiling work. The whole of the work has been executed under the superintendence, and from the designs, of Mr. George Simpson, town architect.

**Llandaff.**—The two central lights of the western windows of Llandaff Cathedral have been filled with stained glass, and were recently unveiled and dedicated. The design of the large central light represents as its main subject Our Lord sitting in glory and robed as priest and king, ruling over the world, with His right hand spread out in the attitude of invitation, whilst His left hand holds the regal orb, surmounted by the Cross, as the symbol of His Divine rule. He is seated on the great white throne, whilst behind Him is the rainbow, the symbol of reconciliation to mankind. Above are two angels in the attitude of adoration, whilst at the top of all is shown the Holy Spirit as a dove. Below are two other angels of the Judgment, one holding the sword and the other the trumpet, ready to sound as described in the Book of Revelation. In the lowest panel is represented Dean Conybeare, to whom the light is a memorial, in a kneeling posture at a desk, upon which is a Book opened before him at Psalms 7, verse 1, whilst an inscription to his memory completes the picture. The upper light represents the angel of the everlasting Gospel as described in Rev. xiv., 6, proclaiming from mid heaven the Divine message to the whole world. Messrs. Powell and J. P. Seddon, of London, are the respective artists of the lower and upper lights.

**Wells, Somerset.**—The Cottage Hospital at Wells, Somerset, of which we give an illustration on opposite page, was erected in 1895 at a cost of about £1,800 from the designs of Mr. W. J. Willcox, architect, of Bath, who was successful in obtaining the first award in a competition limited to six architects invited to submit designs. The elevation is in a free Renaissance style of a simple character, built in local stone with freestone dressings, and the accompanying plans sufficiently show the arrangement of the interior, which is designed for twelve patients, to meet the needs of a small town in an agricultural district with less than a few large factories in the neighbourhood. Mr. Charles Wibley, of Bath, was the builder.

## New Company.

An issue of importance has been made this week. The Cattewater (Plymouth) is to be developed by a company under the name of the Plymouth Wharves, Limited. The Admiralty, Board of Trade, and the Cattewater Commissioners have approved the scheme, whilst a special Act of Parliament has been obtained for working the wharves. From the particulars placed before us we anticipate a widespread interest in the flotation, as it should inaugurate a development of great value to Plymouth and the west of England generally. A very influential Board of directors has been formed, and investors should carefully peruse the prospectus, which will be found on one of our advertisement pages.

## NEW TOWN HALL AT CAPE TOWN.

A FINE new Town Hall in the Italian Renaissance style is to be erected at Cape Town to take the place of the present rambling townhouse which has been the home of the Corporation of this ever growing South African city for many years. The old building has become too small for the increasing official staff, and the Town Council has resolved to build a hall which will be large enough for all requirements. The site that has been fixed upon is a spacious quadrangle inclosed by Darling, Zecke, Longmarket, and Parade streets, now occupied by the market buildings. These will be demolished, and their place occupied by the new structure, designed by Messrs. Reid and Green, architects, of Adderley Street. The front elevation of the new building will be towards the Grand Parade, and from the centre of the three floor frontage a handsome tower, with clock and belfry, will rise to a height of 200ft. The main building will measure 280ft. by 175ft.; its floors on the Darling Street side will be 80ft. high to the cornice, and the remainder of the frontages will be 60ft. high.

In connection with that part of the building set apart for public purposes will be a vast hall, 130ft. by 62ft., and 55ft. high. This is to be entered by means of a portico outside the entrance hall, which will have several niches recessed in the solid masonry walls for statuary. The reception hall, 46ft. by 40ft., with corridors 13ft. broad at each side, will come next; then an inner hall; and, finally, immediate entrance to a large city hall, which has been especially designed with a view to holding musical festivals, citizens' meetings, &c. It will possess a public gallery and an orchestra gallery, each seating 300 persons. The orchestra gallery is to be semi-circular in form, and will be situated at the south end of the hall. The total seating accommodation in the hall will be for 2,000 persons. The dimensions of this block for public functions will be 225ft. in length and 86ft. in breadth. Cloak-room and other accommodation will be provided. Access will be gained to the municipal offices from the Darling Street entrance by means of the central-winged granite staircase, with massive balustrading and carved stone portico, whose red marble columns will support the council chambers balcony overhead. Entrance halls are also to be provided at pavement level.

The ground floor suite of offices will consist of the muniment room, the treasurer's department, the general office, accountants' and private offices, offices for the sanitary superintendent and medical officer of health, and the waterworks and drainage departments, with strong-rooms and separate suites of lavatories for each set of offices. The main central staircase to the first floor will begin with a width of 28ft. in the entrance hall facing Darling Street; the wall-faces are panelled and recessed, and richly ornamented with semi-circular headed moulded architraves, imposts, and pedestals, grouped together. It is proposed to construct the "treads" of this staircase in marble, with solid marble strings, turned balustrades, and moulded coping, designed in effective colours and polished surfaces.

The council chamber, on the second floor, will be 56ft. long, 31ft. wide, and 32ft. high, with a coved and decorated ceiling and cornice. Round the walls, to a height of 8ft., panelled wainscoting is intended to be fixed, and overhead, at an elevation of 11ft., will be the Press gallery. Accommodation for the public is to be provided, set back from the interior of the chamber proper. Close by will be the banquetting hall, 63ft. by 39ft., the councillors' library, 42ft. by 39ft., rooms for committees and the reception of deputations, a robing-room, and lavatories. Lifts are to be provided from the kitchen, and on occasion the banquetting hall will be approached by a staircase from the "public" section. On the top storey the city engineer's department will have a studio for working the ferro-gallic process and printing from plans and drawings.

## WELL-DESIGNED FURNITURE.

IT is rarely indeed that we receive a trade catalogue that is so pleasant to handle, to look upon and to read as one that has lately come to hand from Messrs. Heal and Son, of Tottenham Court Road, W. Perhaps the term "trade catalogue" is hardly applicable to this attractive little brochure on "Simple Bedroom Furniture," which, notwithstanding its recommendation of a particular manufacturer's wares, has a genuine literary and artistic interest of its own. The illustrations are woodcuts from original designs by Mr. Ambrose Heal, and represent a style of furniture very far removed from the tawdry vulgarity one has been accustomed—not quite fairly perhaps—to associate with Tottenham Court Road. Simplicity, good proportion, good workmanship and the suitable use of materials, are its prevailing characteristics. Included in the book is an essay by the late Mr. Gleeson White on "Simplicity of Design in Furniture for Bedrooms," in the course of which it is pointed out that Messrs. Heal's furniture will accord with almost any style of interior decoration that a first-rate architect would approve of. Mr. White also notes the curious fact that good design always begets good workmanship. "If the design is all right, both constructionally as well as æsthetically, the workmanship is nearly sure to be good also. For it offers a workman real interest in his craft to find that joinery and good framing are relied upon for such beauty as the structure possesses. If it is to be smothered with cheap ornament he may be tempted to shirk his part; but, given the opportunity, many a skilled mechanic will provide work to-day with as good a finish as that which in the Chippendale, and other furniture of the Adams period, still delights us." There is much sound wisdom in this essay, which is well worth reading and preserving. Mr. White had no sympathy with attempts to escape from conventionality in design by resorting to the eccentric and the grotesque. "Where rigid simplicity is obeyed," he says, "it can never become an eyesore. As the pattern we welcome on walls, floors, and ceilings, provides enough, and more than enough, ornament for any room, it is best that the furniture therein, especially when it is purely utilitarian (as bedroom fittings must needs be) should be not only without decoration that would jar upon the rest, but in its simply ordered fashion provide actual beauty. For beauty does not reside in ornament only; nor even, as some people in their effort to escape 'prettiness' have fancied, need it take refuge in unmitigated ugliness. The terrible efforts to escape the prevailing fashion, be it what it may, by uncouth and grim affectations, is but an inverted recognition of the 'mode' being all-important. The really valuable work of any period is that which does not assert itself, but takes its place in the scheme of the abode." It is possible that furniture of the kind which Mr. Gleeson White approved and which Messrs. Heal and Son manufacture, may not be the most widely popular; nevertheless, there is, we hope, a sufficiently large section of the public who do appreciate good taste in furniture design to make it worth while for Messrs. Heal and Son to continue on the artistic lines on which they are now working.

**Paisley Church Council's New Buildings** have been erected at a cost of about £6,500, from plans by Mr. T. G. Abercrombie, of Paisley. They are in free Renaissance style, and the hewn work is of red freestone from Lochaberbriggs quarry. The back elevation is of grey freestone from Auchenclea.

**New Hospital at Liscard.**—The foundation stone has been laid of the new Central Hospital by Mrs. McInnes, of Wallasey. The new building will cost £15,000, and will consist of three pavilions capable of accommodating 120 beds. There will be a fully equipped operating theatre, and the administrative block will house the whole staff. Messrs. Maxwell and Tuke, of Manchester, are the architects.

## Keystones.

**A New Memorial Window** of painted glass has been erected in St. James' Church, Bury. Messrs. Clayton and Bell were the artists.

**The Foundations of the New Union Baptist Sunday School**, Windon-street, Blackpool, were laid last Wednesday. The building is to cost over £1,700.

**A Gable Collapsed** recently at Templeford, Ect, while a number of masons were engaged in taking it down. A young labourer named William Mutch was killed.

**The Monument to Schumann**, which is to be erected at Zwickau, Saxony, will be unveiled on July 8th, 1901. It will cost about 30,000 marks.

**The Roof of the Foundry** fell in at Messrs. Shaw's works at Middlesborough last week, and killed a man named Charles Adams. Five other men were injured.

**The New Granary at Avonmouth Dock**, Bristol, will have a capacity of 70,000 quarters, and will cost about £65,000. Mr. C. A. Hayes is the contractor for its erection.

**A New Font** was dedicated recently at St. Giles' Church, Newcastle-under-Lyme, by the Bishop of Shrewsbury. Mr. Robert Bridgeman, of Lichfield, executed the work from designs by Mr. John Lewis, architect.

**Alterations to the Goods' Offices and Warehouses** are to be carried out at the Kirkgate Railway Station, Wakefield. The tender of Messrs. Leake and Sons, of Norman, estimates the cost at about £7,000.

**The Dean Vaughan Memorial Church**.—The foundation stone of this church was laid by the Princess Henry of Battenberg, acting on behalf of the Queen, last Friday. The cost of the church will be about £8,980.

**A Fire on a Builder's Premises**.—A store building and a greenhouse belonging to Mr. H. C. Faulks, builder, of Carysfort Road, Stoke Newington, were recently destroyed by fire. Several trees near at hand were also damaged considerably.

**New Gardeners' Lodge at Stratford Hospital**.—At a special meeting of the Court of Governors, held at Stratford-on-Avon Hospital last Wednesday, it was resolved that £860 should be appropriated from the capital fund for the purpose of building a gardeners' lodge and other work; £500 is to be spent on the lodge.

**A New Church Institute**, which has been built at a cost of about £2,000, was dedicated recently at Malvern.

**A New Mission Hall at Keighley** was opened recently. It has been erected by the Wesleyan Methodists of that town, and has cost about £2,650, of which over £400 has yet to be raised.

**A Statue of Johann Anthony van Riebeeck** was unveiled at Cape Town recently by the Mayor. The statue is the present of Mr. Cecil Rhodes. Van Riebeeck was the Dutch founder of the town.

**The Memorial to Archbishop Benson** in Canterbury Cathedral was unveiled last week by the Duchess of Albany. The memorial was designed by Mr. Henry Jackson, R.A., and sculptured by Mr. T. Brock, R.A.

**Wollaston Hall, Stourbridge**, a well-known old and picturesque mansion, has been sold, with the estate of 20 acres upon which it stands, to Mr. Caleb Roberts, of the firm of Messrs. Roberts and Cooper, for £4,300.

**A New Church for Keighley**.—It has been decided to erect a new church for the district of All Saints', Keighley, at a cost of about £3,000, towards which the Duke of Devonshire has promised a donation of £800.

**A Substantially-built Lattice Bridge**, over the Black Devon at Riccarton, erected by the Clackmannan County Council, was formally opened last week. Mr. R. Melvin, of Sunny-side Foundry, Alloa, was the contractor for its erection.

**A New Church at Cornaig, Tiree**, has been erected for the Rev. Mr. MacPherson, the parish minister. The church, which is Gothic in style, was designed by Mr. Fletcher, of Mull, and erected by Mr. Donald Mac Donald, contractor, of Coalis.

**The Palais du Maréorama Hugo d'Alesi** is now being erected in Paris, at the corner of the Avenue Suffren and the Quai d'Orsay. It is designed in Oriental style, and is being erected for the Société du Maréorama. The building will display views in Tunis, Algiers, Naples and Venice, by the celebrated painter, Hugo d'Alesi.

**Proposed New Poorhouse at Aberdeen**.—The Works Committee of the City Parish report that they have had under consideration the advisability of building a new poorhouse, or of making either of the present poorhouses suitable for the requirements of the parish, after the poor have been removed to the new asylum which is in the course of construction. The estimated cost of this scheme is £49,877.

**The New School at Larnick** is to be built from plans by Mr. Wilson, architect, of Edinburgh, and will cost £7,000.

**A New Town Hall** is to be erected at Ayr at a cost of £10,000. It will be remembered that the last building was destroyed by fire.

**The Victoria Tower, Huddersfield**, of which some particulars were given on page 330 of our issue dated July 5th, is 100ft. high and 27ft. square (not 20ft. square, as stated in our paragraph). We make this correction justice to the architect, Mr. Isaac Jones.

**Permission to Enlarge the Osborne Hotel, Bradford**, was applied for at the Bradford City Police Court, last Wednesday, by Mr. A. Neill on behalf of the owners of the hotel. The enlargement consists of additional bedrooms. It was stated that the application would be granted.

**Three Painters fell from a Scaffolding** at Leith last week. While they were cleaning a staircase in Easter Road one of the ladders supporting the scaffolding slipped, and the three men, John Kerr, David Marr and John Nicholson, fell a distance of 15ft. Kerr and Marr, who were badly hurt, were conveyed to the hospital.

**The Illustration of the New King's College Buildings**, published on p. 348 of our last week's issue, was reproduced by kind permission of the Editor of the "Westminster Gazette," in whose paper it originally appeared. We regret that this acknowledgment was inadvertently omitted from our paragraph last week.

**The Suitability of High Hazels Hall for use as a Museum** has caused some friction between the members of the Attercliffe General Purposes and Parks Committee and the Free Libraries and Museum Committee, who met recently to consider a report on the subject proposed by some members of the latter committee. This report describes the building, which is a substantial stone structure, and states that if used for museum purposes the partition walls of the bedrooms could be pulled down and would make three good-sized rooms. The building, they considered, had an appearance not unworthy of an art museum. A resolution that it was undesirable to convert the hall into a museum was lost, and an amendment instructing the City Surveyor to report (1) as to the costs of the alterations outlined in the report, (2) the cost of maintenance and support, and (3) the estimated cost of erecting a new museum, was carried by twelve votes to eight.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Half-yearly Meeting of Members. 8 p.m.

Thursday, July 20.

BUILDERS' BENEVOLENT INSTITUTION.—General annual meeting and election of officers, at 3 p.m.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

AYLESBURY.—Accepted for the erection of three villas Manor-park, Aylesbury. Guest Luckett, architect, Aylesbury.

C. Powell ... .. £1,050

AYLESBURY.—Accepted for the erection of a pair of small villas, Manor-park. Guest Luckett, architect, Aylesbury.

F. Nash ... .. £570  
BRISTOL.—For alterations of and additions to factory and premises, Gloucester-street, St. Paul's, Bristol, for Messrs. H. O. Strong and Co., engineers, &c. Messrs. W. Holbrow and Sons, surveyors, 9, Clare-street, Bristol:—  
Wilkins and Gosling ... .. £1,408  
W. Foster ... .. 1,395  
C. W. Foster ... .. 1,395  
C. Walters ... .. 1,120  
F. Hatherly ... .. 1,285

BURGH S. MARGARET (Norfolk).—For the restoration to church tower. Herbert J. Green, architect, 31, Castle-meadow, Norwich:—  
H. Whitehead ... .. £693 7 4  
A. A. Beech ... .. 690 0 4  
R. W. Riches ... .. 645 0

DOWLAIS (S. Wales).—For the erection of a swimming bath, penny baths, laundry, &c. (exclusive of engineering work and steel roof trusses) for the use of the employees of the Dowlais Iron Company, for the Right Hon. Lord Wymborne Mr. R. Owen Allsop, architect, 37, Norfolk-street, Strand London:—  
Lathey and Co. ... .. £7,957 0  
Shepton and Son ... .. 5,317 18  
J. Linton ... .. 4,600 0

HOOK-NORTON.—Accepted for the erection of a house Guest Luckett, architect, Aylesbury:—  
W. Luckett ... .. £350

KINGSTON-ON-THAMES.—For the erection of two shops in the London-road. Mr. E. F. Augustus Spratt, architect, 90 and 91, Queen-street, Cheapside, E.C., and Kingston-on-Thames:—  
Norbury and Co. ... .. £1,168  
J. P. W. Turner\* ... .. £1,000  
List ... .. 1,100

LONDON.—Rebuilding girls' and infants' offices, enlarging boys' offices, refitting laboratories, and providing new drainage complete at Sydenham Hill-road school, for the London School Board. Mr. T. J. Bailey, architect:—  
G. Parker ... .. £2,493 2 6  
Lathey Bros. ... .. 2,432 0 0  
J. & C. Bowyer ... .. 2,373 0 0  
Maxwell Bros., Ltd. ... .. 2,363 0 0  
H. Leney\* ... .. 1,707 0 0

LONDON, S.E.—For repairs to the Royal Hospital for Children and Women, Waterloo Bridge-road, Lambeth, S.E. Messrs. Waring and Nicholson, architects, 38, Parliament-street, S.W.:—  
Wm. Smith ... .. £110 10  
Higgs and Hill, Ltd. ... .. 106 16  
J. Mills, Junr.\* ... .. £103 10

LONDON.—For erecting a four story warehouse in Snowsfields, Bermondsey, for Mr. John Wilson. Mr. James Thomas Holmes, architect:—  
Barlow and Watts ... .. £2,353  
Battley, Sons and Holness ... .. 2,029  
J. Bullers ... .. £2,025  
B. Wells (accepted) ... .. 1,859

LOUGHBOROUGH (Leicestershire).—For alterations and extensions to the Corn Exchange, for Loughborough Corporation. Mr. A. H. Walker, C.E., Borough Surveyor, Town Offices, Loughborough. Quantities by surveyor:—  
Price ... .. £2,175 0 0  
Watson and Lovatt ... .. 2,110 0 0  
Tailby ... .. 1,983 1 6  
Moss ... .. 1,980 0 0  
Harding ... .. £1,980 0 0  
Main, Kendall, and Main, Loughboro\* ... .. £1,910 0 0

MILNE'S ANTI-DOWN DRAUGHT CHIMNEY TOP.

# HALL'S SANITARY WASHABLE DISTEMPER

## A New Sanitary Water Paint.

It is Cheaper, Healthier and more Artistic than wall paper, and covers twice the surface of oil paint.

MANUFACTURED BY

### SISSONS BROS. & Co., Ltd., HULL.

Samples, Shade Cards, and other particulars on application.

# Twyfords' "AXIS"

## WASH-DOWN PEDESTAL W.C. BASIN.

WITH  
DETACHABLE SCREW CONE BRASS  
JOINT AND LEAD CONNECTION,  
ALLOWING  
OUTLET OF TRAP TO BE PLACED  
AT ANY DESIRED ANGLE.

Embraces all the Requirements of the London County Council.

CONNECTION BETWEEN OUTLET OF BASIN AND LEAD  
BEND IS UNDER WATER.

HAS LARGE SURFACE OF WATER IN BASIN  
AND DEEP SEAL IN TRAP.

MADE IN  
EARTHENWARE,  
VITRINA WARE (Non-Absorbent),  
CANE WARE, and  
FIRE CLAY ENAMELLED.

**TWYFORDS LTD.,**  
**CLIFF VALE POTTERIES,**  
**HANLEY.**

MORLEY (Yorks).—Accepted for the erection of schools, Victoria-road, for the School Board. Messrs. T. A. Buttery and S. B. Birds, architects, Queen-street, Morley :—

Masonry.—Clegg and Son, Morley	£4,850 0 0
Joinery.—Newton and Asquith, Morley	1,870 0 0
Plumbing.—W. Naylor, Morley	650 0 0
Plastering.—E. Wilson, Morley	450 0 0
Slating.—Sharpe and Harper, Holbeck	715 0 0
Ironfoundry.—F. Thackray, Morley	402 3 3
Painting.—C. Habergham, Morley	106 0 0

QUANTON.—For the erection of six cottages, one house, and shop, for Mr. A. Curtis, of Ashendon. Mr. Guest-Luckett, architect, Aylesbury :—

Darlington	£2,050 0	Crook and Sons	£1,703 0
Grant	1,914 0	Matthews Bros.	1,628 0
Kimberley	1,800 0	Tombs and Sons	1,525 0
Sherwin	1,711 10	Cannon and King	1,498 0
Senior and Clarke	1,707 10	Holland and Sons*	1,490 0

\* Accepted.

REDHILL.—For the superstructure of three business premises, Station-road (but exclusive of terra-cotta and bricks). Mr. A. Broad, architect, 22, George-street, Croydon. Quantities by the architect :—

Buckland and Waters	£4,390	D. W. Barker	£3,883
C. Parsons	4,360	Akers and Co.	3,811
Nightingale and Sons	4,095	J. J. Carrick	3,780
Smith and Sons, Ltd.	3,982	Pink and Moon, Mers-	
Worsell and Martin	3,950	tham*	3,666

Stiff and Sons ... £160

Terra-cotta, Gibbs and Canning, Tamworth\* ... £145

\* Accepted.

SHEERNESS.—For the erection of a girls' school, for the Sheerness and Minster-in-Sheppy Board School. Mr. Leonard Grant, architect, Sittingbourne :—

G. E. Wollard	£7,956	H. E. Phillips	£6,990
J. E. Bligh	7,852	J. M. Easton	6,980
E. F. Hughes	7,458	West Bros.	6,871
Pavey and Sons	7,090	J. H. Harris, Chatham*	6,520

\* Accepted.

SIDCUP (Kent).—For erecting St. John's Church, Sidcup, Kent. Mr. George H. Fellowes Frynne, architect, 6, Queen Anne's Gate, Westminster. Quantities by Mr. R. Henry Hale, 33, Old Queen-street, Westminster; S. W. :—

Lawrence and Sons ... £13,150

Rider and Son ... 13,075

Dove Bros. ... 12,175

Stimpson and Co. ... 11,285

Holloway Bros. ... 11,087

J. Otway ... 11,033

Stephens, Bastow, & Co. ... 10,954

\* Accepted.

WINDOVER (Bucks).—For the erection of a villa residence, for Mr. F. W. Blake. Guest Luckett, architect, Aylesbury :—

Kimberley ... £950

Darlington ... 780

Mead ... 720

Mayne and Son ... 685

Holland ... 2,681

Senior and Clarke ... 870

Sherwin (accepted) ... 830

# CHEAP ROOFS AND COVERINGS.

BY G. S. MITCHELL, F.S.I.

FOR temporary works and for many purposes, such as shelter sheds for agricultural uses, sheds over pit mouths, in iron and brick works, and other business erections, and especially where large superficial areas are to be covered, it is essential that the capital outlay should be curtailed as much as is reasonably possible, though it is well also to bear in mind the question of after maintenance.

Cheapness of construction, if only attained with the certainty of great future cost of maintenance, ceases to be economy, though unfortunately it is only too frequently that one sees the question of initial outlay unduly studied and without any proper regard to the after expenditure. The material which occurs most naturally to the mind when considering a cheap roofing material is:—

Iron, usually corrugated and galvanised, and built "self-supporting" or as span roofs.

For many purposes, this is the most economical and durable material to be employed, though it is nevertheless subject to the following disadvantages:—

1. It is liable to be stripped by wind pressure from the inside, unless the sides be completely covered in.
  2. It is somewhat noisy during wind or rain.
  3. It is liable to become unpleasant by reason of the condensation of moisture on the under side.
  4. Buildings covered with it are hot in summer and cold in winter, and so are not entirely suitable for the housing of livestock.
- On the other hand iron is easily and quickly fixed, and is particularly useful in situations where the pitch is too flat for any other roof covering.

A ton of 22-gauge sheets (each of eight 3in. corrugations) consists of about 112 sheets of 6ft. length each, or a ton of 26-gauge would contain about 178 sheets of similar character. The price of 22-gauge being, say, £10 per ton, and of 26-gauge £11 5s., the comparative costs (allowing 3in. side laps and 4in. end laps) would work out at about 17s. 4d. per square (of 100ft. super.) for 22-gauge and 11s. 4d. for 26-gauge.

It should be noted that though sheets of extra length (say 9ft. or 10ft.) cost proportionately a little more than the more usually employed 6ft. or 7ft. lengths, they are yet economical in cases where it is safe to increase the distance between the roof purlins to a width sufficient to fit the longer sheet.

at about 24s. to 28s. each, according to size. Neither in the case of lights nor of ventilators is any other fixing needed than in the case of an ordinary sheet.

The cost of plain galvanised ridge capping may be taken at from 2d. to 5d. per foot according to its gauge and the width covered (usually 12in. to 18in.). Galvanised cone-headed screws will cost about 2s. 6d. per gross, and galvanised washers to suit about 8d. a gross, about 3lb. of screws being needed to every square of roofing.

Other inexpensive roofing materials are enumerated below:—

Felt, inodorous or otherwise, must be fixed on rough boarding (good quality costing about 13s. per square) by flat-headed nails, and with laps of about 2in. The whole should be well tarred after completion, a little lime being mixed (after sifting carefully) with the tar. The felt itself will cost about 4s. 9d. per square. It is not generally known that a slight leak in a felt roof may be remedied by tacking thick brown paper over the spot and tarring thoroughly.

Willenden Paper need not necessarily be laid on boards, but may be fixed by wood battens above, nailed through the paper into the rafters below at every lapped joint, the paper of course being laid up and down the roof. This material (4-ply) costs about 1s. 7d. per square yard, allowing for lap, and owes its economy to the saving in the timbers needed for the roof construction rather than to any cheapness of its own.

Glass is now a very inexpensive material, and were it not for the cost of the so frequently needed repainting and painting, this would form a very cheap roof covering; 26oz. British sheet glass may be obtained at from 3½d. per foot super. upwards, ½in. rolled plate from 2½d., and 21oz. foreign glass at as low as 1½d. per foot super. For the sake of economy, glass should be purchased in sheets of a standard size.

"Open," "Half," or "Chequer" Slating is sometimes employed for farm buildings or where special ventilation is required. The saving by this method is, of course, confined to the reduction in the quantity of slates and nails used—nearly one half—the battens or boards remaining the same as in ordinary close slating. In place of the slates in any particular course being butted close to one another they are spaced laterally in such a manner as to just cover the joint between the slates in the course below. Slating of this description is well adapted for use in farm buildings, covered yards, or anywhere where livestock is housed, as by its construction it affords a certain amount of ventilation, and it is neither hot nor cold, as is the case with iron roofs.

FIG. 2

which catch the rain and conduct it to the bottom of the board, may be either cut in the edge of the board in exactly the same way as in a grooved floor board (Fig. 1, a), or they may be cut on the upper surface and near the edges of the board (Fig. 1, b), either plan being equally efficacious in catching even driving rain.

The boards must not be placed with their edges closely butting, but should be fixed with a space between each of from ¼in. to ½in. width (modified according to the state of dryness of the boards when put on), and the whole should be well tarred outside. To make quite sure that no wet shall travel round the edge of the board, and so rot the wood underneath, small studs or nails with large projecting heads may be driven into each purlin, in order to prevent its actual contact with the roof board. A roof of this description may be built complete at a cost of from 5d. to 7d. per square foot of the horizontal area covered, the cost varying according to the size of the spans and the character of the work. It is worthy of note that with boards grooved in the edges, these grooves must be clean and true, as every splinter left causes a drip or forms a bridge to the next board, in either case destroying the weatherproof character of the work.

GABLE ENDS.—It is astonishing how few people realise how readily corrugated iron lends itself to the covering in of gables, and in point of fact, when properly painted (an operation which should be postponed a little on newly galvanised iron) this material has a much neater appearance when vertically fixed than it can possibly have upon the slope of a roof. Fig. 2 illustrates how easily and economically iron sheets may be utilised in such a position. The gable shown is of 16ft. width and 6ft. high. Four ordinary corrugated sheets only are employed, and when properly cut—as indicated by the dotted lines in the figure—the pieces a, b, c, and d, fit accurately in the positions a', b', c', and d', respectively, and no waste whatever is occasioned by the cutting.

The cost of covering such a gable is, then, as follows:—

Four 6ft. sheets at (say) 1s. 7d. each .....	s. d.
Cutting same at Works will cost about .....	6 4
	2 0
Total .....	8 4

or only about 1s. 8d. per square.

The operation of cutting should be performed at the Works where the sheets are made, as it is very slow and unsatisfactory work to cut them with a hammer and cold chisel, as must be done if they are not purchased specially cut to sketch.

In the case of larger gables than that illustrated, and when the altitude is greater than the length of a single sheet, a little more trouble must be taken in accurately setting out the sheets, but the same principle will be found to hold good in all cases where the angle of roof slope is equal on either side of the ridge.

(To be concluded.)

FIG. 1 (A).

FIG. 1 (B).

Scale 1 2 3 6 9 12 of Inches

FIG. 1 (A). SHOWING ROOFING BOARDS WITH SIDE GROOVES AND HALF-INCH SPACES.

FIG. 1 (B). SHOWING ROOFING BOARDS, WITH HALF-INCH GROOVES AT ABOUT HALF-INCH FROM THEIR EDGES AND UPON THE UPPER SURFACE.

Where there is sulphurous smoke, special carbonised corrugated iron sheets may be used, and are said to be very durable, though personally I have never used them. In many cases it pays to paint the underside of galvanised iron sheets, and so increase their durability. Should lights be needed in corrugated iron roofing, special sheets may be obtained for the purpose; the cost of a fixed light 36in. by 20in. inserted in a 6ft., 7ft., or 8ft. sheet of 22 gauge is about £1, and if made to open, another 5s. will cover the cost. Louvre ventilators may similarly be obtained

Weather boarding is a very convenient covering and one easily erected, and is much used in the country, where home-grown timber (such as Scots fir or poplar) is often practically valueless. Where the wind cannot penetrate inside, the roof timbers may be very slight to carry weather boarding. It should be well tarred or creosoted to protect it from the weather.

Grooved Boards form a very cheap, and for all practical purposes, weather-tight roof. They should be fixed with the slope of the roof and carried on purlins at sufficiently close intervals to prevent sagging. The grooves

**L.C.C. Loans.**—At the usual meeting last week of the London County Council, it was decided to lend the Wandsworth District Board £3,500 for improvement works; the Kensington Vestry £6,000 for street improvements; the Battersea Vestry £30,000 for the purchase of wharves; and the guardians of St. Saviour's Union £3,100 for the purchase of leasehold property.

## THE BUILDING TRADE DISPUTE.

THIS dispute is becoming wearisome with its seemingly never-ending hitches in the settlements which, when made, were thought to be perfectly satisfactory. Owing to some differences regarding the carrying-out of the recent agreement terminating the plasterers' lock-out, arrived at between the Master Builders' Association and the National Association of Operative Plasterers, the former have asked the plasterers to meet them to discuss the matter. The secretary of the plasterers' association, on behalf of the plasterers, wrote to the master builders that it would be necessary to submit their request to his executive council.

The representatives of the London Order of Bricklayers met the Yorkshire employers, last Thursday, in conference, to endeavour to come to a satisfactory settlement. The conference was presided over by Mr. W. Nicholson, and the discussion was characterised by a desire on both sides to come to a friendly settlement. As was expected, the celebrated manifesto issued by the employers on the eve of the county lock-out practically formed the basis of the conference.

It will be seen from the text of the proposed settlement that several of the clauses of the Yorkshire manifesto have been accepted. By the terms of settlement the masters state that they have secured recognition of the much-debated principle of freedom of employment. The men will return to work to their old situations, and at the old rate of wages, and one clause of the agreement binds them not to interfere with non-union men. The men would accept this clause the more readily from the fact that they have not, they state, indulged in undue interference with non-unionists in the past. The settlement embodies some of the findings of the plasterers' conference and some of the clauses of the Yorkshire manifesto, but it will be seen that it also evidences a give-and-take policy on the part of the parties to the conference. The provisional terms of the settlement are as follow:

Clause 1 of Yorkshire Manifesto. Rule adopted—"That no foreman shall be compelled to join a trade union, nor compelled to leave one." N.B.—"The definition of the word foreman is a man who is constantly in charge of work, and not continually laying bricks."

Clause 2 of Yorkshire Manifesto. Rule adopted—With reference to the alleged refusal of members of the Operative Bricklayers' Society to work with men who may not belong to a trade union, the members of the O.B.S. agree that they will only use reason and argument to induce non-unionists to join their Union; but if the employer can prove to the employer that certain workmen are defaulters (as defined by Rule 6, Clause 5, of the O.B.S.'s present rules), the employer shall see that such person objected to shall pay up all arrears due to his society or remove him. Such men or foremen who have left the society during the dispute, if they have paid up all arrears due to the society up to the time of leaving it, shall not be considered defaulters, and the men shall not refuse to work with them.

Clause 3 of Yorkshire Manifesto. Rule adopted—For the purpose of demarcation of work, joint committees shall be established in the different districts, equally representative of the employers and the mechanics, whose representation shall be equally divided amongst the different branches of the trade in question. These committees shall, as far and as soon as possible, draw up schedules of work which it is recognised belong to certain branches of the trade. To such committees shall be immediately referred all points of dispute as to demarcation, and the decision of the majority in each case shall be accepted as binding on both sides. Should they fail, however, to decide them, the matter shall be referred for settlement to a similarly constituted joint committee representative of the Yorkshire Federation and the Bricklayers' Central Society, whose decision shall be final, provided that the employers' representatives are bona fide employers of bricklayers direct. Pending such reference to the local committees, no strike or lock-out shall take place; but the decision of the employer shall be provisionally accepted as to who shall do the work, provided that preference shall be given to that branch of the trade which in practice has done the work before in that district, and provided that no preference be given on account of the payment of lower wages.

Clause 4 of Yorkshire Federation Manifesto does not apply to the Bricklayers' Society.

Clause 5 of Yorkshire Federation Manifesto. Rule adopted for Apprentices.—No employer shall employ more bricklayers' apprentices than is equal to one-fourth of the total number of operative bricklayers employed by him. All apprentices shall be legally bound for not less than five years, and to commence not later than sixteen years of age. N.B.—Recommendation that no employer engages any apprentices until he has been in business twelve months.

Clause 6 of Yorkshire Manifesto. Rule adopted for Conciliation Board.—In the event of a dispute arising on any job or works, the district officials of the Bricklayers' Society shall send written notice to the Local

Association of Master Builders, who shall inform them within forty-eight hours whether the said builder is a member of that body. If so, a strike shall not be sanctioned by the Bricklayers' Society until six clear working days have expired from the receipt of such notice, during which time the matter shall be considered by the employers and the representatives of the workmen, with a view to an amicable settlement.

Failing a local settlement, reference shall be made immediately to the Yorkshire Federation and the central committee of the operatives, and until five days have expired from the date of this reference no strike or lock-out shall be sanctioned either by the operatives or the Yorkshire Federation. The employers agree to suspend the work in dispute pending a settlement.

### CONDITIONS OF SETTLEMENT.

1. Men return to work at the old rate of wages or wages already agreed upon, and to return to their old masters.
2. All men returning to work must do so peaceably with the non-union men now employed, whether of their own trade or allied trades.

It is understood that the O.B.S. will have to submit the terms of settlement to their members for approval before work can be resumed. The vote will be taken as soon as possible.

The Leeds branch of the Amalgamated Society of Carpenters and Joiners adopted last week a resolution which can have no other effect than to accentuate the already somewhat strained character of the relations between employers and employed in the building trade. They have determined that unless the 25 per cent. lock-out by the Federated masters in the city is withdrawn on or before Friday, the 21st inst., they will themselves withdraw the remaining 75 per cent. on the following day, giving, of course, the usual two hours' notice. Out of a total membership of over 1,250 nearly 1,200 members were present when this resolution was made, and there was a majority of more than 1,000 for the resolution. The meeting was attended and addressed by two members of the Central Executive, but these gentlemen were present chiefly for the purpose of gauging the feeling of the Leeds members of the society.

## Engineering Notes.

**The Hammersmith Vestry is Borrowing** £30,000 from the London County Council for electric lighting purposes.

**The Warming of Myrtle Street Baptist Chapel, Liverpool,** has been very unsatisfactory for a long time, and Messrs. John King (Limited), engineers, of Liverpool, were recently instructed to put it in a satisfactory condition. The old apparatus has been entirely removed, and the church is being fitted with the Firm's latest improved hot water heating apparatus.

**Electric Lighting Project at Wigan.**—Mr. H. P. Boulnois recently held an inquiry on behalf of the Local Government Board into the application of the Wigan Corporation for sanction to borrow £90,000 for electric lighting purposes. After the usual formal evidence, the inquiry closed.

**The New Pier at Rock Ferry, Birkenhead,** was opened recently by the Mayor (Alderman J. T. Thompson). The pier is 791ft. 6in. long and 18ft. wide. The girders of the pier are constructed of steel supported on cast-iron columns 14in. diameter. The approach bridge between the pier and stage is 160ft. long and 10ft. wide, and is hinged at the top and bottom to rise and fall with the tide. The stage is 150ft. long by 32ft. wide, and is supported on ten detachable pontoons. The contract price was £14,785 7s. 5d. The old pay office buildings have been taken down and new building erected containing four turnstiles and a contractor's gate, the contractor for this work being Mr. Allen, of Birkenhead, and the amount of the contract £798 10s. Mr. David Barry was the resident inspector of the works. The works have been carried out under the direction of Sir John Wolfe Barry, K.C.B., and Mr. Charles Brownridge, C.E., borough engineer and surveyor of Birkenhead.

## Trade and Craft.

### A RISE IN BRISTLE BRUSHES.

Messrs. G. B. Kent and Sons, of 75, Farringdon Street, London, E.C., inform us that the terrible famine at present raging in Russia has had the effect of seriously diminishing the supply of bristles. They advise us that all orders for brushes made of bristles are subject to an advance of ten per cent., with a prospect of a still further advance in the future. They had fortunately bought a large supply of bristles before the rise became serious, and are able to accept at old rates all orders for prompt deliveries received on or before Saturday last. Orders received on Monday last are subject to the advance. Toilet, painting, household and stable brushes, whisk brooms and banisters advance ten per cent.; tooth brushes and bass brooms remain the same.

### AN AUTOMATIC SAW GUARD.

A saw guard is most necessary, apart from the humanitarian aspects, in view of the stringent provisions of the Workmen's Compensation Act; as is clearly shown by the large number of cases which have occurred recently. Messrs. George Couzens and Co., of 14, Tudor Road, Cardiff, are the makers of a new saw guard for the protection of sawyers against accident. There are many so-called saw guards on the market which require adjusting to suit each piece of timber, and are thus, in themselves, a constant source of danger. With Couzens' patent saw guard, no such adjustment is necessary, and any size of timber can be sawn the full depth of saw, or any smaller size, with perfect safety and absolute protection to the sawyer. The front portion of the saw guard moves away as the timber is pushed against it, and rides on the top of the wood being sawn, so that no part of the saw is uncovered at any time. The back guard is also very simple in action. The riving knife being secured to the arm forms an absolute protection and cannot get out of order. The guard can be fixed from the ceiling by a special iron bracket, where the saw bench is required to be clear, and the guard is light but very strong, with no spring to get out of order or nuts to get loose.

### THE "EMPRESS" SMOKE CURE.

Messrs. Ewart and Son, of 346, Euston Road, London, N.W., send us a price list of their "Empress" Smoke Cure revolving chimney top. This top is strongly made and provides a great advantage in having the spindle work in a cylinder always kept full of oil from a copper cup at the top of tube, as also is the brass bearing, supporting the spindle in position, thus avoiding friction. The perpendicular fans are placed at a sufficient distance to prevent soot from adhering, and give free exit to smoke, and a strong galvanised iron framework inside supports the centre, and is placed close enough to the revolving fans to clear soot by the revolution of the top. A strong wrought-iron plate is firmly fixed to the supporting frame to prevent the sweep's broom from damaging the oil vessel or spindle, or from knocking off the revolving fans. The fans are made of steel, well tinned to prevent rust, and are carefully enamelled over the tin; the other parts are made of stout galvanized iron, enamelled black. The parts are rivetted together and the whole is fireproof. The method by which this chimney-top acts so effectively is that the movable head, easily revolving in any wind, maintains a constant current of air in the tube, and steadies the current by gathering up and gradually distributing the force of sudden gusts of wind instead of allowing them to act directly upon the draught. The prices of the tops are from £1 5s. to £2 13s., and are made in five sizes, but any other size will be made to order.

**Mr. William Robertson,** senior partner of the firm of Robertson and Orchar, Ltd., engineers, of Wallace Foundry, Dundee, died at his residence, Balmore, Newport, last Tuesday week.

## Masters and Men.

**Galashiels Plumbers** are to receive an advance on their wages from 7½d. to 8d. per hour, on October 2nd next.

**Chester Builders' Labourers** resumed work last week. They struck a short time ago for an advance of ½d. per hour, but have accepted ¼d.

**Chester Master Plumbers**, in order to avoid a strike, have granted their employés an advance of ½d. per hour, and a slight alteration of the working hours in winter.

**The Operative Slaters in Dundee** have been granted an increase of ½d. per hour on their wages, to come into operation in September. The present rate is 8½d. per hour.

**The Extension to the Butler Street Schools, Liverpool**, is being warmed and ventilated by means of Shorland's patent Manchester Grates, supplied by Messrs. E. H. Sorland and Brother, of Manchester.

**Unsafe Scaffolding.**—Last Tuesday week, before the Lord Justice Clerk, Lords Young, Trayner, and Moncrief, in the Edinburgh Court of Session, counsel were heard in the adjustment of issues for trial by jury of an action appealed from the Sheriff Court at Glasgow by the plaintiff, John Walpole, labourer, of 121, Gairbraid Street, Maryhill, who sued Wm. Gordon, mason and builder, of 385, Great Western Road, Glasgow, for £150 at common law, or for £100 under the Employers' Liability Act, as damages for injuries. The defendant was contractor for the erection of a church in South Portland Street, Glasgow. On March 14th, 1898, the plaintiff was in his employment. In connection with the raising of a heavy pillar into position by means of a crane the plaintiff climbed up and tied the end of a rope to a scaffolding, and in coming down part of the support of the scaffold gave way, and he fell to the ground. His left ankle was broken and bruised. The defendant said it was no part of the plaintiff's duty to climb the scaffold, and that he was himself entirely to blame for the accident. The Court dismissed the action as at common law, but held it to be relevant under the Act, and they allowed an issue.

**An Appeal by a Railway Painter.**—In the Edinburgh Court of Session on the 11th inst., before the Lord President, Lords Adam, McLaren, and Kinnear, counsel were heard in a stated case under the Workmen's Compensation Act from the Sheriff Court of Dundee. The North British Railway Company were sued by the father, mother, and other relatives of John Barrett, railway painter, Dallfield Walk, Dundee, who was knocked down and killed by a train passing across the Tay Bridge while he was in the employment of the defendants. The Sheriff found that in respect of the limited dependence of the plaintiffs upon the deceased the full compensation allowed by the statute was not justly due. He, however, found the plaintiffs entitled jointly and severally to £75, and gave decree for that sum with expenses. The plaintiffs appealed, and the questions of law for the opinion of the court, as stated by Sheriff Substitute Campbell Smith, were: 1. Is the mother of a son, his father being alive, entitled, according to the law of Scotland, to sue his employers for damages or solatium in respect of his death? 2. Is it competent, under the Workmen's Compensation Act, to discern in favour of the father and mother of the deceased, jointly and severally, for a sum of compensation? 3. Were the father and mother of the deceased, or either of them, upon the facts found by the Sheriff Substitute, in part depending upon the earnings of their deceased son at the time of his death, within the meaning of the Workmen's Compensation Act? The Lord President thought the questions raised in the case were perfectly clear, and, the other judges concurring, the case was remitted to the sheriff to grant a decree for the sum of £75 in favour of the father alone.

**A Mason's Labourer Loses a Compensation Case.**—In the Edinburgh Court of Session, on July 10th, before the Lord Justice Clerk and a jury, the trial took place of an action by Jas. Sally, mason's labourer, of 100, Hopehill, Glasgow, against Richard Dunbar, who carries on business at Elliot Street, Cranstonhill, and elsewhere, under the name of John Wallace and Company. The plaintiff sued for £500 as damages in respect of personal injuries. On August 26th last he was working on the floor of the first storey of new stables which the defendant was erecting in Elliot Street, when he fell to the ground, owing, it was said, to the unstable and defective nature of a wooden bed or centre. The defendant contended that the accident was entirely attributable to the plaintiff's negligence. The plaintiff was not in the employment of the defendant, who is the owner of the stables, but of a firm of contractors. He sued his employer in a former action, but the jury gave a verdict for the defendant. In this action against the owners of the building the jury were absent for half an hour, and on returning announced questions which had been put to them as follows:—Was the centre erected in a manner which is in practice in the trade by competent and experienced tradesmen?—Yes. Had the plaintiff proved that when constructed there was any detailed defect in the structure, and if so, what?—No. Did the plaintiff exercise reasonable care for his own safety in going on the centre?—No. Did the plaintiff or any of his fellow-workmen move any of the planking after it was laid?—Yes. Did the defendant make a reasonable inspection of the centre after it was constructed?—Yes. The verdict was a unanimous one for the defendant.

**A Penny a Week Damages.**—It will be remembered that in our issue of June 28th we reported a case in which compensation was claimed for a crushed finger, and in which nominal compensation at the rate of a penny a week was awarded to allow of the question of compensation being brought for review. Last Friday, in the Court of Appeal, Lords Justices A. L. Smith, Rigby and Vaughan-Williams heard the case of Chandler v. Thomas Smith, in which the same award was given. This was the appeal of the workman from an award of the county court judge, deciding that the workman was not entitled to claim compensation under the following circumstances:—Chandler had been for many years employed at £3 a week as foreman by the defendant, who carried on business as a mill owner, and his duty was to supervise the work of the weavers. He was not engaged to look after the machinery, but when anything went wrong with the looms he invariably attended to it, and, with his master's approval, did work which usually would require the services of an experienced fitter. It was while so engaged that the shuttle caught his thumb, nearly cutting it off. The applicant called evidence to show that if he had to seek a new situation the loss of his thumb would prevent him from applying for the post of foreman or general responsible man at a factory, as he could not now "adjust" or "set" the machines, and that his wages would then be probably less by £1 a week than, but for the loss of his thumb, he could otherwise obtain. The case was argued a month ago, and Lord Justice A. L. Smith, in now giving judgment, after referring to the facts, said the difficulty in the case arose from the finding of fact by the county court judge that the master had continued to pay the workman after the accident the same sum weekly, not as a matter of grace, but as wages, and there was no evidence that the workman could not have demanded full wages, less the time he was away at the surgery, for the services he had rendered his master. The other Lords Justices agreed with him that the master was liable, but they thought that as no pecuniary loss had accrued to the workman so far the county court judge should merely find the master liable, and directed nominal damages of 1d. a week to be paid to the workman in order to keep the award alive, so that should loss accrue in the future to him he might apply to have the damages assessed.

## Builders' Notes.

**Collapse of a Wall at Montifieth.**—A serious accident occurred last week in connection with the construction of a house, which resulted in the death of one man and severe injuries to three others. The mason work of a semi-detached cottage in course of erection in Hill Street was in an advanced state, and a brick partition between the dwellings had just been completed when the accident occurred. The work of removing the scaffolding was being proceeded with, and the upper stage had been taken down. Two men were engaged at the removal of the lower platform, one being on the top of the front wall and the other at the base of the partition. A few yards distant two masons—John Butchart, living in Broughty Ferry, and George Archibald, Maule Street, Montifieth—were preparing the ground for the laying of the ground floor joists; while William Millar, Wellbank, and George McGillvray, Dundee, the master mason and master joiner respectively, stood conversing near at hand. Without warning, several yards of the top of the brick wall fell with a crash into the east half of the building, carrying with it a number of the joists and the remainder of the scaffolding, while the centre of the wall was driven out towards the western section of the building. The workman on the top of the wall succeeded in retaining his hold, and the man below, recognising his danger, managed to jump aside, but had no time to give the alarm to the others. Butchart and Archibald were caught in the fall of bricks, which also struck McGillvray and Millar. When they were extricated, it was found that they were all more or less injured. Butchart, on examination, was found to be suffering from fracture of the skull and other injuries, and died soon after he was removed to Dundee Royal Infirmary. It seems that he has been very unfortunate, having three times previously met with serious accidents while working.

**L.C.C. Building Regulations.**—At the Surveyors' Institution, Westminster, last Monday week, a tribunal of appeal, consisting of Mr. Arthur Cates (Chairman), Mr. J. W. Penfold, and Mr. A. A. Hudson heard the appeal of Mr. R. H. Barnes, the owner of property in York Road, Lambeth, against the refusal of the Building Committee of the London County Council to pass his plans for rebuilding his premises. Mr. Stuart Bevan, instructed by Mr. A. Orgill, represented the appellant, and Mr. Seymour Berry appeared for the London County Council. From the opening statement of counsel it appeared that the appellant is the owner of the lease of 54 and 56, York Road, Lambeth, the property of the Ecclesiastical Commissioners. No. 56 is at present a public-house, and the appellant proposed to pull down both properties and rebuild them as licensed premises. In April last he instructed Mr. Robert Sawyers, F.R.I.B.A., to draw out plans, which were submitted to the local surveyor, and at his invitation sent to the London County Council. These plans were declined by Mr. Wyatt, acting for the County Council; and accordingly amended plans were sent in, which were no more successful. It was against the refusal of the Council to pass these amended plans that the appeal, under sections 41 and 42 of the Building Act, was made. The premises had a frontage of 54ft. to York Road, and a return frontage of 40ft. to Vine Street, on which it was proposed to build a large dining-room which would be a great convenience to the district. They had provided an open space of 150ft., which was all they were legally required to do. The licensing justices had considered the plans and had agreed to sanction the scheme.—Mr. Seymour Berry, for the London County Council, urged that the appellant should so modify his plans as to give an equivalent air space to that at present existing.—The Chairman said the members of the tribunal, having viewed the premises, thought they might rightly and properly allow the appeal. They made no order as to costs.

**Subsidence of Land caused by Morecambe Revolving Tower.**—Three double actions were entered recently against the proprietors of the Morecambe Revolving Tower, erected by Mr. Warwick, the inventor, in 1898, on land adjoining the Highfield Estate and the west end of Morecambe. These actions came before Mr. Justice Wills and a special jury at the Lancaster Assizes. Damages, amounting in the aggregate to about £1,340, were claimed in consequence of dilapidations to lodging houses in the vicinity of the tower, the weight of which, about 600 tons, is alleged to have caused a subsidence of the ground and rendered the walls unstable. The landlord and tenant were plaintiffs in two instances, and in addition to damages for necessary repairs, the owners, in the other case, claimed for depreciation in the value of the property, and also sought an injunction to compel the company from working the tower to the injury of their property. The jury returned a verdict for the plaintiffs, awarding damages amounting to £784.

**West Bromwich Public Improvements.**—Last Tuesday week Col. W. R. Slack, R.E., held an inquiry into the application by the West Bromwich Corporation to the Local Government Board for sanction to borrow £1,671 to defray the cost of enlarging the public baths, £878 to meet the outlay on the Hill Top Police Station, £131 for the Hill Top Park, and £84 for the Oak House Museum. Mr. A. Caddick, the Town Clerk, explained that the money was required because the amounts originally sanctioned had been exceeded, owing to increased cost of materials and labour.

**A Summons under the Building Act.**—At the Penge Police-court last week, Mr. Collman, solicitor to the London County Council, applied for four summonses against the Crystal Palace Company for erecting buildings near the polo ground at the Palace, belonging to the Company, without first obtaining the Council's permission, under the London Building Act. He said the Palace Company claimed an exemption under their special Act of Parliament, and that point would have to be decided when the case came before the Court. The Bench granted the summonses.

Surveying and Sanitary Notes.

**Sewage Disposal at Chesterfield.**—A Local Government Board inquiry was held at the Municipal Hall, last week, with reference to an application of the Town Council for sanction to borrow the sum of £1,600 for the erection of a refuse destructor at their sewage farm at Newbold. It was stated that the contractors for the removal of refuse had to find places for its disposal as best they could, and it was now necessary for some alteration of the present system. The quantity of refuse to be disposed of was about 10,000 tons a year, and it had been decided that a Horsfall destructor would be most suitable for their purpose.

**Halifax Tramways Extensions.**—A special meeting of the Halifax Town Council was held last Wednesday evening to consider a report of the Tramways Committee recommending that Parliamentary powers be obtained to enable the carrying out of important tramways extensions at a cost of about £160,000. Nine new routes were suggested, and after some discussion it was agreed to include them in the Parliamentary Bill. It was further resolved to add a line from Salterhebble up Jubilee Road to Siddal; a line up New Bank to Southowram; a line from Illingworth to Causeway Foot; and a line up Parkinson Lane. The Council also decided to seek power to double the present line in King Cross Lane, from the top of West Parade to Parkinson Lane, which they had previously been prevented from accomplishing owing to the opposition of private owners.

**Westminster Improvement Scheme.**—A meeting of the Vestry of St. Margaret and St. John, Westminster, was held last Wednesday evening at the Westminster Town Hall, under the presidency of Mr. J. G. Chapple. There was a long discussion upon an adjourned motion by Mr. E. W. Granville-Smith, L.C.C., approving the general outlines of the Westminster improvement scheme, and pledging

the Vestry to recommend to the Council of the new Borough of Westminster, as constituted by the London Government Bill, the contribution of a sum not exceeding £100,000. In the course of the discussion an amendment was moved by Mr. Hayter, L.C.C., and accepted by the mover and seconder of the original resolution. The motion as amended was agreed to on a division by thirty-three votes to nineteen. It assented to the contribution of £100,000, subject to the understanding (1) that the charge falls upon the area of Westminster as reconstituted by the London Government Bill of this Session, and that provision be made in the County Council's Bill to this effect; and (2) that the space on the east of Millbank Street from Victoria Tower Garden to Lambeth Bridge be converted into a public garden.

**Proposed Extensive Improvements at Preston.**—Some time ago the Preston Corporation applied to the Local Government Board for permission to borrow £42,000 for street improvements and sewerage, £2,645 for fire brigade purposes, and £1,500 for slaughterhouse extensions. Mr. W. A. Ducat recently held an inquiry into the application. Mr. H. Hamer, the Town Clerk, and Mr. Cookson, the borough surveyor, presented the plans, and Mr. Hamer stated that the roads which it was very necessary to modernise were Fylde Road, Watery Lane, North Road from Ormskirck Road to Garstang Road, Bow Lane and Spring Street, Lancaster Road, Moor Lane, Ribbleson Lane from Deepdale Road to Acrogate Lane, Newhall Lane from Stanley Street to Acrogate Lane, and Park Road. With regard to the fire brigade proposals, he stated that it was absolutely necessary that there should be practically a rebuilding. The Town Clerk dealt next with the slaughter-house proposals, and stated that the provision at the present abattoir was for sixty cattle and 300 sheep. Then there were the Co-operative Stores and the slaughter-houses in the town, which gave accommodation for seventy cattle and 300 sheep, making the total accommodation 130 cattle and 600 sheep. It was considered now that the requirements of the town necessitated provision for 160 cattle and 800 sheep. No opposition was offered to any of the proposals.

## Property and Land Sales.

To Land and Building Societies, Builders, Speculators, and Others.

**NEW SOUTHGATE**, about three-quarters of a mile from New Southgate Station (Great Northern Railway), and seven miles from London.—A very eligible Freehold Building Estate of about 47 acres, 2 roods, 30 poles (land tax redeemed), adapted for the erection of moderate-class houses, with roads and sewers recently constructed through the chief portion of the land, and the plans for the remainder passed by the District Council. For sale under a special Act of Parliament, and ripe for immediate development. Messrs.

**DEBENHAM, TEWSON, FARMER**, and **BRIDGEWATER** will **SELL**, at the Mart, on **TUESDAY, JULY 25th**, at **TWO**, in One Lot, with possession, this valuable **FREEHOLD BUILDING ESTATE**. The property is ornamentally timbered, commands pleasant views, and has an undulated surface; it is believed to contain brick earth and, in parts, gravel. A new 50ft. road has been made from the principal entrance to the estate from Oakleigh-road; also two other new roads leading from East Barnet-lane, an old-established parish road to which the property has extensive frontages. It abuts on the west upon the Great Northern Railway, and it is probable that arrangements may be made with the Company for a station on the estate. There is every facility for drainage and gas and water supplies. On the estate is a red brick and tiled residence of good elevation, known as The Retreat, with premises adjoining; also a stone and slated building formerly used as a chapel. There are capital services of trains from New Southgate Station to King's Cross, Moorgate-street, and Broad-street, and Oakleigh Park Station is also within a convenient distance of the northern portion of the estate.

Particulars and plans of Messrs. C. and S. HARRISON and Co., Solicitors, 19, Bedford-row, W.C.; and of the AUCTIONEERS, 80, Cheapside.

SALE DAYS for the Year 1899.

Messrs.

**FAREBROTHER, ELLIS, EGERTON**, **BREACH, GALSORTHY**, and **CO.** beg to announce that the undermentioned dates have been fixed for their AUCTIONS of FREEHOLD, Copyhold, and Leasehold ESTATES, Reversions, Shares, Life Interests, &c., at the AUCTION MART, Tokenhouse-yard, E.C.

Other appointments for intermediate Sales will also be arranged.

Thursday, July 20	Thursday, Oct. 26
Thursday, July 27	Thursday, Nov. 16
Thursday, Aug. 3	Thursday, Nov. 23
Thursday, Aug. 10	Thursday, Dec. 7
Thursday, Sept. 21	Thursday, Dec. 14
Thursday, Oct. 12	

Messrs. **FAREBROTHER, ELLIS, and CO.** publish in the advertisement columns of "The Times," "Standard," and "Morning Post," every Saturday a list of their forthcoming Sales by Auction. They also issue on the first of every month a schedule of properties to be let or sold, comprising landed and residential estates, farms, freehold and leasehold houses, City offices and warehouses, ground-rents, and investments generally, which will be forwarded free of charge on application.—No. 29, Fleet-street, Temple Bar, and 18, Old Broad-street, E.C.

By order of the Executors of the late owner.

The Valuable **FREEHOLD PROPERTY** known as "Royal Dockyard Wharf," Lower Woolwich-road, S.E., together with the Fixed Plant and Machinery and Goodwill of the old-established **TIMBER and BUILDERS' MERCHANT'S BUSINESS**, as a going concern, and the **LEASE** of the adjacent **Waterside PREMISES**, known as "Mast Pond Wharf," will be offered for **SALE** by Public AUCTION in One Lot by

**MESSRS. BRADSHAW, BROWN, and CO.** at the MART, Tokenhouse-yard, E.C., on **TUESDAY, JULY 25th**, 1899, at One o'clock precisely.

The Freehold Property (built by the British Government) has a granite embankment to the River Thames of about 400ft.; and a frontage of about 442ft. to Lower Woolwich-road, with three cartway entrances therefrom, and comprises an area of about 2½ acres. Two granite-paved slipways, one 235ft. long, 53ft. wide.

"Mast Pond Wharf" has a frontage to the river of about 100ft., and contains an area of about three-quarters of an acre.

The Lease has an unexpired term of about seven years, at a rental of £150 per annum.

**JOHN BARLETT, Esq.**, Solicitor, 26, Bush-lane, E.C.; Auctioneers' Offices, Billiter-square Buildings, E.C.; and Millwall, E.

**SPRING-GROVE ESTATE, ISLEWORTH, MIDDLESEX** (overlooking Osterley Park, the seat of Earl Jersey).—126 acres of **FREEHOLD BUILDING LAND**.

**MESSRS. GREEN & SON** beg to announce that, the above PROPERTY not having been sold at the recent Auction, they are prepared to enter into negotiations for same as a whole, free of restrictions, or sub-divided as follows: 53 acres adjoining Osterley Park Station; 48 acres adjoining Osterley Park Station; 6½ acres with building frontages of 2860ft.; 7½ acres with building frontages of 2917ft.; 9½ acres with building frontages of 1317ft. Portions of the property would be let at ground rents to be arranged.

Particulars, plans, &c., of Messrs. **GREEN and SON**, Auctioneers and Surveyors, 28 and 29, St. Swithin's-lane, London, E.C.

**Preliminary Notice.**—Higham's Park, Walthamstow.—The very valuable Freehold Building Estate of nearly 40 acres, known as Higham's Farm, beautifully situated, contiguous to the well-known Higham's Park woods and lake (one of the prettiest portions of Epping Forest), adjoining Woodford Golf Links, and seven minutes from the railway station, the whole being admirably adapted for development as a residential building estate.

**MESSRS. KEMSLEY** will **SELL** the above by AUCTION, in one lot, at the MART, on **FRIDAY, July 21**, at two.

Particulars, in due course, of **R. Oliver, Esq.**, Solicitor, 1, Corbet-court, E.C., and of the Auctioneers, 41, Bishopsgate-street Within, E.C., and at Woodford-green and Romford.

**ANSELL and MALLOWS**, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

**R.I.B.A. EXAMS. PREPARATION**, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. **HOWGATE and BOND, Associates R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

**ARCHITECTURAL Institute, Society of Architects, and Civil Service Technical Examinations.** Preparation by correspondence, personally, or in residence. Seventeen first places.—**MIDDLETON and CARDEN**, 19, Craven-st., W.C.

## APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**WANTED** by a leading firm of builders in the West of England, **FIRST CLASS GENERAL FOREMAN**; One accustomed to Terra-Cotta preferred.—Write, stating salary required, to "Builders," care of Messrs. Deacons, 154, Leadenhall-street, E.C.

**ARCHITECTURAL ASSISTANT** (age 24-30), for Municipal Engineer's Office; temporary, probable duration 18 months. Salary 55s. per week.—Applications stating age, and enclosing three copy test, to be sent to Box 1135, BUILDERS' JOURNAL Office, 1

## APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

**YOUNG ARCHITECT, A.R.I.B.A.**, ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. **G. SCOREE**, 23, Newman-street, W.

**QUANTITIES** prepared, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL, 24

**PLUMBER, GAS, HOT-WATER FITTER** wants SITUATION; good references; seven years in city firm.—"E. M.," 55, Rehere-street, Goswell-road, E.C.

**GENERAL FOREMAN** wants a Job, Carpenter and Joiner. General knowledge of all branches, well up in structural alteration, public-house work; town or country. Good references.—"J. B.," 66, Acre-road, Kingston-on-Thames.

**ABLE ASSISTANCE.** WORKING and DETAIL DRAWINGS. DESIGNS, PERSPECTIVES, TRACINGS. QUANTITIES and SPECIFICATIONS. DIFFICULTIES of PRACTICE advised upon. **F. BRENT**, 34, Great James-street, W.C. 51

**ARCHITECT**, having spare time, is willing to undertake preparation of Working Drawings, Tracings or Perspectives. Terms moderate.—**Roberts**, 19, Lynton-road, Kilburn.

**DRAUGHTSMAN** seeks ENGAGEMENT. Seven years' London and provincial experience. Well up in horticultural work and hot water engineering.—Address **R. H. C.**, 5, Elm Bank Gardens, Barnes, S.W.

**WORKING FOREMAN of PAINTERS, GLAZIERS, and PAPERHANGERS** seeks RE-ENGAGEMENT in or near London. Good colourist. First-class references. Disengaged Saturday.—**J. A. 79**, Regent's Park-road, London, N.W.

**JUNIOR ASSISTANT (21)** seeks ENGAGEMENT. Four years' experience; neat draughtsman, quick tracer, colourist; used to plotting, inking-in, and general office work.—**COLLINS**, Hellingdale House, Exeter.

# TO MASTER BUILDERS, CONTRACTORS, AND ALL ENGAGED IN STONE-CUTTING.

**J. G. FAULDS'**

IMPROVED

## Multiplex Stone-Cutter.

*Any person manufacturing these Tools will be liable to prosecution for infringement of Patent.*

THESE IMPROVED TOOLS for stone-dressing combine lightness with great efficiency in working, with perfect freedom from the annoyance of bad sharpening, tempering, or other defects. They possess *double* the advantages of the AMERICAN TOOTHED TOOL, by having, in a handy and convenient form, double teeth, or a chisel and "tooling drove" combined, the efficiency and economy of which a PRACTICAL MAN WILL SETTLE IN A FEW MINUTES.

The outstanding merits of the MULTIPLEX STONE-CUTTER are its simplicity and economy. They are simple in construction. The Handles are made with a slot (see below) in which the Cutter is inserted, and the Tool is complete. There are no screws or joints in the Handle to give trouble in fixing or removing the Cutter. They are economical. By the use of these Tools a great saving is effected, all the loss of time, trouble, and expense incurred in getting the ordinary tools sharpened being avoided.

Owing to the handiness and durability of these Tools they are in constant use throughout the whole of the United Kingdom.

Two sample Tools, with six Cutters, sent carriage free to any address in the Kingdom on receipt of a Postal Order for 2s. to the

SOLE INVENTORS, PATENTEES, AND MANUFACTURERS—

## An Architectural Causerie.

**Architecture in the Novel:** In the second article of this series it was pointed out that one of the characteristics of the art of Thomas Hardy is the inimitable and almost uncanny way in which he makes us feel the presence of the past—how in a novel concerned with the emotions and thoughts of to-day, there hover around and about the scenes of the story, the atmosphere of an earlier age. Mediæval architecture and mediæval times are suggested by the backgrounds rather than by any description of place or building. In "Jude the Obscure" there is not only this suggestive and thoughtful method of treatment, but scenes are pictured in which actual and ancient structures of the Middle Ages are so interwoven with the thread of the tale that an appreciation becomes difficult without a keen interest in the social life of the past few centuries. Although these old times are so cunningly pictured, Thomas Hardy is too great an artist to ignore the effects brought about by time and the "restorer." Here is a passage descriptive of a Wessex village, which is probably not altogether an impersonal one, for behind the word picture there seems to lurk the likes and dislikes of the author. To paraphrase the words of Zola, it is the outward expression of the villagers' life seen through the medium of a temperament: "The village was as old-fashioned as it was small, and it rested in the lap of an undulating upland adjoining the North Wessex downs. Many of the thatched and dormered dwelling houses had been pulled down of late years, and many trees felled on the green. Above all, the original church, hump-backed, wood-turreted, and quaintly hipped, had been taken down, and either cracked up into heaps of road metal in the lane, or utilised as pig-stye walls, garden seats, guard stones to fences, and rockeries in the flower beds of the neighbourhood. In place of it a tall new building of German Gothic design, unfamiliar to English eyes, had been erected on a new piece of ground by a certain obliterator of historic records who had run down from London and back in a day. The site whereon so long had stood the ancient temple to the Christian divinities was not even recorded on the green and level grass plot that had immemorably been the churchyard, the obliterated graves being commemorated by ninepenny cast-iron crosses, warranted to last five years." Just as in "The girl from the Farm," referred to in a former article, the young girl glorifies in her imagination the town of Allington, from whence the stranger had come with tidings of its wonders, so the boy Jude, from the top rung of the ladder, sees the city to which in later years he is to wend his way. Like the prophet Ezekiel of Holy Scriptures, brought into the land of Israel and set upon a high place, he has a vision in answer to his prayer. From that time onward, as he goes about his daily work, he is always beholding "the city of light." It becomes deeply imprinted upon his mind, and acquires "a tangibility, a permanence, a hold upon his life," that never leaves him through all the troubles and sufferings which he passes in his unsuccessful endeavours

to reach the ideals of his youth. It was towards evening "when he repassed the barn to go back to Marygreen." Ascending the ladder, "he seated himself and waited. In the course of ten or fifteen minutes the thinning mist dissolved altogether from the eastern horizon as it had already done elsewhere, and about a quarter of an hour before the time of sunset the westward clouds parted, the sun's position being partially uncovered, and the beams streaming out in visible lines between two bars of slatey cloud. The boy immediately looked back in the old direction. Some way within the limits of the stretch of landscape points of light like the topaz gleamed. The air increased in transparency with the lapse of minutes, till the topaz points showed themselves to be the vanes, windows, wet roof slates, and other shining

beheld, the size and cubits thereof. John, on the other hand, is overcome by the richness of the materials. Both, like Jude, see the cities of their dream from a high place, and like the boy frame in their mind's eye their idea of a beautiful city. Some years after this event Jude enters the city of Christminster carrying in addition to his material possessions some considerable knowledge of the worthies—who had lived their youths behind its walls—and of his craft, which was that of a stonemason; resting at the brow of a little hill, he saw the city for the first time, with its "grey stone walls and dun roofs," the city of his vision which he thought would assist him to the fulfilment of his hopes. He realised later that such help would not come to such as he in his lifetime. "I love the place," he says,

LA FONTAINE SAINT MICHAEL AT PARIS. (See p. 367).

spots upon the spires, domes, freestone work, and varied outlines that were faintly revealed. It was Christminster unquestionably, either directly seen or mirrored in the peculiar atmosphere. Jude gazed on and on till the windows and vanes lost their shine, going out almost suddenly like extinguished candles. The vague city became veiled in mist. Turning to the west he saw the sun had disappeared. The foreground had grown funereally dark, and near objects put on the hues and shapes of chimeras." It is impossible to avoid comparing this vision of Christminster, which Jude likened to the Heavenly Jerusalem, with those seen by the prophet Ezekiel and the apostle John. Ezekiel seems to have been impressed principally with the measurements of the buildings he

after he had learned how little Christminster cared for him, "although I know how it hates all men like me—the so-called self-taught—how it scorns our laboured acquisitions, when it should be the first to respect them—how it sneers at our false quantities and mispronunciations; nevertheless it is the centre of the universe to me; nothing can alter that." In time Jude, with his love for the ancient stones of Christminster, came to read its history: "The numberless architectural pages around he read, naturally less as by an artist critic of their forms than as an artisan and comrade of the dead handicraftsman. He examined the mouldings, stroked them as one who knew their beginning, said they were difficult or easy in the working, had taken little or much time, were trying to

the arm or convenient to the tool. Cruelties, insults, had he perceived been inflicted on the aged erections. They were wounded, broken, sloughing off their outer shape in the deadly struggle against years, weather, and man."

G. LL. M.

### London's Great Railway Stations.

THE announcement that the terminus stations at Waterloo and Victoria are to be greatly enlarged has surprised no one, but it has drawn attention once more to the overcrowding of London. When the great railways were started, it was considered imperative that the termini should be in the suburbs, a policy of which London Bridge, Waterloo, and the old Bishopsgate station of the "Eastern Counties" were the most conspicuous examples; it was a mistake for which both the companies concerned and the public have since paid pretty heavily. The growth of Waterloo station coincides with the enormous expansion of the south-western suburbs; the greater part, indeed, of the new traffic of the last few years is suburban. Architecturally the terminus question is of importance because it involves the opening of new streets or the widening of old ones as approaches, and the building of a vast hotel which generally screens the station and makes or mars the neighbourhood. The extension of Waterloo, though at present considered as purely utilitarian, will some day assume importance of another kind; this will be when the Surrey side of the Thames is embanked, a work sure to be followed by the opening up of new approaches to the river. Victoria station is—if the Brighton Railway Company has its way—to be extended right up to Eccleston Bridge, and there is some question of a possible absorption of the Grosvenor Hotel. Of all the London termini, this is in one sense the most important, for it stands at the threshold of one of the few districts in the capital which have been systematically laid out and designed in a single style of architecture, with great Mansard roofs rising nobly against the sky; a mistake here would spoil a very fine quarter. Perhaps no building has been more criticised than the great station at St. Pancras. A large part of "Somers Town" was swept away to make room for it, so completely that the name is now seldom heard. The hotel was originally designed by Sir George Gilbert Scott for the Foreign Office; rejected by Lord Palmerston, it was eventually carried out in a totally different quarter and for a totally different purpose. The public blames its architect, yet here is a Gothic palace intended to overlook the woods and waters of St. James's Park, taken as it were bodily to the Euston Road. The long lines of pointed windows are not without beauty, but the building seems too high and bulky and dwarfs the whole quarter. This, however, is no wonder, for, to suit the high level of the Midland Railway, the vast structure had to be raised on a lofty terrace, isolating it from its surroundings with which it will never harmonise. Perhaps the busiest terminus in London is that of Liverpool Street. Here again, the architectural effect has been marred by an administrative mistake, for the station buildings are in light brickwork with white stone dressings, and the style is Gothic, whilst the hotel is in red brick and exhibits a species of free Renaissance. Both are good in their way, but the effect of their juxtaposition is extremely harsh.

J. C. P.

## On Reflection.

### An Art Gallery for Newcastle.

LAST Thursday the portrait of Alderman W. H. Stephenson, which has been subscribed for by the public in appreciation of the alderman's manifold services to the community, was publicly unveiled on the walls of the council chamber in the Town Hall, Newcastle-on-Tyne. The commission to paint the portrait was placed in the hands of Mr. Ralph Hedley, and he has well fulfilled his task. Earl Grey made the presentation. Alderman Stephenson has been intimately connected with the history of the city for the past thirty years, and has thrice been made mayor. He recently made the valuable suggestion that an art gallery, open to the general public, should be established in the city in commemoration of the fifth centenary of the Shrievalty of Newcastle. Pending the establishment of a permanent home he has helped to get the large portion of the Victoria Lending Library reserved for works of art, and it is here that his portrait will be placed when other works of art have been obtained to accompany it; until such time the portrait is housed in the Council Chamber. Mr. James Hall, writing to the "Newcastle Daily Chronicle," suggests that it would be more appropriate to establish an industrial museum, such as the mechanical museum at South Kensington, in which might be treasured the great inventions of the men of the district. This suggestion might well be carried out by having a combined art gallery and industrial museum, and would, doubtless, be supported by the wealthy manufacturers of the district. The only picture gallery of any importance within a reasonable distance of the city is that at Barnard Castle, where the superb collection of works of art left by the late Mrs. Bowes (Countess Montalbo) is housed. This gallery can, however, only be enjoyed by a small percentage of people, owing to its out-of-the-way position. The establishment of an art gallery is, therefore, very necessary for Newcastle, and it seems highly probable that something definite will now be done to meet the want. The importance of the city warrants a building of considerable architectural pretensions.

AN important judgment was lately given in the Leicester County Court by His Honour Judge Wightman-Wood which has construed and defined the precise

limit and conditions to be understood by the term "a building 30ft. in height," a term which has long been a much-vexed question in the administration of the Workmen's Compensation Act. As is well known, a "building 30ft. in height" is included along with factories and other places as one of the conditions under which the benefits of the Act may be obtained. A workman, for instance, who falls or otherwise injures himself on a building 30ft. or more high, in the course of his duties, can claim compensation under the Act, but he cannot make such a claim if the building in question should measure but 29ft.  $\frac{7}{8}$ in. in height. Such incongruities must, of course, appear in all Acts or regulations wherein a specified limit has to be stated, and the difficulties which have arisen on this matter and the number of cases involving this point which have come before the courts, have not turned upon any matter of actual inches in the measurement of the building, but upon the meaning of the term "a building 30ft. in height." The question whether men who fell less than 30ft. from a building 30ft. high, who injured themselves in working on the lower portion of a building, part of which was 30ft. high, and many others have successfully arisen, but have produced no clear statement as to the construction to be put on the terms to which we are referring. The case tried before the Leicester County Court judge was the claim of a labourer who had fallen less than 30ft. into the area of a building, which was, in another part, over 30ft. high, *measured from the area*, but less than the prescribed height measured from the ground or street pavement level. In giving his decision, the judge construed this ambiguity of the Act as follows: That the height of a building should for the purposes of the Act be measured from the point when the walls can first be seen above ground in a general view. The height of a building, therefore, having open areas may be computed from the pavement line of those areas. Any other construction of the Act the judge pointed out would lead to such an anomalous absurdity as that it should be necessary to say that a man fell 33ft. from a building 27ft. high. The judge also decided that the whole of a building, any part of which was 30ft. high, might be considered to be such a building as entitled a workman injured thereon to the benefits offered by the Workmen's Compensation Act. It must be considered that this construction of the Act is reasonable and fair, and it is well that some distinct understanding is at last come to as to the meaning which may be applied to this much debated phase of the Act.

## OUR COMPETITION.

### PREMIUMS AND DRAWINGS.

CHEQUES HAVE BEEN DESPATCHED TO-DAY to the winners of the three premiums in our recent Competition for designs for a Country House. The amounts of the Cheques and the names of the winners are:

20 GUINEAS.—HERBERT L. NORTH, B.A.

10 GUINEAS.—HARRY PERCY SHARPE.

4 GUINEAS.—WILLIAM MITCHELL.

This, as we said before, will conclude our responsibility in the matter. We hope soon to be able to announce the decision of the client for whom the Competition was instituted with regard to which of the designs he intends to have carried out.

We have received several requests for permission to see the designs from clients wishing to build houses of a similar character to that competed for, and probably other competitors will be commissioned to carry out their designs. We have, therefore, not yet returned the designs, but if any competitors would prefer to have their drawings back without delay, we will do so on receipt of application for them.

SCULPTURE PANEL SHOWING TREATMENT OF TYMPANUM.

## SCULPTURE IN RELATION TO ARCHITECTURE.\*

By T. DUNCAN RHIND.

IN speaking of sculpture, it is my intention to take figure work more than ornament, although the latter is only too often not carefully enough thought out.

Sculpture and architecture are always associated as the two arts which should go hand-in-hand; in the early and middle ages this was the case, as we can see from the buildings of those times. In the present era of commercial enterprise, they certainly do not go hand-in-hand. Looking at all the many big competitions that have taken place in the last few years, we study the premiated designs in one or other of our periodicals and find in nearly all the designs, grand groups of sculpture, showing fine figure friezes and other adornments associated with this art; but look a little closer, and what do we find? A small—very small—side note, saying that the sculpture and carving are not included in the probable estimate. And so it holds throughout, at least in this country, when an important commission is placed in one of our foremost architect's hands, there is always without exception a cutting down of the original estimates and Sculpture is the first thing that is knocked off. One can imagine the effect on the minds of a present day committee when their architect instead of submitting to them an estimate made up of prices of so much per cap and rate per foot of egg and dart + 150 swags at so many shillings a piece, asks them to give him permission to place a commission for say four groups of sculpture at £1,000 or £2,000 a-piece. They would begin to think the worry of the big commission had begun to tell on his brain. But this feeling is due a good deal to the sculptors themselves. In our art circles and in the public mind too, the notion is that the highest branch of the sculptors' art consists in the occasional execution of a portrait bust, varied now and again by an ideal figure 2ft. or 3ft. in height, and that anything outside of such routine is beneath the dignity of the great sculptor, and belongs more to the

domain of the monumental mason or the decorative stone carver.

I take this again to be very largely due to the class of work which for the last twenty or thirty years has formed the leading feature in the sculptural exhibits of Scottish Academy Annual Exhibition, where on the shelf allotted to this depressing show, bust after bust, and small ideal figure after small ideal figure, have succeeded and vied with each other in monotonous and wearying iteration. When we go to a great art centre like Paris, and visit the Salon or other art collections there, how obviously and forcibly the truth is brought home to us that the grand field of the sculptor lies, not in the productions of what Mr. Ruskin very aptly terms "furniture sculpture," but in the designing and execution of sculpture to adorn public buildings, monuments to immortalise great men and commemorate brave deeds or great events in national history.

That our painters and sculptors know little, and care less, about architecture is an undisputed and melancholy fact; but to those of them who have studied their art, it should be abundantly patent that in their arts when used in relation to architecture—that is, in executing sculptured decorations and mural paintings—lies the best sphere of the sculptors' and painters' usefulness, so far as the education of the masses is concerned. And they should remember that it is in connection with works of this character, works that did not appeal to cliques or classes, but to humanity at large, that all the great artists, men such as Michael Angelo, are known to us of this generation. Of course, the sculptors here may not be altogether to blame for their lack of appreciation of what I consider is their true art through the fact that in the ranks of our academicians, sculptors are, like architects, in a very small minority. The Scotch Academy's fatherly regard is lavished largely and munificently upon painting, and no space seems wide enough to allow of the paternal embrace. Towards sculpture and architecture it turns a cold, unsympathetic eye, and treats them as insignificant brats of the muses family, and keeps the one for filling up odd corners or making a centre to a group of palms, and the other is granted the high honour of the condemned cell, which is generally more appreciated as being a corner where at last the poor victim gets a rest from the glaring heterogeneous mass of colour as shown by some of our up-to-date impressionists.

To look at the earlier examples there is of course the one example that stands *par excellence* above all others, the Parthenon Frieze. There is no other piece of sculpture that there are more replicas of in our schools of art, the young sculptor is taught to look up to and revere it, and it is, one should always remember, sculpture that has been executed in relation to architecture; and not only that, but from authorities on the subject I understand that it was executed in position. But this was the case with most of the Greek sculpture. There is not, I think, one piece of antique sculpture that has been handed down to us that was not carefully studied as to its architectural surroundings, and the greater number were used in connection with one or other of the temples.

There can be no doubt whatever that they saw the desirability and necessity of surrounding themselves by work pregnant with thought and great in beauty, which would attract and please the eye and elevate and instruct the mind.

In their sculpture as in their architecture the Greeks had a very characteristic form. One of their greatest beauties is the way in which they manipulated folds of drapery generally clinging rather closely to the figure; it was modelled in a series of repeating lines, forming and carrying out the lines of the composition. This is very strongly shown in some of their bas-reliefs. In their ornament, the same thing applied. Their use of the flower, egg and dart, or acanthus leaf is always marked by what we might call the *liney* effect. Then the Greek also used that fine combination of figure and ornamental sculpture, the caryatide, as seen at the Temple of Erechtheum. It is in the South of Europe that sculpture seems to have had its home. In the earlier centuries, when we come from Greece eastwards, we strike Italy, the very name of whose capital—Rome—seems to spell sculpture whenever it is mentioned. The sculpture in the early ages here designed and executed by the Romans differed from the Greeks in the same respects as their architecture. It was not so refined, and much bolder. Their figure work poses were often very intricate and more voluptuous in comparison with the always simple pose of the Greek figure. Their drapery effects had the same characteristic crossing folds, and generally did not following the lines of the composition. As in figure, so it was with their ornament;

\* A paper read before the Edinburgh Architectural Society.

the acanthus was broader, not so liney and spiky; egg and dart rounder, and so on throughout.

As regards the later mediæval work, it is in the south of Europe generally and in Italy more particularly that the best examples will be found. There we have sculpture in all its different phases, the ideal figure or group, used in connection with architecture, and such grand and impressive work as the Ghiberti gates and the work of Michael Angelo and the later Renaissance. In Michael Angelo we have a man whose every name acts as a crushing blow against any argument that architectural sculpture is not the highest branch of that art. We all know the glorious memorials he has left behind, such as the façade of the Spado Palace at Rome, where the delicate and refined treatment of the sculptural decorations seems so much a part of the whole design, that one cannot help seeing how much sculpture may do for a building when properly used.

Another great master of this time was Della Robbia; his Madonna subjects and pediments have held their own long after their originator left the scenes of his labours. How miserably poor and insignificant is some of our present work of the same character and material when compared with it.

Coming further north, we find in France that the mediæval sculpture is lavished on the ecclesiastical buildings. How beautiful are some of the mediæval French doorways in their sculpture. At Chartres and Reims Cathedrals the classic influence is shown especially on the figure work. At Rheims the drapery has been treated in the exact manner of the ancient Greeks—a mass of what one might term lines running to a point. In later times we get more evidence of how the French have considered sculpture as almost indispensable in working out a design, as seen in the work at the Louvre. In one pavilion there is not one piece of the sculptural decoration that one can call a stock design from the fine frieze work up to the crowning group on the top pediment; the whole is studied in proportion to the surrounding architecture, and although there is a fair amount of sculpture on the front, yet it does not seem in any way overloaded. Therein, I think, lies the great secret of sculptural decoration.

Before departing from this period of work I should like to call attention to one of the finest examples of a fountain, of which there are so many in Paris, where architecture and sculpture have been blended together and produced a grand result—that is, the Fountain of St. Michael.

Germany is not so good as France. The sculptural decoration there is always to my mind carelessly designed as regards proportion in relation to the surrounding details, though some of the heraldic and ribbon work, as seen at Nuremburg, is exceptionally fine.

In our own country we have not many examples of the older work, most of them having been destroyed by the religious fanatics of our middle ages, though when we come a little later we have some very fine examples, such as Wren's London Churches. He, unappreciated as he was at the time, knew the value of sculpture in knowing where *not* to put it; and some of the ornamental and figure work of this period was well studied and artistic. When we come to Adam's work in a later age we find a distinct Greek tendency, the ornament having much less projection and more refinement. In Edinburgh there are many interesting examples of it. I am sure few can enter St. Andrew Square without unconsciously letting their eyes rest on that stately building, the British Linen Company Bank, one of the few public buildings in Edinburgh that you feel to be completed. Not overloaded by any means with sculpture, it appeals in its entirety to the intelligent eye as a work designed by an artist who thoroughly understood the position which sculpture should occupy in relation to architecture. I may also just mention as other satisfactory examples the Commercial Bank in George Street, with its imposing and completed pediment; and lastly, but not least by any means, the College of Physicians, in Queen Street, with its chaste and refined

façade. This always impresses me as a beautiful example of the result obtained when architecture and sculpture are harmoniously wedded together. Of course, it goes without saying that sculpture outside a building should tell in symbolical, yet easily understood language the uses contemplated for the building. But we have one or two examples which do not convey to anyone the idea of what they represent. One example in particular is the Scotch Academy Galleries. Think how different the case would be if each pediment were filled with sculpture, a frieze behind the columns or groups on pedestals at the corners of the building, giving an unmistakable indication of the purposes and the uses for which the building was erected. I have reason to believe that such sculptural treatment formed part of the architect's original idea. The very fact that this building—one which surely of all others should have been completed with all the appropriate sculptural accessories—has been left so conspicuously plain shows the spirit of indifference towards sculpture that was abroad at the time when it was being built, an indifference which unfortunately has been perpetuated to the present day. Had this building been erected in France for a similar purpose our Continental neighbours would have employed the best sculptors to breathe the breath of life into its great voiceless, silent body; in one pediment most likely introducing a group of figures representing Painting, another representing Sculpture, and a third Architecture, while Literature and Music would be illustrated as indicating the source whence so many artists draw the inspiration that gives birth to and animates the work of their hands. Such work as I have just described is what all true sculptors would consider the best of work—work on which a French sculptor of the highest excellence would put forth his greatest effort to produce something worthy of the subject and creditable to his name.

If it should seem to some that I am, on the subject of sculpture, unduly extolling our friends across the Channel, let me remind them that art has made itself a tremendous power in that nation; a National Association of artists, architects, sculptors, and painters arrange artistic matters. Just imagine the National Opera House and the Hotel de Ville providing work for some two hundred of the best sculptors, and you will understand the magnificent groups with which these buildings are adorned, an experience I hardly expect we, in this country, will ever gain. Of course, I know the architecture is perhaps not what everyone likes, but it is always good academic stuff and not the production of a man who is ignorant of half the essential points of design, backed up by officials who have no ideas on art, except economy. An example of this was not long ago brought to light in connection with the Museum of Science and Art in Chambers Street, where, when it was proposed to go on with the sculpture for the building, the Government officials in London tried to regain possession of the money which had been put aside for the purpose by the original votes for the building, doubtless striving to appear before the chiefs of their departments as careful economists in saving a sum which had already been voted by Government. Fortunately, the strong protests that were made prevailed, and the edifice was reluctantly allowed to be completed by the execution of the allegorical sculpture according to the original design. Authorities seem to ignore the fact that we can be taught by the sense of sight as well as by the sense of hearing, the one sense being kept in co-operation with the other. A leading sculptor, speaking on this subject at the Art Congress held in Edinburgh in 1889, said:—"It can by no means be maintained that the present condition of things is the fault of architects. On the contrary, all those who have relation with them have their sympathies constantly appealed to when they see the architect's designs destroyed, his ideas defaced, his intentions of beauty made mean and voiceless, by the unintelligent decrees of local committees and governments, whose barren utilitarianism and vicious economy are utterly opposed to the purposes of art."

Well, we have had a good deal of what should not be done. Let us look at what examples we have of the present time, and I think it will be agreed that a modern combination of architecture and sculpture is found Dr. Anderson's National Portrait Gallery in Queen Street, Edinburgh. Here we have not only a fitting home for the examples of Scottish art, but it tells its story to visitors. They see all the famous Scotchmen of bygone years placed in the outside niches and they will be handed down to future generations by these memorials when other artistic works of a different kind may be lost or destroyed. At the principal doorway are the allegorical panels of the Arts, the Scots' Arms, and, crowning all, the figure of Scotland, shielding and encouraging art. Let us hope that this building will do something towards educating those in authority who have the ordering of our public edifices in the direction of their ceasing to deny to architecture the company of her sister art.

In London there has been erected quite recently one of the best examples of architecture and sculpture, both excellently designed and executed, and the whole combined producing a dignified and harmonious design, the only fault being that the site is so placed that the public will pass quite near it without knowing that at their side is a lesson on art which would perhaps teach them to think with a recognised authority on art who says, "A great building decorated in a great manner is the supreme achievement of art. It is greater than any isolated picture or statue, and I am convinced that it is even also greater than any building, however great, which is not so decorated." I refer to the Institute of Chartered Accountants in Moorgate Place, London. The sculpture here was executed by two of our foremost sculptors, Hamo Thornycroft, R.A., and the late Harry Bates, A.R.A., as noted in the letterpress of the book published on this building; it says: "A dignified building of monumental character has been the chief aim, and, as in all classic buildings, a certain uniformity and regularity of parts is observed in the main features; but interest and vitality are secured by the change of detail and variation of the smaller parts." The upper storey is regularly divided by an order of a plain and substantial character, through the lower part of which passes a rich frieze, 140 feet in length. This frieze, the work of Mr. Hamo Thornycroft, R.A., representing those varied interests which look to the chartered accountants for financial guidance and order, is one of the chief features of the building, and forms an integral part of the design. It is a noble work, ably conceived and admirably carried out, and should go far towards encouraging a more extensive use of really good sculpture by sculptors of high standing. There are also the fine carved groups by Bates, and the figure of justice crowning the oriel by Thornycroft.

Another class of work on which I would like to say something is monumental sculpture, as exemplified by the public monuments in our streets and squares. During the first half of the present century the regulation monument consisted of the representative figure attired in classic costume, while in later years it was modelled in ordinary dress, nearly all the statues being erected on pedestals as plain and severe as it is possible to design. In the hands of an artist like Chantrey this was usually a success, as that very fine statue of Pitt, standing at the junction of Frederick Street with George Street shows. But, as a rule, I consider it forms as most uninteresting type of memorial. And this is more especially the case where, repeated so often as it is in Edinburgh, it becomes monotonous in the highest degree, and consequently attracts the attention of the inhabitants little more than the lamp posts they are constantly passing. When a memorial statue is erected in Edinburgh, all interest seems to vanish the moment it is placed in its allotted position. This is probably owing to the difficulty of making a portrait-statue, standing in an isolated position, of a decorative and interesting character. I presume that most people, who have given the subject any consideration, will be ready to admit that a

much greater variety of treatment in this matter is loudly called for, and that it would be far more artistic and effective were groups of sculpture erected to commemorate the deeds of the men we wish to immortalise. But, unfortunately, committees rise up and assert themselves, and lay down such laws to the sculptor as leave him little margin in which to give effect to his own ideas.

When it was first resolved to commemorate the worth and eminence of the late Dr. Wm. Chambers, as an individual, a public man and a citizen of Edinburgh, the first proposal was that this should be done by erecting a monument bearing his recumbent effigy in a memorial chapel at St. Giles' Cathedral. One would have thought that there could not have been a more beautifully appropriate method of commemorating the man to whom the restoration of the cathedral

the way, and his ignorance, backed up by doggedness, scored a most deplorable success. He scouted as preposterous the beautiful and becoming idea I have described, and triumphantly clenched and drove home his victory with the Doric exclamation, "What ever saw Dr. Chambers lyin' on his back?"

(To be concluded.)

**Workmen's Dwellings for Highgate.**—Tenders, amounting to £13,639, have been accepted for the erection of sixty artisans' dwellings at Highgate by the Hornsey District Council. The total cost of the scheme, including land and roads, will be £16,700.

**A New School for Boys at Worcester** has been erected at a cost of about £1,300. The main school-room is 45ft. by 22ft., and provides

## BENEDETTO PISTRUCCI.

### NOTES ON THE WORK OF AN ITALIAN ARTIST ONCE HONOURED IN ENGLAND.

By ALFREDO MELANI.

ENGLAND has often honoured loyally the genius of Italian art. For instance, there is Inigo Jones, admirer of Palladio and the diffuser in England of the Palladian theories; and then more recently Sir Christopher Wren has induced among English people a continual interest in Italian art. Perhaps it may be asked what Wren had to do with it, and I reply that Wren had a great deal to do with it, inasmuch as the architect of St. Paul's was very strongly impressed by Cavalier Bernienio

THE MADONNA AND CHILD: BY LUCA DELLA ROBBIA. NOW IN THE NATIONAL MUSEUM, FLORENCE.

is entirely due. By removing the obnoxious partition walls, and disinterring the original details from the uncouth and cumbrous dirt in which by ignorance and carelessness they had been buried, and thus presenting a resurrected cathedral wearing all its grand original lineaments, he did a work for his country and for the city which will ensure for him the remembrance and gratitude of many and many a generation to come. Now what could possibly have been a more fitting consummation to taking a friend (but a stranger to the city) on a tour of inspection through the "long-drawn aisle and fretted vault" than finally to turn to the memorial chapel, and, pointing to the monument, say: "There is the effigy of the large-minded, open-handed man who made it the crowning work of his long and well-spent life to sweep from the building around you the accumulations of centuries of Vandalism and ignorance, and gave it back to his country in all its pristine grandeur and purity of detail."

But the inevitable committeeman stopped

accommodation for ninety-six boys. There are two classrooms, 22ft. by 15ft., giving accommodation for thirty-two boys. Access to these class-rooms is obtained from the school-ground opposite the school-room. At the opposite end to the class-rooms there are a cap-room and a lavatory, approached from the entrance vestibule. Messrs. Henry Rowe and Sons, were the architects, and Messrs. J. Wood and Sons, of Worcester, were the builders.

**Mr. Thomas Bonnar** died last Wednesday at his house, 7, Ann Street, Edinburgh. He was the senior partner of the firm of Thomas Bonnar and Son, decorators and art designers, of 58, George Street, Edinburgh. He had a keen appreciation and knowledge of art in all its aspects. In addition to papers contributed to antiquarian, architectural and art societies, Mr. Bonnar wrote a biography of George Meikle Kemp, the designer of the Scott Monument, who was his uncle by marriage. Latterly he took an active part in obtaining the charter of the Imperial Institute of British Decorators. He was in his fifty-ninth year.

when he met him at Paris; and, again, Wren studied under Pietro Lescot and Filiberto de l'Orme. Having said this, it is quite unnecessary to speak of Dante Gabriel Rossetti, or of Ruskin's enthusiasm for Venice, or yet of the great interest of the English in the conservation of Italian artistic patrimony. My object here is to recall briefly an artist who it is possible might be forgotten in England, as he has almost been in Italy. I speak of Benedetto Pistrucci who gained a great reputation in the English metropolis, where he left diverse works of inexpressible taste and fineness.

Benedetto Pistrucci was born at Rome on May 24th, 1783. He was a pupil of the celebrated Academy of St. Luke, in which taught Raffaello Mengs, an enemy and an implacable critic of the Rococo style.

Even in his first steps upon the highway of art Pistrucci was a very able modeller, and at the age of seventeen he could engrave in hard stone as none other at that age. Whilst still very young he executed with such precision the great cameo representing the Apollo and

ARCO DE SANTA MARIA, BURGOS.

of Augustus, that it was believed by Baron Denon, of the Imperial Museum of Paris, to have been a work of great value.

It was Bonelli who wished to bring Pistrucci to England, but circumstances obliged the Roman artist to remain longer in Paris, where he had the modelling in wax of the retreat of the great Emperor.

Three months after the catastrophe of Waterloo, and the entry of the allies into Paris, Pistrucci resolved to go to London, where, by good fortune, he was commissioned to execute a portrait of Sir Joseph Banks. I say by good fortune, because, while in the house of Sir Joseph Banks, he met the celebrated antiquary, Payne Knight, who, in the presence of Pistrucci, judged a certain cameo belonging to Sir Joseph as being of Greek workmanship. "See here," remarked the antiquary, "this is how the Grecian artist worked; how beautiful, how delicately executed!" To such exclamations as these Pistrucci could not resist a smile. "But, my dear sir," said he, "you are mistaken; this cameo was executed by me, and if you just glance between the leaves which are interlaced in a crown upon the head of Flora, you will see the initials of my name." In spite of this, however, the antiquary would not be persuaded. "Very well, then," replied Pistrucci, "I will do another like it," which he did; and that cameo was acquired by Mr. Henry Hamilton, and Payne Knight was convinced. In his will Payne Knight left to the British Museum the whole of his priceless collection, among which is the celebrated cameo of Flora, which even now is so much admired as a piece of Greek workmanship.

In 1816 the Roman artist, at the request of the head of the Mint, cut in hard stone the originals of the dies for the coinage. After this he was nominated head engraver of the Mint, and executed the dies for the coinage of George III. and George IV.

Pistrucci succeeded admirably as a die engraver, yet it was only in 1816 that he set up as such.

In consequence of the great victory of 1815, George IV. ordered that a medal should be struck in commemoration of so memorable an event. Flaxman, who enjoyed a stupendous

renown, was chosen to design the medal. Pistrucci was given the work of engraving it. Either from pride or the laudable sentiment of dignity, the head engraver of the Mint refused the work of engraving the medal of Flaxman. It seemed to him that he should be not only the engraver but the designer of the medal; and he designed a model. This gave so much satisfaction that the Roman artist was charged with its execution, and was afterwards nominated chief engraver of the medals to His Britannic Majesty. However, some hitch occurred which spoiled the effect of the triumph, so that the work, though commenced, was soon abandoned by Pistrucci, who in 1839 left the English capital and returned to his own country. Whilst in Rome he was offered the post of chief engraver of the Roman Mint. Very shortly after this, however, he returned to London. But he no longer enjoyed that satisfaction which, in the past, rendered so genial his sojourn in that great and populous city.

Therefore he retired to Windsor, where, far from the roar of the metropolis, he took up once more his work upon the Waterloo medal. Circumstances, however, had changed, and the public regarded the battle of Waterloo under a different light. George IV. had intended to have the medal executed in gold and to offer a model to each of the Allied Sovereigns, and also to the great commanders, Wellington and Blücher. Others were to be struck in silver and others in bronze. An account of this celebrated work was given in the "Illustrated London News" of June 22nd, 1861.

Pistrucci worked at Windsor for about twelve years—years of close application, since the Roman artist was accustomed to work fourteen hours per day. He also practised statuary, executing several busts in marble, among which was one of the Count Pozzo di Borgo, Russian Ambassador in London, and also one of the Duke of Wellington.

Benedetto Pistrucci died at Englefield Green on September 16th, 1855. At Rome, in the Academy of St. Luke, may be seen the casts of the Waterloo medal. Many of his precious wax models are in the possession of his family, to whom many offers have been made for their purchase. Among the many groups and

figures in wax, I must mention Napoleon III., the Coronation of Queen Victoria, George IV. in Ireland, George IV. in Hanover, the Empress Eugenie in England, and an equestrian figure of George IV.

Such was then, briefly, Benedetto Pistrucci, who lived in an epoch when the classical taste was universally robust, and of which taste he was one of the greatest representatives in England.

## SPAIN:

### Picturesque Cities & Monasteries in the North.

#### No. IX.—BURGOS.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 355, No. CCXXXII.)

In the house of the Conde de Villariego, which was built in the tenth century, the great Alvaro de Luna was imprisoned. In the town hall, a building in the Plaza Mayor, is a collection of antiquities, which include some ancient metal and enamel work, Moorish arches, and sculptured tombs, and the bones of the Cid enclosed in a sort of urn made of walnut wood. The principal gate of the city is the Arco de Santa Maria. It is a portion of the ancient Gothic fortifications, and was decorated by Charles V. with his own statue, surrounded by five others of Burgalese worthies, grouped in niches. These worthies are Diego Porcelos, who founded the city in 884, Fernan Gonzalez, The Cid, Nuño Rasura, and Lain Calvo, the last two judges in the period before Gonzalez.

Passing out under this gate and crossing the river Arlanzon, one reaches the Esplanade, gardens laid out with walks under the shade of tall trees. A little way on, following the road to Valladolid, the convent of Las Huelgas appears. It was founded by Alfonso VIII. in 1180 for his Queen, Leonora, daughter of Henry II. of England, on the site of some pleasure grounds, whence the name. The church was consecrated in 1279, and was the work of Ferdinand III. Santo. It is good, pure Gothic, but has been much added to and altered. It contains a gilded iron pulpit, destitute of structural steps, with repoussé panels, from which St. Vincent Ferrers preached. The church also contains the banner of Alfonso VIII. which waved at Las Navas de Tolosa. Through a grating one looks into the nun's choir. At high mass on Sundays the nuns may be seen seated in the finely carved stalls, but not at any other time. The abbesses used to be most powerful, and were inferior in dignity to no one save the queen, having power of life and death over the dwellers on their extensive property. The building was intended as a burial house for the Kings of Castile, and here are the tombs of Alfonso VII., Alfonso VIII. and his queen, Alfonso the Wise, Enrique I., and others. In this church took place the marriage of the Infante de la Cerda with Blanche, daughter of St. Louis of France, at which were present the Kings of Castile, Aragon, and Navarre, the Moorish King of Granada, Prince Edward of England (son of Henry III.), the Empress of Constantinople, the French Dauphin, and twenty or thirty other crowned heads and princes. In the interior is the Chapel of Belem, which is built in a sort of transition style, between Gothic and Moorish, and a cloister called La Claustrella, a part of the founder's palace. There is in the chapel of Santiago a figure of the saint, which moves its arms by means of springs, which on some occasions placed the crown on the heads of Spanish monarchs, and in the sacristy is a pretty little fountain in the centre of a room.

Turning the other way, at a distance of about two miles, is La Cartuja, the Carthusian convent of Miraflores, which dates from 1441. It was built on the site of a palace of Enrique III. by his son Juan II. for a royal burial place, but having been burnt in 1452, was restored by Enrique IV., and finished in

1488 by Isabella the Catholic, after designs by Juan de Colonia in florid Gothic. She also raised the magnificent *retablo*, the *Coro*, and the sepulchre of her parents, which is one of the wonders of the world. The sculptor was Maestro Gil de Siloe, the father of the Diego who designed the staircase in the cathedral, and it was completed in 1493. Here lie Juan II. and his second wife, Isabella, and his son the Infante Alonso, who died at Cardenosa in 1470, thus opening the succession to his sister. The Infante kneels at a *priedieu*, in front of a richly-diapered background. He is within a niche, which is bordered by an elaborately designed lacework of vine stems and leaves, amid which little genii disport themselves. On the base are angels supporting coats of arms, and rising in front of the effigy and occupying niches flanking the arch are smaller statues. Above the arched niche the mouldings are still more enriched, and the tympanum has a small group sculptured in high relief. The point of the arch, which is ogee in shape and enriched with wonderful crockets, rises to a sort of pinnacle, as do the side piers, all bearing figure sculpture, the space behind them being filled with panelling. It is protected by a wrought iron grille, enriched with armorial bearings in colour.

In front of the high altar is the monument to Ferdinand II. and Isabella, carved in white marble, and looking as if it had been made yesterday, save for the damage wrought by the French. The figures lie side by side, separated by a crested and pierced cloison, with a canopy at the head and figures of lions at the feet of each. The plateau upon which they rest is of the shape of two inter-penetrating squares set anglewise to each other, and on the projecting angles are placed small seated figures. From each inward angle rises a small shaft bearing a standing figure. All round runs a border most elaborately carved and undercut, with the same *motif* of vine leaves and little genii, with shields and little angels at the angles. The base is also elaborately worked with

figures in niches under beautiful canopies, and with pierced buttresses, and lions supporting coats of arms and royal crowns. In the principal figures the detail of embroidery and pattern on the robes and jewel work in collar and border is most exquisitely rendered, the whole work being just on the line which divides extravagance in detail from extreme richness. In this case the heads and hands of the figures are so well and delicately worked that the flesh keeps its place, and the eye goes direct to the most important part. The whole monument is surrounded with a well designed railing, with standards of pierced work at each angle surmounted by prickets for tapers. It is crowned with a pierced cresting of most beautiful design, enriched with coats of arms at intervals, which are coloured.

The *reredos*, though on the whole an impressive work, and containing a specially fine crucifix, is scarcely architectonic enough in its design, and looks almost as if made at two different times. The crucifix is surrounded by a circle of angels, the quarters being filled in with scenes from the Passion. The rest is covered with subjects contained in circles, and with many standing figures beneath canopies, the whole being surrounded by an elaborate, lace-like border interrupted at the top by more figures under canopies. It was finished in 1499, and gilt with gold brought from America in the second journey of Columbus. The fine prior's stall was carved by Martin Sanchez in 1488. The church is divided into three parts by *rejas*—the monks' choir, the lay brothers' choir, and the part allotted to the people.

**British Archaeological Association.**—The members of the British Archaeological Association met in congress for several days last week, at Buxton, and visited various places of interest around the town, addresses being given on the history and architecture of each. Papers on various subjects were also read.

## ARCHITECT v. ARTIST.\*

By J. JERMAN, F.R.I.B.A.

IN this short paper my desire is to investigate the particular object in view which actuates many architects of the present day in tacking on a lot of subordinate titles and qualifying expressions to the distinguished and comprehensive title of "Architect." There are many varieties of qualifying titles, all, I assume, more or less intended to "catch the eye" of the public; in plain language, an aggressive advertisement pure and simple. It would be out of place in a short paper to attempt to state and consider the number of appellations actually used by the architectural and allied professions. Before going into actual definitions, one may refer to the rigid line drawn by artists themselves in the departments of graphic art. A sculptor, a painter, an engraver, as a rule, considers his own department sufficient for his concentrated efforts. I say as a rule, because there have been, and always will be, notable examples of men, great in every sense of the word, whose powers have enabled them to excel in more than one of the recognised branches of art. I need only here refer to Raphael and Michael Angelo as notable examples. In these modern days, however,

### A Professional Man's Particular Sphere of Work

becomes more limited, and he is, more or less, strictly tied down to the sphere of his own operations, the only opportunities of individualising his work, as a rule, being to specialise in one or more departments. This tendency to specialise, as far as my experience is concerned, limits the practice, and prevents the specialist from standing on all fours with the man who has an "all round" knowledge of the profes-

\* A paper read before the Devon and Exeter Architectural Society.

sion. I hold, however, that it is not possible to separate the divisions of an architect's work. The preparation of drawings and designs, however skilfully and artistically executed, does not make an architect, and *per contra*, the knowledge of construction and business matters alone does not fulfil the conditions necessary for making an architect. It may be urged that no person would seriously contend that one who has the necessary skill in draughtsmanship alone would pose as an architect—yet there are many who would leave the "business" part of the professional work in other hands—holding that the working out of formulae, the nature of materials, the superintendence of work and the preparation of accounts can well be left to others. This tone of mind seems to be the prevailing one amongst many who wish to rid our profession of

#### The "Business" Side.

It seems to me that such a position is untenable, and that there is no parallel to such a position in other professions. It may be urged

to detract from the important duties following on the development and execution of any building. The public have a very general idea that making "catchy" designs is the chief qualification of an architect, often forgetting the serious responsibilities devolving on architects in bringing their work to a successful issue; it is probably not such

#### "Taking" Work,

but infinitely more professional in the best sense of the word. It may be well at this stage to see what are the respective descriptions of each:—

*Architect.* We are told that the word means chief of the works, *i.e.*, chief builder. He is a professor of the art of building, skilled in planning and designing buildings. One writer observes "that the study of Architecture is to be ranked among the highest branches of human knowledge, has dignified the excellent among its professors, and has enlisted in its ranks enlightened men from every class of society." Grinlt says: "an architect is a

such who practise a liberal art after a liberal manner. From this it appears to me that

#### An Architect Should be an Artist

in the broad sense of the word, seeing that he is a professor of one of the fine arts, which he practises as an art; he does not mix up his work with trade, or lower it by assimilating it with the most sordid parts of commerce. In this sense "Artist" is a comprehensive term including many professions studying the fine arts, of which architecture is one. Why then introduce the term at all, seeing that the exact position of an architect is so well defined? Cannot we be content with the comprehensive title of architect? Is it necessary to throw a sort of glamour over the title by incorporating artist with architect, as if that could add lustre to an already famous title? The fact is apparent that the profession of architecture is a complex one, and I cannot do better to illustrate this than by giving the pith of

#### Mr. Norman Shaw's Argument

in his famous letter to the *Times*, summarised as follows:—That architecture is an art or precisely the same footing as painting and sculpture; that artistic qualities make an architect; that the scientific construction already exists in the engineer, the business man in the surveyor and commission agent.

So that if the public want an "artistic" work of architecture, they must employ three men, not one as hitherto, namely:—The artist to design, the engineer to construct, and the surveyor to do the "business." But which architect is not clear!

All this "one-sided" view of an architect's work is reflected in the exhibitions of the Royal Academy, where it is exceedingly rare to see an architectural drawing, the exhibit for the most part being by

#### Professional Draughtsmen

("artists"), who work for architects, men, pictures, more or less true to the results. To return to our subject: Architecture is an art as well as a science, and the architect who holds he is chiefly artist, or all artist, ignores the factor which helps to make the whole.

To sum up:—I wish to state (1) that additions or qualifications to the title of architect is altogether unnecessary; (2) that the assumption of such titles as artist-architect or specialist, on the purely *art* side of the profession, detracts from the dignity and completeness of the title of architect; (3) that the artistic faculty, fully allied to trained constructive ability, together give the qualifications necessary for making a true architect.

DRAWN BY F. HAMILTON JACKSON, R.B.A.

that engineers sub-divide their work into mechanical, electrical, naval, and other sorts of engineers. This, however, is only a differentiation of work, all based on the same leading principles. But the divorce, the entire separation of the smaller branches of our profession, seems to me to be an impossible condition, as the preparation of the design and the execution thereof, is, and should be, inseparable if one master mind is to fulfil the whole work. The tendency to treat the designer as an independent and superior individual unnecessarily puffs up one phase of our work and endeavours

person competent to design and superintend the execution of any building."

*Artist.* Now as to the artist, he is broadly speaking the professor of an art, and is distinguished from the workman. An artist is one who professes or practises a liberal art; hence the mason, carpenter, smith, decorator, cabinet-maker, are artisans, but the architect, sculptor, painter, engraver, &c., are artists.

The word "Artist" has been used in rather a loose manner, and it follows that the honourable title of artist should only be allowed to

**The Birmingham Association of Mechanical Engineers** visited London recently to inspect some of the engineering work and objects of engineering interest. They inspected the Blackwall Tunnel and the works of Messrs. Maudslay, Sons and Field, Ltd., who are supplying the Belleville boilers to a large number of battleships. After dinner a visit was paid to the works of Messrs. Humphrey Tennant and Co., who are building some large marine engines for the Japanese Government, and subsequently to the Tower Bridge, permission having been secured to inspect the machinery.

**The Excavators in the Roman Forum** discover something of antiquarian interest nearly every day. A discovery of importance was made recently by Signor Giacomo Boni in the Forum, on the site of the Basilica Æmilia. Five or six huge blocks of white marble were found in the positions which they must have occupied since falling from the façade of the original structure. One of these blocks, which is broken into two parts, bears an inscription, stating that the Basilica was restored in the fourteenth year of the reign of Augustus by Tiberius, son of Augustus, and nephew of Divus Julius Caesar. The discovery of this important fragment on the outskirts of the area now in course of excavation constitutes evidence that the remainder of the edifice will shortly be brought to light. Some of the blocks discovered bear traces of fire. Several columns of red Egyptian granite were also unearthed on the same spot.

## "BUILDERS' JOURNAL" COMPETITION.

DESIGN BY "PIPPA."

WE reproduce this week in one of our inset plates the design for a Country House submitted by Messrs. W. L. Downton and Alick Horsnell ("Pippa") in our recent competition. The following explanatory notes accompanied the design:—

GROUND FLOOR contains the following rooms and offices:—Dining room, study, boudoir, hall sitting-room, with gallery over and ingle nook to fireplace, so designed that it may well be used as a sitting-room. The stairs are so placed so as to lead up to the bay window, the floor of bay being level with the landing. The bay could be utilised for comfortable window seats. The main entrance is at the other end of hall, and opens into same from a paved porch. To the right of the entrance there is a lavatory and w.c., approached through an archway, which cuts them off from the hall. The passage through this archway also leads to the kitchen, scullery, servants' offices and back stairs. The scullery opens onto a covered way, with a yard adjoining.

The internal decorations of principal rooms will be of simple character, the woodwork generally being finished white.

FIRST FLOOR.—This floor contains six bedrooms, and the best bedroom with bath dressing-room adjoining. There is also another dressing-room. The other bath room is so placed as to be central with remaining rooms. Housemaid's closet and w.c.

ATTIC FLOOR.—Three bedrooms for servants, box room, cistern room.

Note.—The sizes of principal rooms will be found to be figured on the drawings. The heights are as follows:—Ground floor to ceiling, 8ft.; first floor, 8ft.; rooms in roof, 8ft.

DESIGN.—The building has been so designed as to give it a quaint and picturesque appearance, due care being taken in placing the principal rooms so as to command a fine view, and as far as possible a warm aspect.

MATERIALS.—We have provided 18in. external walls to front and back elevations up to first floor, and the remainder 14in. all finished externally with rough cast. The half-timbered projection on S.E. elevation would be constructed in oak and rough cast.

Note.—Hollow walls can be substituted externally if desired.

The windows, with the exception of the bays and entrance windows, are to have wood frames and iron casements, and will be glazed with leaded lights. The other windows to have stone dressings and iron casements. The porch, &c., is to be paved with stone slabs, and a seat is provided at each end of same. The pent over porch would be covered with lead. The roof will be thatch composed of wheaten straw. The chimneys are finished with stone caps and bands.

FLOORS.—Wood block flooring would be used for ground floor rooms, and it is proposed to tile such as scullery, larder, w.c., and lavatory.

The yard and coal cellar would be brick on edge.

ESTIMATED COST.—Cubic contents of building, 56,024 at 8d. = say, £1,880; yard, £50; total, £1,930.

**Electric Lighting at Radcliffe.**—Colonel Marsh, R.E., inspector of the Local Government Board, held an inquiry last week at the District Council Offices, Radcliffe, into an application made by the Urban District Council of Radcliffe for sanction to borrow £16,000 for the purchase of land in Irwell Street, and the erection thereon of an electric light station, together with distributing mains, &c., the amount borrowed to be repaid in thirty years. There was no opposition. The £16,000 will cover plant sufficient to run 4,000 eight-candle power lamps, and the summary is as follows:—Buildings, £2,750; boilers, engines, and dynamos, £3,702; station electrical plant, £870; feeders, distribution mains, &c., £7,060; land, £1,100; contingencies, £518; total, £16,000.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### LIABILITY FOR DAMAGE TO NEIGHBOURING PREMISES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—A. and B. have adjacent plots of building land on chief rent. A., a few years ago (twenty perhaps), built a three-storey uncellared workshop close on his side boundary, and his footings are only 12in. deep. B., who has only just purchased his plot, desires also to build right up to his boundary so that the two side walls will touch; but cellars are wanted, and the foundations will be 5ft. below those of A. The land is sand, and possibly even with the greatest care some slight damage to A.'s gable may result. Will B. be liable?—Yours, &c., M. M.

Yes, if A.'s house is twenty years old.—H. P. B.

### MEASURING-UP PLASTERING.

To the Editor of THE BUILDERS' JOURNAL.

FELTHAM.

SIR,—Will you kindly recommend me a work upon measuring-up plastering? I am given to understand that four mitres only are allowed in a room, and that all others count extra. It is this sort of thing that I wish to master.—Yours, &c., SPREAD.

It was formerly the custom only to count mitres above four in a room, but this practice is now not always followed. All mitres and stop ends should be numbered. Mitres and stops over four in number are generally charged each at the price of a foot, lineal or superficial, of moulding. Instructions in measuring plasterers' work and squaring dimensions are given in "Plastering Plain and Decorative," published by B. T. Batsford, 94, High Holborn, London.

WILLIAM MILLAR.

### CONSTRUCTION OF BREWERIES, &c.

To the Editor of THE BUILDERS' JOURNAL.

CHIPPENHAM, WILTS.

SIR,—Would you kindly inform me what are the best works and their prices on the planning and construction of breweries, malthouses, warehouses, &c., from the point of view of an architect who wants information of the subject?—Yours, &c., S.W.

The only book we know of on any of these subjects is "Brewery Construction," containing chapters on breweries and maltings, their arrangement, construction, machinery, and plant. The author is G. Scammell, F.R.I.B.A., F.G.S. The second edition has been revised, enlarged, and partly re-written, by F. Colyer, Mem.Inst.C.E., Mem.Inst.M.E. The cash discount price of the book is 10s. 6d., post free, and can be obtained from Mr. B. T. Batsford, of 94, High Holborn, W.C. No recent book has been published on the construction of warehouses.

### TAKING OFF QUANTITIES.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, N.W.

SIR,—In your review of "The Student's Guide to the practice of Measuring and Valuing Artificers' Works," which appeared in your issue for July 5th, the following passage occurs:—"In London, particularly, the system of 'taking off' in trade sequence has long been abandoned in favour of the group system." Will you please explain the "trade sequence" and the "group system"?—Yours, &c., G. S.

An exhaustive reply to this apparently simple question could only be given in a series of articles, or an entire volume, devoted to the subject of quantity surveying. Possibly it

may suffice, however, for present purposes, to state that under the "trade" system quantities were "taken off" almost in bill or specification order, trade by trade, little use being made of an "abstract." Some surveyors would even go so far as to follow the specification item by item, thinking that thereby the liability to error was reduced to a minimum; but in reality the possibility of omission was considerable, except in works of the very smallest kind. Under the "group" system, which is developed differently in different offices, the trades are allowed to run into apparent confusion on the "dimension" sheets, the "abstract" becoming of extreme importance for the purpose of arrangement into trades for the eventual bill. For example, when a doorway and door are being taken, they would not be left until everything connected with them had been "taken off"—first, the deduction of brickwork, then the relieving arch, the lintol, the jamb linings or frame, and the door itself with its hinges, lock, and furniture.

THE REVIEWER.

### OWNERSHIP OF WORKING DRAWINGS AND DETAILED ACCOUNTS.

To the Editor of THE BUILDERS' JOURNAL.

CHESTER.

SIR,—I shall be glad of replies to the following:—1, Can a client legally claim the original working drawings, specification and contract, as soon as he has paid his architect's account for professional services rendered, but before the builder has been paid his balance? 2, Can a client claim these documents if both the architect's and builder's accounts have been settled? 3, Is it usual for an architect to furnish detail particulars of his account if requested so to do?—Yours, &c., P. A. S. I.

1, Yes. 2, Yes.—H. P. B. 3, The request is one which it is almost impossible, and certainly impolite, to refuse, and which is certain to be made by public bodies, if not often by private clients.—G. A. T. M.

[We shall be pleased to insert opinions on these points from any of our readers who may have different views to the above.—Ed. B.J.]

**Errata.**—In the article on the Central School of Arts and Crafts, which appeared in our last week's issue, "Astin" Whiting should have been "Aston;" Charles "Spinner," "Spoooner;" and "Netch" design, "Vetch."

**The Restoration of Sidcup Parish Church.**—Dr. Tristram, Q.C., Chancellor of the diocese of Canterbury, held a court last Thursday at the parish church, Sidcup, Kent, in reference to a faculty for the rebuilding and enlargement of the parish church there. Several witnesses were examined, and the Chancellor gave special directions as to the removal of the remains of twenty-one persons, and the preservation of over thirty memorial tombstones. The work, when completed, will cost £10,000.

**A Statue of Washington at Paris.**—A body of American ladies are desirous of presenting an equestrian statue of Washington to the Municipality of Paris. The monument is in bronze, and has been sculptured by Mr. Daniel French, the height of the statue, including the pedestal, being close on 10 metres. The question is to know where to erect the monument. The preference of the donors is to have it in the Avenue Bois-de-Boulogne, facing the streets Chalgrin and Rude. This site the Administration will no doubt grant.

**Hexham Abbey Church.**—Mr. Turner, Secretary to the Society for the Protection of Ancient Buildings, states that the Society examined the fabric of Hexham Abbey Church in December last, and forwarded a report on its condition to the Rector. The examination, Mr. Turner says, revealed a serious state of things, several points of weakness having produced movements in the building, which it is feared are still going on, and which are shown by extensive cracks. It was urged in the report that the first money expended should be devoted to securing the foundations.

## FOLKESTONE PIER.

### EXTENSION WORKS.

AN interesting and instructive visit was made by over fifty members and associates of the Society of Engineers, last Tuesday week, to the Folkestone Pier extension works. These works comprise the extension, widening, and strengthening of the existing pier, and are being carried out from the design and under the control of Messrs. Coode, Son, and Matthews, Mr. W. Rigby being the contractor for the work, Mr. H. T. Ker the resident engineer, and Mr. J. Grice the contractor's agent.

The existing pier is being extended for a length of 900ft., 300ft. of this being in continuation of the line of the present work, and 600ft. canted at an angle of 36deg., so as to form a sheltering arm. The extension of the pier is composed throughout of Portland cement concrete blocks, weighing on an average seventeen tons, the heaviest blocks used being twenty tons. The work is built from a staging, covering the width of the pier, in two spans of 53ft. The centres of the spans longitudinally are 40ft. apart.

When the work covered by the innermost bay is completed and the girders are available, the staging is taken down and re-erected at the outer end. Piles, 18in. square, in clusters of four and six, are driven to form dolphins, this being accomplished by steam winches from cantilever pile engines. When the dolphins are completed, the lattice girders, which have been removed from the inner end, are floated out on a barge and lifted by the piling winch into position. The road on top of the girders is then laid, and the pile engines are ready to be run out for the next bay. Upon the top of the staging there are four travellers or Goliaths; the two outer ones, from which the diving bells are suspended, are capable of dealing with a working load of 30 tons. The two inner travellers are used for block-setting only, and their maximum working load is 20 tons.

The mode of procedure adopted for preparing the foundation is as follows: The sand, shingle and soft material are removed by 1½ cubic yard grabs, worked from the 30 ton travellers. After the soft material has been removed, the bells are lowered, with four men in each, to excavate the hard stratum and to level it so that the foundation blocks may be set on a perfectly level and even bed. The diving bells are 12ft. 9in. by 10ft. 6in. by 6ft. 6in., and weigh 26 tons. When the beds have been prepared, the 20 ton travellers, which in the meantime have been working at a higher level, are brought forward to set the foundation blocks, after which the bells resume work.

The work is brought up in lengths of about 60ft. at a time. The blocks in the underwater portion of the work are laid block on block without mortar joints, and the face blocks are joggled together and to the next blocks in from the face by round concrete joggles, which are deposited in bags by divers. Above L.W.O.S.T., the outer blocks are faced with granite blockers, and the blocks are bedded in mortar and the joints grouted.

Berthing places for the steamers are provided, and these have two landings, one at cope level, for use at high tide, and one at 13ft. below cope level, for use at half and low tide. The upper landing is supported by greenheart piles, which carry girders to form the deck. A sheltering parapet will be built on the west side of the pier, covering the railway platform, for the protection of passengers during rough weather. The level at which the pier is now being founded is 34ft. 3in. below L.W.O.S.T., and at the extreme end of the pier the depth of the foundation will be 42ft. below L.W.O.S.T. The total height of pier at the head, from foundation to top of parapet, will be 86ft. 6in.

The blocks for the pier are made in a yard conveniently situated. The concrete is made by two of Messent's mixers, each of one cubic yard capacity. It falls from the mixer into a hopper, from which it drops as required into

Decauville wagons, which run on staging fixed at a height sufficient to allow the wagons to tip freely over the top of the block moulds. The moulds are struck three days after a block has been made, and the block, when six days old, is lifted by the yard traveller and stacked. The blocks remain in the stacking ground for four weeks, and are not set in the work until they are five weeks old. The cement shed has a capacity for 1,300 tons. It is divided into 100 ton bins, and each bin is large enough to give room for turning.

Subsequently, the members of the society paid a visit to the site of the sinkings for the Dover collieries, and went over the works.

## Views and Reviews.

### THE MATRICULATION DIRECTORY.

This directory for June 1899 has just been published, and deals with the examinations of the London University for January and June 1900. The calendar for 1898-9 of the University Correspondence College is bound up with the directory. This college is now the recognised head of all preparatory institutions for candidates for the examinations, and anyone going in for them would do well to buy the directory, which gives most useful hints to the student. The directory itself contains articles on the matriculation regulations, text books for study, special subjects for January and June 1900, and the papers set at the examination held in June last, with solutions to them. These solutions must prove very helpful to the student, for they are clearly and well written.

"The London Matriculation Directory: No. XXVI., June 1899. With Special Articles on the Special Subjects for January and June 1900." Price 1s. net. London: W. B. Clive, University Correspondence College Press, 13, Booksellers' Row, Strand, W.C.

### FOR WOODWORKING STUDENTS.

It is a hopeful sign of the times that the artisan and craftsman more fully appreciates the value of drawing, and that facilities are now more fully granted him for studying this subject. A book might easily be filled with a recital of the advantages of drawing to all and sundry, and to the artisan in particular. So far as geometrical drawing is concerned, it has always, of course, been quite understood that some knowledge of this subject is an absolute necessity, as much to the craftsman as to the architect; but even in this branch there is much room for improvement, though we are free to admit that in the ranks of the masons and carpenters are to be found practical geometricians of no mean order.

We look forward to the day, which we believe to be not far distant, when freehand drawing—the training of the eye and powers of observation—will take its proper place in the usual training of the craftsman.

The City and Guilds Institute, the Company of Carpenters, and the Technical Education Board of the L.C.C. recognise, to some extent, in the examinations which they hold, the value of geometry to the carpenter and joiner, and for the purpose of assisting students to pass these examinations these "Notes on Carpentry and Joinery" (Vol. I., Elementary Course) have been compiled by Mr. T. J. Evans. A syllabus issued by the City Guilds, and one issued by the Carpenters' Company, have been taken as a guide in arranging the book, and specimen examination papers are given, with answers to some of the problems.

Such a book as this, compiled for such a purpose, must necessarily have its limitations and defects. Knowledge acquired by such means is generally swallowed unthinkingly and never digested. The process is too much akin to "cramming."

Considering that this work is limited to preparation for certain examinations, it is evident that if they are partial, incomplete or one-sided, the book must share their defects. However, taking it as we find it, and considering its avowed object, we think it will be found useful for its purpose. The author starts off with a chapter on draw-

ing instruments and material, and some hints on drawing, which will be found useful by the beginner, though we should like to take exception to such things as the use of HHH pencils, and the habit of sharpening them like a chisel. Also to the method given for mounting paper; ordinary glue is a terrible thing to use for this purpose, the paper has to be cut up, and the board is ruined. Mouth-glue, though rarely used in this country, is the best, it is cleaner and handier, and the paper can be taken up without tearing by running a thin knife blade under its edges. In damping a sheet of paper it is sufficient to wet one side only, the under side, which preserves the surface on which the drawing is to be made. Before being laid down it should be stretched.

It is impossible to follow the author in detail through the whole of his book, which gives chapters on various phases of plane geometry, such as proportionals, the properties of circles, scales, the construction of polygons, conic sections, areas of plane figures, &c., &c.; and again on solids, and isometric and oblique projection, illustrated by the ordinary joints in carpentry. We then get the practical setting out of windows and doors, and the construction of roofs, floors, and partitions. Several chapters are also devoted to graphic, arithmetic, and mechanical contrivances, stresses in framed structures, shearing stress, bending moment, systems of measurement, mensuration, &c., and the book ends up with a chapter on a few of the ordinary kinds of timber.

Although one can hardly expect such a text book as this to be a masterpiece of literary art, yet one can—without being hypercritical—call attention to the loose and careless way in which much of it is written. This carelessness is most noticeable in the chapter on timber, which, being more descriptive in character, demands greater care in the construction of the sentences. For instance, we read, apropos of Northern pine: "Scotch fir because it is frequently found in Scotland, of which it is supposed to be a native of the highlands." Again, apropos of teak: "It has the peculiar property of containing a resinous oil which preserves iron fastenings, and that of resisting the attack of ants." Is it the oil that resists the attack of ants, or is it some other property of the wood? Again: "The walnut is extensively used by the cabinet maker for innumerable purposes, both of an ornamental character as well as for articles of utility. The burred walnut, and that of the roots, are cut up into veneers."

We have frequently had occasion to express our dissatisfaction with any system of education designed simply to enable the student to pass a given set of examinations. We have always held that such is no true education. It is therefore impossible for us to approve of the method and aims of the great number of text books which are now being brought out. Doubtless there is much useful information to be found in their pages, many practical labour-saving methods for the use of the artisan and much knowledge that he is bound to acquire; but the student who uses such books must bear in mind their limitations, and realize that, however much he may learn from them, he is not necessarily educating himself thereby. They rarely teach him to think for himself.

A. R. J.

"Notes on Carpentry and Joinery," (illustrated) By Thomas Jay Evans. Vol. I. Price 7s. 6d. London: Chapman and Hall, Ltd.

The Site of St. Mary's Church, Moorfields, E.C., has been sold for £202,000. It is expected that £100,000 of the amount realised will be devoted to the completion of the new Roman Catholic Cathedral at Westminster.

The London Hospital New Medical College Building was formally opened last week by Lord Knutsford. In the basement of the new structure is the department of public health, professors' room and class rooms. The ground floor contains the biological laboratory and museum. On the upper floors there are laboratories, theatres, and class rooms. The new buildings, with the fittings, will cost about £10,000.

## Correspondence.

### TYPEWRITERS FOR SURVEYORS.

G. F. S. (Nuneaton), referring to Expedition's inquiry in our issue of July 12 for the name of a good typewriter for use in a surveyor's office for typing schedules of quantities, writes: "I can, with confidence, recommend the 'Empire,' with which I have taken from six to a dozen carbon copies at one time. This typewriter is a most powerful manifold. It has visible writing, and its cost, including office case, is but £13 2s. 6d."

E. R. (Sevenoaks) writes: "Having used an 'Empire' typewriter in an architect's and surveyor's office for over twelve months, I can speak with confidence respecting its sterling qualities as a reliable duplicator, both for stencil and carbon work. I have written several bills of quantities with it, the last one, which I finished a week ago, consisting of over eighty pages. It is eminently suited for this class of work, as every letter is visible to the eye of the operator immediately he has struck the key, and at the same time it is almost impossible for it to get out of alignment."

### THE REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—If, as may be inferred from your having published the opinions and letters from well-known London architects in your last issue, this correspondence is likely soon to be closed, I would ask the favour of your indulgence once more. Anyone who has carefully followed the matter must have been struck with the practical unanimity of opinion expressed as to the desirability of Registration, and this also applies to the remarks of those whom your representative has interviewed, though it is obvious that some of them have not studied the question as it deserves, and have been unprepared or unwilling to commit themselves to any very definite opinion. Nothing is easier than to criticise and express opinions which a little reflection would considerably modify. One gentleman suggests amalgamation of the advocates of the Bill with the R.I.B.A. Well, it will be remembered that the Society of Architects has always insisted that the Institute is the proper body to take up the question, and it is for them to take the first step towards co-operation, and our object in holding provincial and other meetings on this question is to show that provincial architects, at any rate, really desire registration, and to urge the Institute to take the matter up. It would be interesting to learn how many of all those who oppose the measure have read the Bill carefully; and if it is the principle and not merely the Bill they object to, then their opposition can only be the result of self interest, and not of real conviction. Now, what is to be the result of all this correspondence? Is it to be merely a flash in the pan, and the matter to then drop, or is something practical to result? Surely the latter. To me it is incomprehensible how any society or individual can be so inconsistent as to express by resolution and statement their or his approval of a principle, and yet not be prepared to back it in a practical way. What is it which holds back architects, more particularly members of the R.I.B.A., from plain speaking in this matter? What have they to fear from the Institute? Surely it is not a misdemeanour to hold different views from those in high places, and who in many instances have neither the inclination nor desire to face the question or to take a definite stand either one way or the other. The opponents of registration make a fatal mistake in ignoring or undervaluing the importance of this question, or of supposing that the profession will much longer be content with the present order of things: the coming generation is a power to be reckoned with; the time has gone by for half-hearted measures; dogged does it, and the framers and supporters of the Bill have already overcome too many difficulties to be easily turned from the path they have marked out for themselves. There can be no

two ways about the matter: either we do or we do not want registration. The Society of Architects do not desire to force the matter on the profession, but they do point out the evil and show a practical cure, and knowing well that their efforts must eventually be crowned with success, go on their way with unabated determination.—Yours, &c.

C. McARTHUR BUTLER,  
Secretary of the Society of Architects.

## Keystones.

**A New Wesleyan Chapel at Ilkley** was opened recently. It is a corrugated iron structure, lined with wood, and has cost about £200.

**Mr. Herbert E. Bellamy, M. San. I., M.S.I.**, of Truro, has been appointed Surveyor to the Northam (N. Devon) Urban District Council.

**The New Church Schools at Kidderminster** will accommodate 250 children, and will cost nearly £2,000. Last Wednesday evening the Bishop of Worcester laid the memorial stone.

**The Ancient "White Hart Hotel,"** situated in Cornmarket Street, Oxford, is about to be rebuilt from designs by Mr. Stephen Salter, F.R.I.B.A., of Oxford, Maidenhead and the Isle of Wight.

**The National Eisteddfod of Wales** was opened on Tuesday, last week, by Professor Herkomer. The judges in the Competitions in Art Subjects are Sir Laurence Alma Tadema, R.A., and Mr. Goscombe John, A.R.A.

**Munificent Gift to a Rhyl Hospital.**—The Duke of Westminster has presented the sum of £10,000 to the Royal Alexandra Hospital, in order to enable the Committee to proceed at once with the erection of the administrative block.

**The New Nurses' Home of Queen Charlotte's lying-in hospital, in Marylebone,** was opened last week by the Duke and Duchess of York. The cost of the building, which is of red brick and terra-cotta, including the furniture, has been about £12,000.

**The Memorial Stones of a New Baptist Chapel in Bradford** were laid recently. The new chapel is to be built in Carlisle Road, and will be in modified Gothic style. It will accommodate about 800 persons, and the school buildings adjoining are to hold 550 scholars.

**A New Free Library for Leeds.**—The Leeds Free Library Committee have decided to advertise for designs for a new library at Stocks Hill, Armley. The cost of the building is not to exceed £5,000. In addition to the library, there is to be a general reading-room, a boys' reading-room and a ladies' reading-room.

**A New Mission Chapel at Swanland** is now being erected. The chapel is being built of red bricks, with gable ends filled with timber work. The roof is to be covered with red tiles, and furnished with a bell-cote. The estimated cost of the building is £840. The architects are Messrs. Brodick, Lowther and Walker, of Hull, and the builder is Mr. Kirby, of Swanland.

**A New School at South Levenshulme** is being erected, from designs by Mr. W. E. Stelfox, by Mr. George Macfarlane. The building is to be of brick, faced with Accrington bricks throughout, with stone dressings. School accommodation will be provided for 200 children, and there will be a mission room to hold over 300 persons. The estimated cost of the building is £1,600.

**Bungalow at Sleights, Yorkshire.**—Mr. Fletcher, builder, of Whitby, has commenced the erection of a large one-storied bungalow at Sleights for Mr. J. Brooks, of Whitby. The walls will be executed in pressed bricks and timbered gables. The site overlooks the River Esk. Higher up the village, Mr. G. Wallace's bungalow, built of stone, is nearing completion. Mr. G. Scaife French, of Whitby, is the architect of the buildings.

## A CURIOUS COMPENSATION CASE.

IN the Queen's Bench Division, last Thursday, before Mr. Justice Darling and a common jury, the case of Endacott v. Snow and Mackay and Co., Limited, was heard. This was an action by Mrs. Rowena Endacott, a widow, to recover damages for personal injuries, alleged to have been caused by the negligence of the defendants or their servants. The defendant Snow is a builder and contractor, and the defendants Mackay and Co. own a stationer's shop at New Brompton, Kent. The plaintiff's case was that on November 29th last she went to the shop of Mackay and Co. to get some writing-paper, and was told to call next day for it. Next day she called at about four o'clock, opened the shop door, and fell into a hole in the passage behind the door and broke her leg. It was admitted that there was a hole in the passage behind the door, the boards having been cut away for the purpose of lowering the floor; and that one of Snow's workmen was at work at the time on the job, under instructions from Mackay and Co., Limited. The evidence for the plaintiff went to show that there was nothing in the appearance of the shop to lead her to suppose it was closed, or that there was a trap at the back of the door.—The manager of Mackay and Co. was called for the defence, and stated that before Snow's workman came to do the work he pulled down the blind of the door and bolted it.—Snow's workman was called, and admitted that the door was bolted when he came to work upon the floor, and that he unbolted it, as he had to open the door in order to get more light just before the accident.—Mr. Kemp, Q.C., for the defendant Snow, contended that there was no negligence or breach of duty on the part of Snow's servant. It was necessary for him to open and close the door in order to do the work for the defendants, Mackay and Co. If there was any negligence it was on the part of Mackay and Co. in not giving proper warning. Mr. Robson, Q.C., for the defendants Mackay and Co., contended that as the shop was closed there was no invitation to the plaintiff to come in. So far as Mackay and Co. were concerned, they had done what was necessary to close the shop by bolting the door and pulling down the blind. Snow was liable if anyone was, as the unbolting of the door by his servant led to the accident. Mr. Rufus Isaacs, Q.C., for the plaintiff, contended that there was a clear case for both defendants. It was Mackay and Co.'s duty to put up a rail in front of the door, or notice stating that the shop was closed. He could have taken proper precautions to prevent anyone entering the shop, and had not done so. With regard to Snow, his servant had admitted unbolting the door, which enabled the plaintiff to fall into the trap. His negligence was clear. Mr. Justice Darling, in summing up, said the liability depended on whether the defendants or either of them did or neglected to do something which a careful person, under all the circumstances of the case, would have done. In conclusion he left the following questions to the jury:—(1) Were the defendants Mackay and Co. through their manager guilty of negligence? Answer.—Yes. (2) Was the defendant Snow through his servant guilty of negligence? Answer.—Yes. (3) Was the plaintiff herself guilty of negligence, but for which the accident would not have happened? Answer.—No. (4) Was the plaintiff injured by reason of the negligence of Mackay and Co., or Snow, or both, or either of them? Answer.—Yes. (5) Was the shop door being unlocked or left unlocked by Snow's servant a circumstance which made it negligent of him to unlock it or leave it unlocked? Answer.—Yes, but we think Mackay and Co.'s manager should have been there to see the shop was safe. The jury assessed the damages at £200. Upon these findings judgment was entered for the plaintiff for £200. The point of law upon the question of liability between Mackay and Co. and Snow was reserved.

## Bricks and Mortar.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

**"Stadacona,"** We illustrate this week in one of our centre plates, additions to "Stadacona," Stamford Hill. These additions comprise the professional portion of the residence of Mr. Theo. Hoskin, J.P., M.R.C.S. The house is in Amhurst Park, and has been considerably altered and added to, the principal internal alteration being the formation of a large hall in the centre of the house, by the removal of a small room, and lobby, which were of no importance. The additions are carried out externally in red brick, to correspond with the existing house, and the roof covered with Broseley tiles, the old roof being also tiled. The moulded work to chimney stack and window sills, &c., is of Portland stone. The porch, windows, bargeboard, and eaves cornice are of wood painted white. Internally the principal features of the waiting-room and consulting-room are the ingle-nook fireplaces, and the bay windows with fixed seats. The floors of the additional portion are of wood blocks stained to match the woodwork; that in the consulting-room and dispensary being "palm-leaf" green and in the waiting-room "American walnut" colour. The other woodwork in the halls, staircase and corridors throughout the house, is painted white, and the doors red, the darker tint being that of De Morgan lustre tiles, from which the colours of the paper are copied. The chimney-pieces for the new rooms and the new hall were supplied by Mr. Aldam Heaton, the grates by Messrs. Elsley and Co., and Messrs. Steel and Garland, and the fireplace tiles by Messrs. De Morgan and Co. The slips and fenders are of antique marble. Mr. T. W. Rhodes, of Stoke Newington was the builder, and Mr. Louis Ambler, A.R.I.B.A., of 7, Arundel Street, Strand, W.C., was the architect.

**Kew Bridge.** The view of this graceful structure illustrated in one of our central plates will in a few weeks be no longer obtainable. The work of driving in the piles of the temporary bridge is now rapidly being pushed forward, and as soon as this is completed the new work will be put in hand. It certainly is to be regretted that so graceful a bridge is doomed, but we are told the new one, from designs by Mr. E. Wolfe Barry, will in no way be inferior as far as appearance goes, and certainly in point of utility will be far superior. Until 1758 no bridge united the two counties, a ferry serving the needs of travellers, but in the following year an Act of Parliament was obtained authorising the erection of a bridge, the only one preceding the present. This was erected as private enterprise, and was largely built of wood, but the expense of repairing it made it necessary that a more lasting structure should be erected, and the present bridge was built in 1789. This structure of stone and brick has been an ornament to the river ever since. Our illustration is from the pen of Mr. H. F. Waring.

### An Old Coffin.

THE old oak coffin which we illustrate on this page is of French design and make, and is now in the South Kensington Museum. It is of 13th Century date and was purchased by the authorities for £100. Although the ornamental wrought-iron work with which it is strengthened is considerably broken and the woodwork is much battered, it is still a highly interesting and decorative piece of furniture. One peculiar feature which it possesses is that of having three locks, as can be seen from the three key-holes, one being in the centre and the others upon each side. The woodwork at the front and back corners is continued to form legs which raise the bottom of the chest, a desideratum in a chest used for the storage of valuables, both for safety and the preservation of the bottom from damp when standing upon an earthen or stone floor. South Kensington Museum is very rich in many similar artistic relics of bygone ages, which would repay the careful study of the present school of artists and craftsmen who are trying to improve our minor crafts, one of the most important of which is furniture-making. Unfortunately the present congested state of the museum militates against the careful study of many of these examples of artistic work through being crammed together in dark passages, but it is to be hoped that when the new museum is completed they will be given sufficient space to afford facilities for the proper study of them. Our illustration is from a sketch by Mr. Sydney Filmore.

### Mr. Walter Crane's Successor.

It is being asked who will be chosen for the thankless position of Principal of the Royal College of Art. Mr. Alfred Gilbert and Mr. G. C. Haité have been mentioned as suitable men, but the question is not so much who is suitable, as who will be allowed a chance of doing himself justice in the position. In the present state of affairs such an artist of standing as either of the two suggested would surely not accept the offer if he is to be bound over to endorse the action of those identical officials who have so freely stultified themselves in the past. Perhaps Mr. Haité is the best person to fill the vacant post. His qualities are well known, and as head of an art school which is supposed to exist principally for the training of decorators, he would probably produce results of the greatest importance. But to appoint him and give him no authority whatever would be a mistake. It would result in a direct loss to the art world, and South Kensington would be in the same condition as before.

### Bexley Heath Asylum.

At the usual meeting of the London County Council last week the Asylums Committee recommended "That the supplementary estimate for a further expenditure of £70,000 on the Bexley Heath Asylum be approved." The Finance Committee said this represented an increase of twenty per cent. on the original estimate for the building of the asylum. The Committee added that "In July of last year the Asylums Committee foresaw that the vote of £350,000 for the erection of the asylum would be exceeded, and warned the Council to that effect without giving any indication of the amount of the excess. The Finance Committee understand that the expenditure contemplated by the present estimate has in great part been already incurred, and they are of opinion that by the action of the Asylums Committee the terms of standing order No. 259 have not been fully complied with, and that the Council has not secured that financial control which it was the object of the standing order to provide." The report of the Asylums Committee which dealt with the matter was as follows:—"The estimate of the total cost, as now sub-

OLD OAK CHEST IN SOUTH KENSINGTON MUSEUM.

mitted, with a provision of £6,034 19s. 8d. for contingencies, amounts to £420,000, or £70,000 in excess of the grant. It will be thus seen that the total cost of the asylum will amount only to about £210 a bed, or with cost of land and equipment to £252 a bed, which we think a satisfactory sum when compared with other recently constructed asylums. For instance, we are informed that the new West Somerset Asylum has cost £377 a bed, including land and equipment, and the contract price for the building alone of the new North Staffordshire Asylum, exclusive of farm and other out-buildings, electric lighting and architect's commission, was £280 per bed. Other instances are the new Lincolnshire Asylum and the Hill End Asylum, St. Albans, which will, it is stated to us, be likely to cost £300 and £250 a bed respectively. The Council's asylum at Claybury cost some years ago, when building operations were less costly, £236 a bed, exclusive of land and equipment. Finally, we are of opinion that the Council will have in this building full value for the money expended, although the procedure adopted in fixing a definite sum for expenditure before a single plan was prepared has had its disadvantages." Mr. N. W. Hubbard, chairman of the Asylums Committee, explained the details of the excess, and held that the building would be well worth the expenditure.

**Amendments.** Mr. BEACHCROFT considered the recommendation, and moved as an amendment to it:—"That a special committee be appointed to inquire into the circumstances which have led the Asylums Committee to involve the Council in so large an expenditure for the provision of the Heath Asylum, Bexley." He explained that the foundations of the asylum were put in by the Works Department at a higher cost than that of the estimate. The committee were wrong, as the excess of £70,000 on the whole building could not have arisen from the increased cost of materials and labour. The committee said that improvements had been introduced, and extra works added; but these were not sanctioned by the Council, and, therefore, the standing orders were infringed. He thought the matter ought to be specially inquired into. The amendment was seconded by Mr. Westmacott, and opposed by Sir A. Arnold, as a vote of want of confidence in the Committee. It was suggested by Mr. Dickinson that after the money had been voted, the General Purposes Committee should look into the matter. On the division of the Council it was found that thirty-eight were for the amendment and sixty-eight were against it. Mr. Dickinson then moved to add to the recommendation a rider that the General Purposes Committee report upon the circumstances of the case. The recommendation of the Committee, with Mr. Dickinson's amendment, was agreed to.

**St. Paul's.** THE dome of St. Paul's Cathedral is gradually being made more pleasing to the eye and less garish than it was. Workmen have been busy undoing portions of Sir William Richmond's scheme of decoration. The red stencilling, with black letters over, on the stonework is being removed; certain of the small panels above the quarter domes have been made less obtrusive, by having their mosaic translated into a

quieter key of colour; and also a considerable number of the objectionable gilt bosses have been removed. We are informed that ever since the stencilling was begun there were grave doubts as to its suitability. It is very satisfactory to have these panels toned down, and to obtain only this concession would have fully justified the outcry raised. But there is still much that is unsatisfactory; the mosaic on the pillars should be entirely done away with, as it falsifies the appearance of strength and stability requisite for the support of the dome; the gilding on the mouldings in the choir should be removed. It can hardly be expected that the stained glass windows will be either removed, or replaced by others conceived with a notion of the art of working stained glass, but at any rate, let us hope that future ones will be entrusted to specialists in this line, and that they will admit more light than those of Sir William Richmond which are composed of such small pieces of glass. The glass windows in the dome should be left of clear glass, as they are at present.

### An Architectural Visit.

A PARTY of about twenty-five members of the Exeter Architectural and Archaeological Society took part in the annual summer excursion last Wednesday. The trip was arranged by the secretaries, Rev. R. M. Fulford and Mr. James Jerman. They made Newton Abbot their centre. The first old building visited was the typical Elizabethan mansion of Forde, about half a mile from the station, where the members were allowed to see the whole of the house, including the bedrooms occupied by Charles I. and William of Orange on his way to Exeter. The oak panelling, staircase, and beautiful plaster ceilings with pendants were much admired. The house was the seat and property of the Reynell family, and afterwards of the Earl of Devon. Leaving this, a lovely drive of about three miles brought the party to Hacombe, where the church of St. Blaize was inspected. The church has on plan a nave, chancel, and north aisle, south porch, and bell turret at the west end. There is an arcade of Transitional Norman work between the nave and north aisle, and many of the windows are of Early English date. There are many interesting monuments of Hacombes, Courtenays and Carews (the present owners). Close by is Hacombe House, the present residence of the owners, the Misses Carew. The house was rebuilt about 100 years since, judging by its style. From Hacombe the party drove to Wolborough, where they were shown over the church, dedicated to St. Mary the Virgin. The duty here was formerly provided for by the Abbots of Tor. There is a handsome screen stretching across the nave and aisle, though the groining has been removed, and some of the canopies which originally adorned the rich parapet of the rood loft have been fastened up against the front spandrels. On the north and south just outside the screen are two chantry chapels, around which the screens are carried. In the south porch is a recessed niche like a fireplace with a flue, probably used as a place to put "processional candles" in before entering the church. A similar one can be seen at East Ogwell. There are handsome tombs to the Reynell families.

### The Conclusion of the Visit.

THE next halting-place was at the interesting church of East Ogwell. It has nave, chancel, north aisle, south transept, and south of the chancel a chamber over the vault of the Reynell family, for the repair of which some land was given by the family in 1723. It was erected in 1650. The screen does not seem to be the original one, as it never had any groining, whereas the "newel" staircase to the rood-loft points to there being a groined screen at one time. The church was restored just as the present Archbishop was leaving Exeter for London and the present Bishop arrived, and the fact is commemorated by the heads of both being carved as terminals to a string underneath the sill of the east window. A short drive brought the members to

the rectory where tea was provided. Time prevented a visit being made to West Ogwell, so the next building visited was Lower Bradley. Here the perpendicular chapel with its "cradle" roof and the many quaint windows in the same style were examined, one little "oriel" being, as a member said, quite a "dream." A beautiful drive through the woods soon brought the party to Highweek Church. This church, dedicated to All Saints, stands on a lovely site to the north-west of Newton, and consists of nave, north and south aisle, and west tower; the tower arch is the oldest part of the church, dating from about 1200, and there is an interesting Perpendicular font with the arms of the Yardes, Ferrers, Bushell, and Bishop Lacey on the panels. The windows, south aisle, and west window of tower are of the Tudor style, inserted probably in the older walls. In the centre of nave roof is a large, richly carved "boss" with St. George and the Dragon on it. From this the party drove into Newton and returned to Exeter.

### Audley House, Salisbury.

THIS old house is of considerable interest, and contains some good carving and wood chimney-pieces. The premises have been adapted by Mr. Crickmay, to meet the needs of the clergy, and is now, we believe, a

but fortunately passed without causing loss of human life. Several minor casualties are reported. A workman was injured by a falling brick; a horse was killed by the collapse of a stable, and a fragment of masonry fell from a church, smashing four paving-stones and narrowly missing a passer-by. The Palazzo Sciarra and the Palazzo Chigi in the Corso were slightly damaged; a large stone fell from the Law Courts; several blocks of stone fell from the Colosseum; the columns in the Forum were seen to rock, but remained intact; a small fissure appeared in the recently-discovered Lapis Niger, but quickly closed again; and some unfinished jerry-built houses in an outlying quarter of the city collapsed. At Monte Compatri, half a church collapsed. The churches, being high buildings, suffered severely. At Monteporzio the cemetery and church were entirely destroyed. The marble coating of the façade of Marino Cathedral fell.

**London** THE annual report of the Works Committee of the School Board for London has just been issued, and deals with work done during the year ending March 25th. It shows that compulsory powers were obtained in the Session of 1897-98 over ten sites for new schools, and additional land for

church house for the diocese. Our illustration is from a sketch by Mr. Frederick Chatterton, who informs us that he cannot guarantee the spelling, as he obtained it from a neighbouring shopkeeper.

### Earthquake in Italy.

THE city and environs of Rome were visited last Wednesday by a severe shock of earthquake which damaged various edifices in Rome itself, and did considerable harm at Frascati, Rocca di Papa, and other towns on the Alban Hills,

thirteen existing schools. The number of sites for new schools scheduled in the present session is twenty-four, and the number of sites for enlarging schools or playgrounds or for general improvements is fifty. During the past year the Board have agreed to purchase several interests in sites, at a cost of £199,741, the surveyors' fees in connection therewith amounting to £1,382. The total cost of sites purchased up to the end of the year under review is £23,488,038, and the costs, £459,654. Nine additional schools have been opened

during the year, and thirteen enlargements were also opened. The cost of the new schools was £240,239, and the enlargements cost £95,767. With reference to the provision of accommodation in the future, tenders were accepted during the year for erecting ten new schools, giving accommodation for 9305 children, at a cost of £208,484. These schools will be situated one each in Chelsea, Finsbury, Hackney, Marylebone, and Tower Hamlets, two in Greenwich and three in East Lambeth. Tenders have also been accepted for erecting eleven enlargements, providing a total accommodation for 2,997 children, at a cost of £87,575. These enlargements will be carried out, one each in the City, Chelsea, Hackney, and Marylebone, two in Finsbury, two in Greenwich and three in Southwark. With regard to the new schools, it should be stated that the tenders include the provision of halls, which are not counted in the accommodation of the schools, the provision of centres for cookery, laundry, manual training or schools for special instruction, and also in all cases a drawing class-room. In three cases a playground is being provided on the roof; and three of the schools are being erected under special arrangements with a view to reducing the cost. As to the enlargements, the variations in cost arise mainly from the fact that in enlarging the buildings the opportunity is taken to improve the existing schools by providing halls, &c., so as to make them thoroughly efficient; and in some cases the tenders include centres for cookery, laundry, manual training, drawing class-room, a chemical laboratory, a new house for the school-keeper, and a new drainage system. Various other work was done in connection with the improvement of existing schools, and drainage and sanitary matters received especial attention. At Lady day last the following schools were in course of provision:—Sixteen schools, to accommodate 14,216 children, and twelve enlargements, to accommodate 3396 children, were being erected; thirty-five additional sites had been or were being purchased, the schools to be erected on twenty-eight of which would accommodate 21,759 children; six sites for new schools, accommodation not yet determined; and twenty enlargements of schools, to provide additional accommodation for 5,962 children. The educational department had also sanctioned the provision of sites in four districts, on two of which schools will be erected to accommodate 2,094 children. It will thus be seen that the Works Committee has not been idle during the past year.

#### Manchester Technical School.

DR. J. T. NICHOLSON, D.Sc., M.I.C.E., head of the mechanical and electrical departments of the Manchester Municipal School has presented to the Technical Instruction Committee an interesting report of his visit to some of the larger technical schools and engineering works in the Eastern States of America. Dr. Nicholson was much struck by the close practical bearing the technical schools generally have upon everyday engineering work, more especially in regard to their experimental departments; in all cases the professoriate were in the closest relation with practising engineers. The professors also have large influence with the employers of their district in securing positions for their students. "It is strongly believed," says Dr. Nicholson, "that this spirit of helpfulness on the part of the technical schools towards the manufacturers (which is so marked a feature in America and in Germany) would be of great assistance to the industrial development of England. Such helpfulness can be encouraged only by securing the confidence of manufacturers, and this can best be done by a close association between the school and their work, in order to find out what problems they are attacking, and how the experimental plant at the technical schools may be adapted to the study and solution of these problems for the benefit of the whole industrial system. When our engineers and manufacturers realise that we are in a position to construct apparatus and carry on researches on questions of immediate interest to them we shall be in a

position to justify our important relation to the industrial and commercial progress of the country." Dr. Nicholson believes that the experimental department of the Technical School is by far its most important side, and he asserts that the large expenditure and the increased area for laboratories now proposed for the Manchester School are by no means too great to correspond with the industries directly connected with the engineering profession which those laboratories will represent.

## Professional Practice.

**Edinburgh.**—The corner stone of a large new Episcopal church, in course of erection in Murieston Road, Dalry, was laid by Bishop Dowden recently. At present, only a portion of the church will be erected, the cost of this part of the structure being about £7,000. In its architecture the church follows the early French Gothic style, having an arrangement of nave, aisles, and sanctuary, with large hall, class-rooms, and vestries below. The extreme length of the portion of the nave at present being erected is 63ft. by 49ft. The sanctuary, which will be so constructed as to be easily altered when the church is completed, is 19ft. 6in. by 11ft. 6in. The seating area of the church will be for 500 persons. The large hall below will accommodate about the same number. The main entrance to the church will be approached by a broad flight of five freestone steps, over 30ft. in length—the church being entered by deeply recessed arched doorways, having enriched arched traceried windows grouped in on each side, divided by turreted buttresses. The doorway entering from Murieston Road, will also be of a very effective character. Another feature of the church will be the roof, which will be of open timber with a series of massively arched main spandril couples filled in with enriched arched tracery resting on clustered moulded pillars. The whole interior walls of nave and aisles are to be built of dressed warm-tinted freestone. The exterior walls are also to be finished with warm-tinted freestone dressings, and filled in with random rubble work to harmonise with same. The roofs are to be covered with green Westmoreland slates, and the windows filled with cathedral glass. The lighting throughout will be by electricity, and the heating by hot water small bore pipes. The architect is Mr. John Robertson, of Inverness.

**Hollinwood.**—The four memorial stones of the new Bethesda Particular Baptist Chapel were laid recently. The style of the new chapel will be Early English Gothic, and the front will be built of Halifax stone dressings and Hipperholme pierpoints. The entrance doorway is to be formed with moulded and deeply recessed jambs and arched with label mould and coping. Over the doorway will be a large rich traceried four-light window, with label mould and carved bosses. Flanking the doorway are to be mullioned windows with moulded transoms and heads, and over these will be minor ones with traceried heads, label moulds, and carved bosses. At the middle and sides will be buttresses panelled in upper parts with gablet stones and pinnacles and carved apex stones, the main coping being finished at apex with a carved ornament. In the entrance to the chapel will be a porch with panelled and moulded dado framing, and a vestibule framing and door of an ornamental character, which will be glazed with lead lights to upper portions. On each side of the vestibule will be separate cloak rooms for ladies and gentlemen. The principal lighting is to be obtained from the lower part of the roof, with lights glazed with ornamental glass, on account of the sides having to be built to extent of land and other property erected thereon. There will also be a gallery at each end of the chapel. The one in front will be for scholars, and the other at the back for choir and organ, each gallery to be approached by staircases. The back part of the premises will be occupied by minister's vestry, a

room for general purposes, and a smaller classroom, with a fireproof heating apparatus in cellar under same. All necessary lavatory accommodation will also be provided. The whole of the general internal woodwork will be selected pitch pine. The roofing will be of pine and red deal. The ceiling to roof will be semi-circular, with plaster cornices to eaves and side lights. In front of the pulpit will be the baptistry, enclosed within a moulded mahogany rail and ornamental standards. The seating accommodation, including galleries, will be for about 400 persons. The contractors for the work are Messrs. Squire Ashton and Sons, of Oldham, and the whole of the work is being carried out from the designs of Mr. David Taylor, of Hollinwood. The cost of the building, and other things in connection with the same, is estimated to be close on £2,000.

**Liverpool.**—The new General Post Office, which was opened by the Duke of York last Wednesday, stands on a site of nearly two acres. To Victoria Street the building has a frontage of 226ft., to Sir Thomas Street 254ft., and to Stanley Street 260ft. It is built of Portland stone, and was designed by Mr. Henry Tanner, F.R.I.B.A., architect to the Board of Works, who adopted the style of the Italian Renaissance. The front of the building is decorated with sixteen statues, four large figures representing England, Ireland, Scotland, and Wales, and ten smaller ones, Canada, Newfoundland, British Columbia, Barbados, West Indies, East Indies, Africa, Straits Settlements, New Zealand, and Australia; below are figures typical of commerce and industry, electricity and engineering. The site, with property facing Whitechapel, intended to provide for future extensions, cost £200,000, and the building and fittings £160,000. The height from the street level to the road is 83ft., and from basement to roof 96ft. The foundations are laid on a bed of solid concrete 2ft. thick, covering the whole site. The principal contractors were Messrs. Thornton and Sons, Liverpool. The building is of a very substantial character and fireproof, the floors, which are carried on steel girders, being of fireproof asphalt. The main entrance from Victoria Street gives access through a vestibule lined with marble, to the public office, 69ft. by 66ft., round three sides of which is a counter nearly 200ft. in length. On the same floor is the letter-sorting office, 244ft. by 64ft.; the parcels sorting-office, 220ft. by 64ft.; the foreign mail office, 74ft. by 61ft.; and the registered letter office, 67ft. by 22ft. The postmaster's entrance, also in Victoria Street, leads by a principal circular staircase to the first floor, on which are also situated the offices of the numerous departments concerned with accounts, district surveys, correspondence, public inquiries, missing and returned letters, as well as the postmaster's office, the office of the engineering staff, rooms for postmen, clerks, &c. The second floor is occupied by the telegraph and telephone services. The telegraph instrument room, with accommodation for 500 operators, has an area of 13,910 square feet, occupying the whole width of the building. The telephone room is 108ft. by 63ft. On this floor are a complete suite of dining-rooms, kitchens, cloakrooms, &c. On the top floor is situated the electrical storage apparatus. The basement is occupied by the electric and pneumatic machinery and storing accommodation. In the interior of the building, for the purposes of light and ventilation, is a courtyard, 174ft. by 102ft. At the rear is a spacious yard for the reception and delivery of mails. The yard is partially covered by glass roofing.

**Nottingham.**—A new county asylum is being erected near Radcliffe by the Notts. County Council. The complete area of the land is over 130 acres, and the main buildings are designed to cover some ten of these. The main entrance will be on the westerly boundary of the site, and the drive will communicate with the main buildings, which stand well in the middle of the expanse, due north and south. The centre of the block is to be utilised for the administrative depart-

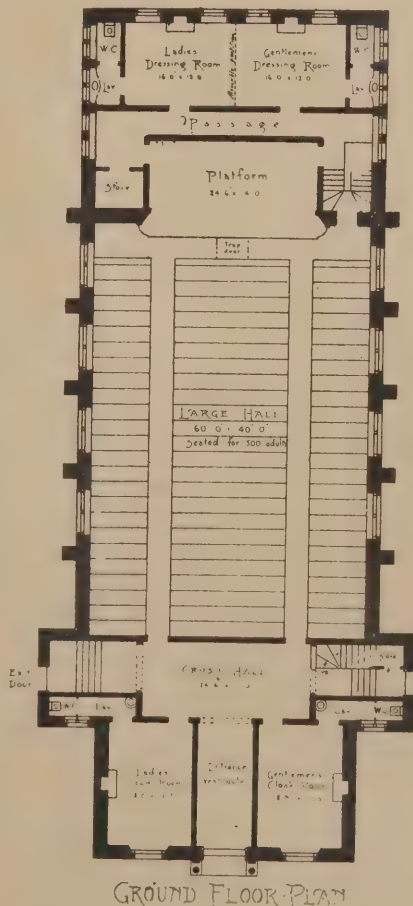

DESIGN FOR PUBLIC HALL, PITLOCHRY, N.B. EDWARD C. MAIDAN, ARCHITECT.

ment, consisting of a large recreation hall, which will have a stage measuring 47ft. by 20ft., and dining hall and servery and kitchen department to the south, with their numerous larders and stores, while on the north side of the kitchen court will be the general stores and outhouses. Ranged along each flank of the dining hall will be the apartments for male and female attendants, comprising mess-rooms, day and club rooms, and sleeping accommodation. The northernmost part will consist of the entrance block, which will jut out from the main building, and will contain the various offices, visiting rooms, &c. The patients' blocks will occupy a southern position, with that for males on the east side and for females on the west, both to be built on the echelon principle, and identical in size and arrangement. Accommodation will be provided for 225 patients in each, in addition to eighteen attendants, with separate wards for the sick and infirm, recent and acute, epileptics, and chronic; but should necessity occur the structure is so designed that additions could speedily be made which would bring the provision up to 600, the administrative blocks being already ample for that number. To the rear of the male quarters will be placed the workshops for the various craftsmen required on the premises, together with the boiler and engine houses and dynamo room, for the asylum is to have its own electric light installation. The mortuary, a small detached building, will also be situated on this side, also the laundry, which is to be equipped with all modern machinery, and a sewing room in the rear of the female department, adjoining a large court corresponding with that on the male side. Baths are to be provided on both sides of the asylum, and the whole of the departments will be connected by a covered corridor. North of the entrance block, on the opposite side of the drive, will be the chapel, to seat some 360 worshippers. It will have two entrance porches, organ chamber, vestry, and spacious chancel. The medical superintendent's house will be almost due west of this, with the isolation hospital stationed about 150 yards west of the main building. Spacious airing courts are to be provided for those patients who must be confined, but otherwise the premises will not be walled off. In close proximity to the entrance gates will be built a porter's lodge and houses for married attendants, while a little further to the north excellent farm buildings are to be erected, where it is eventually intended to accommodate some twenty working patients. The heating and ventilation are to be on the Plenum system, and will be carried out by Messrs. Ashwell and Nesbit, of London and Leicester. The foundations have been put in by Messrs. Fish and Sons, of Nottingham, and the superstructure, which is to be of plain

brick except so far as concerns the entrance block, the chapel, and the medical superintendent's house, which are to have stone dressings, faced with pressed bricks, has just been placed in the hands of Messrs. Pattinson and Sons, of Ruskington, Sleaford. The patients' wards will have wood dados with plaster above, and the sanitary annexes, kitchens, laundry, &c., are to be lined with tiles, glazed bricks, &c. The whole of the asylum will be practically on a dead level, and with the exception of the patients' and attendants' blocks, the buildings will be one storey in height. The plans have been designed, and the whole of the arrangements carried out by Messrs. E. P. Hooley (surveyor to the County Council) and J. Sander, engineer and architect. Mr. J. J. Bird is the clerk of works.

GROUND FLOOR PLAN

DESIGN FOR PUBLIC HALL, PITLOCHRY.

**Pitlochry, N.B.**—On this page we illustrate a design submitted by Mr. Edward C. H. Maidman, architect, of 13, Charlotte Street, Edinburgh, in a competition for a public hall to be erected at Pitlochry. Mr. Maidman's design shows a dignified design eminently suitable for the purpose it was intended. The ground plan shows a fine hall capable of seating 500 adults, with ladies' and gentlemen's cloak-rooms, lavatories, crush hall, and ladies' and gentlemen's dressing-rooms.

**Tomintoul.**—The Parish Church of Tomintoul is being entirely reconstructed from designs by Mr. John Robertson, architect, of Inverness. The whole of the interior of the building is to be gutted out, and the front walls taken down and rebuilt. The front of the building facing the roadway is designed with a series of arched Gothic windows, fitted in with mullions and arched tracery, between massive buttresses, having pinnaced buttresses on all angles. A new porch, the full height of the building, finished with buttresses to match those on the church, is placed next the roadway, forming the main entrance to the church. In the interior the ceilings will be all ground arched and pannelled with a series of dressed and varnished main arched couples, fitted in with tracery, resting on clustered moulded pillars. The church is also to be refloored with narrow dressed flooring. The body of the building is to be fitted up with massive and comfortable seating of varnished pitch pine, with moulded haggets and choir seats to match. The windows are to be fitted with stained glass, while the walls and ceilings are to be painted with soft, subdued church tints. The renovations are estimated to cost about £1,000.

#### Peterborough Cathedral Restoration.

—The completion of the restoration of the west front of Peterborough Cathedral was effected last week by the placing in position of the huge cross at the summit of the southern gable.

**The Wesleyan Chapel at New Hindley, Wigan,** the memorial stones of which have just been laid, is being erected at a cost of £6,000, by Messrs. Preston and Hirst, builders and contractors, of Wigan, from plans by Messrs. W. Waddington and Son, of Manchester.

**The Masonic Hall at St. Budeaux, Cornwall,** the memorial stones of which were laid recently, will be a one-storey erection. The front will be of dressed limestone. The retiring room will be in front, and the large room immediately behind. Mr. J. H. Nunn, of Plymouth, is the architect, and Mr. J. E. Carter is the builder.

## Trade and Craft.

### SANITARY FITTINGS.

Messrs. Oates and Green, Limited, of Halifax, have sent us their new catalogue of sanitary fittings for schools, public buildings, barracks, &c. It is extremely well printed on good paper, and is fully illustrated. Perhaps the most striking features of the catalogue are the pages containing illustrations of their plain glazed and moulded majolica bricks. The appearance of these bricks is excellently reproduced in colours. On pages six and seven the various shapes of glazed bricks are illustrated, and opposite each are given the prices of the different qualities of bricks. On page eighteen is a reproduction showing the arrangement of a patent automatic trough closet, with improved self-contained inlets, which prevent fouling. This closet is very suitable for factories, workshops, schools, and like places, and is made of heavy, highly-glazed nalcetric ware. Two pages further on is an illustration of their patent automatic flushing latrine. This is an isolated closet answering the purpose of a trough closet, but ensuring more privacy. Another patent automatic flushing latrine has the advantages of possessing a flushing rim and of being made in one piece of ware, thus avoiding any possibility of leaking joints. The catalogue gives the prices of these closets, as well as those of the lavatory basins, taps and tanks, closet seats, urinals, sinks, gullies and traps, channel bends, and other sanitary fittings supplied by the firm.

### KEY'S VENTILATION.

Messrs. Key and Tindall, ventilating and heating engineers, of Central Chambers, 109, Hope Street, Glasgow, have sent us a pamphlet dealing with Mr. William Key's system of ventilation. This system has now been before the public for some years, and has made a good deal of stir. The system consists first in impelling air upon an air-washing screen of cords, formed of horsehair and hemp, closely wound over a top rail of wood and under the bottom rail. There is a constant trickling of water down the screen, keeping it continually wet, and the air is filtered through it, all dust and soot particles being removed as they adhere to the wetted surfaces, the stream of water carrying them down into the drain. After passing the screen the air is warmed by contact with steam-heated coils, and then enters the living compartments by wide, shallow ducts, placed about 5ft. above the floor, where the incoming air is directed towards the ceiling and diffused. This incoming air drives out the air which has previously filled the compartment through openings at the floor level. Fog is completely removed by Mr. Key's system, and smut and dust are reduced. If a higher temperature is required in any particular room, secondary coils are introduced in the main air ducts to do this. Provision is made for tempering the incoming air by admitting filtered cold air with the warm, which is mixed while passing through the fan. Any given temperature can thus be maintained with ease. The whole air within the building is put under a slight pressure, so that it is claimed no air can enter except by the inlets provided for it, thus preventing any sewer gas from escaping into the building from faulty plumbing or soil pipes. The out-going air is taken by enclosed trunk flues to the roof ventilators, which are fitted with valve frames and valves in such a manner that in all weathers the air passes outwards uninterruptedly, even during gales. The air in any room may be renewed from six to eight or even ten times per hour as required. It is claimed that during summer the wet screen will condense any excess of moisture, and in winter, when the air is often too dry for easy respiration, the screen restores sufficient moisture to the air to give it a natural humidity.

### SEWAGE TREATMENT.

The Adams' Patent Sewage Lift Co., hydraulic engineers, and sanitary specialists, of Peasholme Green Works, York, are

now making special automatic apparatus for bacteria beds and sewage filtration. They send us a small pamphlet excellently got up upon the subject. Their automatic syphon for bacteria beds is controlled by the exit of air. On the expiration of any given interval of time they come automatically into work, discharging the contents of the filter bed, &c., in which they are placed. In this way the requisite intervals of work and rest required for bacteria beds are secured. The firm also supplies syphons which discharge alternately, distributing sewage to one of two filter beds, where two are used, or to one section of a series where a channel, &c., is used. We note a neat apparatus which allows of a free passage of sewage through it until the filter bed is full, when the supply is automatically cut off, regardless of the level of sewage in the filter bed. When the filter has discharged and stood for aeration, the apparatus is released automatically by the discharge of any connected bed; or, if by heat, the opening of an air cock. The apparatus has no complicated parts, the cut-off being effected by a valve. Any number of filter beds may be filled in this way, each shutting off as it fills. The firm also supply a patent adjustable wedge disc-valve for bacteria beds, &c. This valve, which has turned and ground faces, is adjustable in case of wear, and is well fitted for use in filter beds. A wedge on the handle causes the valve to lock at once tightly, and yet to open freely. The firm's speciality for upwards of fifteen years has been the manufacture of flushing apparatus, which has been brought to a state of great proficiency. Their syphons are made for every kind of work, drawing from 12in. upwards, and from 3in. to 36in. diameter of outgo, and are treated of in a neat little pamphlet. The company have also sent us another pamphlet dealing with their automatic sewage lifts. These sewage lifts automatically raise any liquid from a lower to a higher level by the air being compressed by a column of sewage or water. In effect, a sewage lift is an automatic engine, compressor, and pump combined, but requires only one moving part—a plain flat valve. Its use, where conditions are favourable, means the substitution of a self-acting lift, worked by waste liquid, entailing practically no annual expense for the costly engines and pumping plant usually employed. The firm desire us to state that they will send these pamphlets to anyone applying for them.

**New Technical Schools at Redditch** are shortly to be erected. The site in Easemore Road has been purchased, and the plans have been passed.

**The Norfolk and Norwich Archaeological Society** made a visit last week along the coast. The party started from Thorpe, and visited Cromer, East Runton, Beeston, Sheringham, Wayborne, and Felbrigg Hall.

**Memorial to Edmund Spenser.**—The Merchant Taylors' Company have decided to erect a stained-glass window in the great hall at the Merchant Taylors' School in memory of Edmund Spenser, who was educated at the school.

**The Birkett Memorial.**—Last Friday evening, Alderman Newton, the chairman of the Parks Committee of the Newcastle Corporation, inaugurated the new clock, which has been placed in the Armstrong Park in memory of the late Mr. James Birkett.

**The Como Exhibition.**—As we stated last week, this exhibition, destroyed by fire, is to be rebuilt. The construction of a new gallery has been decided upon, and Signor Linati, the architect, has already presented the plans for the new façade, which will be in Renaissance style.

**Clacton Cottage Hospital** was opened last Wednesday by the Lady Rayleigh. The building comprises two wards and a "paying patients" room, a central hall and nurses' rooms, with kitchens and other accommodation. The cost, including purchase of land and furnishing, will be £3,000.

## Keystones.

**Change of Address.**—Mr. Edgar G. C. Down, A.R.I.B.A., has moved into new premises at 31, High Street, Cardiff.

**Parkhurst Theatre, Holloway,** is to be pulled down, and a new one—to be called The Marlborough—erected on its site.

**New Nurses' Quarters for Norwich Hospital.**—The Earl of Leicester has sent to the Governors of the Norfolk and Norwich Hospital a cheque for £5,000, for the building of new nurses' quarters in connection with the hospital.

**The New Wing of Plymouth and Stonehouse Bethel,** the foundation of which was laid recently, is being built from plans by Messrs. H. J. Snell and M. A. Bazley. The building will consist of four storeys of brick and Portland stone.

**A Municipal Technical School for Leeds.**—The Finance Committee of the Leeds Corporation will shortly hold a conference with representatives of the various educational bodies in Leeds upon the subject of establishing a municipal technical school.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERTILLERY (Mon.).—For rebuilding the "Bell" inn, for Messrs. Phillips and Sons, Limited. Messrs. Swallow and Creighton, architects, Steam Packet Chambers, Dock-street, Newport. Quantities by architect:—  
David Lewis ... £1,260 0 | D. Jno. Davies ... £1,068 0  
W. Smith ... 1,192 5 | Jenkins and Son, ...  
Lawson and Co. ... 1,177 0 | Newport\* 948 0  
C. H. Reed ... 1,168 0 | \*Accepted.

BURTON-ON-TRENT.—For additions to Edge Hill House, Stapenhill, for Mr. John H. Radford, of Llandudno. Mr. Thomas Jenkins, architect, 35, High-street, Burton-on-Trent. Quantities by the architect:—  
J. T. Varlow ... £232 0 0 | W. Gee ... £275 2 6  
Henry Edwards ... 276 12 6 | George Kennard\* 272 12 7  
\*Accepted. Additional work at schedule of prices.

CHIPPENHAM (Wilts).—For technical and secondary schools for the Education Committee. Mr. Robert E. Brinkworth, F.S.I., of Chippenham, Wilts, architect:—  
William Bicozley ... £5,774 18 | Smith & Light, Chip-  
Downing & Rudman 4,877 0 | penham\* ... £4,310 0  
\*Accepted. Architect's estimate, £4,500.

LONDON.—For the brickwork and cast-iron sashes of superstructure of proposed new shops for Messrs. Yarrow and Co., Limited, at London-yard, Cubitt Town, E. Messrs. Bradshaw, Brown, and Co., architects, of Billiter-square-buildings, E.C.:—

T. H. Jackson ... £4,600 | Harris and Wardrop ... £4,027  
Dove Bros. ... 4,335 | G. Minter ... 3,697  
Mowlem and Co. ... 4,196 | Chafen and Newman\* 3,495  
Colls and Sons ... 4,169 | \*Accepted.

*2, Army and Navy Mansions, Victoria Street, London, S.W.*

CHEAP ROOF TRUSS FOR TEMPORARY PURPOSES. (DETAILS EXAGGERATED).

wall-plate. The rafters are 5in. by 2in., crossed and nailed together at the top, and spiked on top of the posts at the bottom. One tie of 3in. by 2in. is nailed on at such height as will give the necessary head-room. One purlin, 4in. by 3in., is set just over this tie. A piece of 3in. by 3in. is spiked on the top of the truss to form purlin and ridge-piece in one.

Over all a covering of boards, 6in. by 1in., grooved both sides, is laid with the slope of the roof, and nailed top, bottom, and centre,  $\frac{1}{2}$ in. spaces being left between each board. The upper end of one side is made to sail over 3in., to form protection at ridge as shown.

I built a shed in this manner three years ago for the purpose of brick drying, and have found it answer admirably, and it is, to all appearance, as substantial now as the day it was built. In this case I did not use a purlin midway up the roof, but in its place I strained a seven-ply galvanised fencing wire with stiffening struts at either end, to enable the end rafter to take the strain; and though this has answered fairly well, I do not recommend it in preference to the timber, as I find the grooved boards sometimes buckle upwards. I, therefore, consider a timber purlin to which the boards may be nailed is an advantage.

**Pembroke House Schools, Lytham,** have been fitted by Messrs. John King, Limited, engineers, of Liverpool, with their latest improved hot-water "steam tube" heating apparatus, with special economical coil heater with waterway fire-bars.

**Purchase of Waterworks at Godalming.**—After a prolonged discussion the Godalming Corporation have resolved to purchase the undertaking of the Frith Hill, Godalming and District Water Company, the estimated outlay involved being £72,250.

**Accident at James Bridge, Darlaston.**—An accident occurred last Wednesday at the James Bridge Iron and Steel Girder Works, James Bridge, Darlaston, belonging to Messrs. E. C. Keay, Limited, which resulted in the death of one man, and shocking injuries to two others. A workman named Thomas Powell, assisted by James Rosker, had to rivet a girder section, which was on the ground under a gantry on which a crane was running. Several rails, weighing about three tons, had been lashed together at one end of the gantry, and were being run along to the other end. As the crane approached where the men were at work, they were told to clear, but for some reason they neglected to do so, and a portion of the chain which lashed the rails together broke, and the rails becoming liberated, fell against a girder and afterwards on to the two men and a youth named James Clifford. When they were liberated it was found that Rosker was terribly crushed, and the other two were suffering from severe injuries. They were removed to a hospital, where Rosker died shortly after his admission.

## Engineering Notes.

**The Widening of Spencer Basin, Belfast,** at a cost of £31,000, has been decided upon by the Belfast Harbour Commissioners.

**Proposal to cut a Canal through a Mountain.**—G. A. Karwiese, the German engineering expert, who was consulting engineer in the construction of the Suez Canal, now proposes to build a still more remarkable ship canal across the isthmus between North and South America. His plan is to tunnel through a mountain range. By this plan full-rigged ships with masts reaching up to 180ft. high could sail right through the mountain range four abreast. The proposed canal would be eleven miles long, one and two-third miles of which would be the tunnel through the mountain. He claims that such a canal could be built in two years at a cost of 48,000,000 dollars.

**Large Engineering Scheme in Cumberland.**—About ten years ago nearly £200,000 was spent at the Hodbarrow iron mines on the building of a sea wall to keep the sea out of the workings of the mine. It is now proposed to go further seawards on a more ambitious scheme. The new wall will be in the form of an embankment with a puddled trench, and with rough squares of concrete tumbled down the bank as a breakwater for the sea. This new embankment will be 6,750 yards long, and will enclose 170 acres of land, under which the new extension of the mine will be worked. Ore has been proved to exist in vast deposits under this area, and although the cost of the proposed scheme will probably be from £400,000 to £500,000, it is well worth the enterprise, as Hodbarrow ore is the best hematite in England. There is no sign of the exhaustion of the mine, and it is believed that it extends well under the estuary of the Duddon.

**The Death of Mr. Henry Maudslay, M.I.C.E.,** occurred last week. He was a partner in the well-known firm of Maudslay, Sons and Field. During his life he carried out some important excavations in Jerusalem at his own expense. He also rendered much assistance to and frequently received the thanks of the Palestine Exploration Fund. A large portion of the paving which he discovered in Jerusalem was presented by him to St. Paul's Cathedral, another portion being placed in Freemasons' Hall. Mr. Maudslay was a very old and active Freemason, and appropriately was a member of a working engineer lodge, the Vitruvian, No. 87, which for many years met in Lambeth, and was largely composed of "Maudslay's men."

## Surveying and Sanitary Notes.

**The Widening of Cheyne Walk, Chelsea.**—At a meeting of the London County Council last week it was agreed, on the recommendation of the Improvements Committee, that the estimate of £4,400 submitted by the Finance Committee be approved, and that the Council should contribute, on the usual conditions, one-half the nett cost of widening Cheyne Walk, as shown by red colour upon the plan submitted by the Vestry of Chelsea, provided the contribution did not exceed the sum of £4,400.

**L.C.C. Loan and Alterations.**—At the periodical meeting of the London County Council last week, it was decided, on the recommendation of the Finance Committee, to lend the Lewisham District Board £700 for paving works. The same committee recommended, and it was agreed, that the estimate amounting to £1,450 for alterations at the Central Works be approved, and that an expenditure of a sum not exceeding that amount be authorised in regard to alterations in connection with the fixing of additional machinery at the Central Works. The work is to be carried out by the Works Department.

**Street Improvements at Gainsborough.**—Mr. Robert H. Bicknell, M.Inst.C.E., Local Government Board inspector, conducted an inquiry last Wednesday at Gainsborough into an application by the Urban Council to borrow £4,500 for purposes of street reconstruction, and also into an application for leave to deviate from a scheme of street improvement already sanctioned and for which loans amounting to £1,450 had been granted, so as to permit of a new road through Threadgold's yard instead of through Barnaby's Yard. Eventually the inspector said the loan would be granted subject to a satisfactory report that the underground services in each street were examined before the surfaces were reconstructed. The inspector agreed that Threadgold's yard was the better place for a new street, and then viewed the streets under discussion.

**Mr. Lewis Angell,** who for thirty-two years has held the position of borough engineer and surveyor to the West Ham Corporation, was called upon last week by the Town Council to resign, and has been offered a quarter's salary in lieu of notice. The report containing the recommendation was brought up by seven members who had been appointed to consider the reorganisation of the engineer's department. Although no reason for the dismissal was given in the report, it was stated that the committee thought the time had arrived when a younger man should be appointed. The debate in the council was of the most noisy character, and at times members almost came to blows. Alderman Kidd appealed to the committee to reconsider their decision, as Mr. Angell's services were imperative in the coming great sewage dispute with the London County Council. After several disorderly scenes, the recommendation of the committee was carried, with the addition that Mr. Angell be appointed consulting engineer without salary, but that he shall be paid adequate remuneration for any services he may be called upon to perform in connection with work in hand and in the sewage dispute with the London County Council. Notice has been given to rescind the resolutions.

**Improvements at Leicester.**—On Wednesday morning last an inquiry was held at the Leicester Town Hall by Mr. W. O. E. Meade-King, M.I.C.E., on behalf of the Local Government Board, with reference to the applications of the Town Council for the Board's sanction to the borrowing of £31,926 for street improvement purposes, and £2,600 for laying out the Western Park. Mr. Tin-

dall and Mr. Staines conducted the inquiry. —Mr. Tindall explained that the first set of proposals had reference to the purchase of several properties in the High Street for the widening of that thoroughfare, and he mentioned the buildings it was necessary to acquire. The next item was in reference to the purchase of a warehouse and shop in High Street and Cart's Lane, from Messrs. Staines, at the price of £16,975, exclusive of any compensation for disturbance, which would be settled by arbitration. The total ground area was 643 yards, of which 564 square yards would be available for resale. The last item dealt with the purchase from Messrs. Bonner of the premises, No. 50, High Street, for the sum of £2,024. Mr. Tindall added that these purchases completed the widening of High Street on the south side, between Cart's Lane and Highcross Street, but there still remained a small portion to be acquired on the north side. —Mr. Staines stated the case with respect to the loan of £2,600 required for the laying out of the Western Park. The works comprised the construction of an entrance, a roadway through the park, alterations of fences, a band stand, &c. A portion of the work had already been carried out, and the park was opened to the public a few days ago.

## Masters and Men.

**Newcastle Joiners returned to work** last Monday, the masters having decided to give the advance of  $\frac{1}{2}$ d. per hour demanded.

**Dalkeith Plumbers**, at a meeting held last week, resolved to demand an additional half-penny per hour on the present wages scale.

**Masons at Waterville, Ireland**, working on the new works which are being erected at the Commercial Cable Company's station, struck work last week for an advance of 6d. per day on their wages, which are at present 5s. 6d. per day.

**Strike at Gibraltar.**—The men working on the dockyard extension struck last week because water for drinking was refused. When they were paid the same day, one half day's pay was deducted from their wages. They now claim an increase of wages. On the other hand, it is rumoured that the contractors intend reducing the actual wages and making the workmen pay for the water they consume for drinking. Five hundred men are on strike.

**Building Trade Dispute.**—The past week has been very quiet. Since the settlement between the Yorkshire Federation of Building Trade Employers and the London Order of Bricklayers, the National Association of Master Builders have decided to meet the Associated Trade Unions to discuss any questions that may be raised by either party to the conference. If these matters are satisfactorily disposed of, then the Federated Employers will be ready to consider the scheme formulated by the Trade Unions for the establishment of a Joint Conciliation Board, with an ultimate reference of disputed questions to independent referees. The joint conference will take place at the Salisbury Hotel, Fleet Street, E.C., tomorrow, and will be taken part in by twelve representatives from each side.

**The Halifax Joiners' Strike.**—In the Chancery Division of the High Court of Justice, recently, the case of Charnock v. Court, which we reported in our issues of April 12th and April 19th last, came before Mr. Justice Stirling. Counsel for the plaintiff said he was instructed to move, pursuant to special leave given by the Court for the purpose (1) that the action, which had already been ordered to be tried at the Assizes at Leeds during the present month, be transferred to the Queen's Bench Division for that purpose, and that it be tried by the learned judge with a special jury; and (2) for directions as to costs of an application for an

affidavit of documents, which was before his Lordship on July 5, when the costs were reserved pending the filing of an affidavit by the defendants. The application was refused; as to that part of it relating to the affidavit of documents, the judge made no order, except that the costs should be the costs in the action.

**The Federated Trades Unions.**—The first meeting of the National Council of this newly-formed Federation was held at the Westminster Palace Hotel last Wednesday. Mr. W. J. Davis, chairman of the Parliamentary Committee of the Trades Union Congress occupied the chair at the opening of the proceedings. There were 44 unions, with a united membership of nearly 350,000, represented. Mr. S. Woods, M.P., secretary *pro tem.*, submitted a report as to the constitution of the Federation, and the following officials were appointed:—President: Mr. Pete Curran, Gasworkers; vice-president: Mr. Allen Gee, West Riding Textile Workers; secretary: Mr. J. Mitchell, Engineers; treasurer: Mr. J. Maddison, Ironfounders. It was decided to hold an adjourned meeting of the Council at Birmingham in January, when the place for the annual meeting in the following August will be decided. The Council fixed on London for the headquarters, the voting being—London, 162,000, Manchester, 142,000.

**Accident at Christ Church, Birmingham.**—His Honour Judge Whitehorse, sitting at the Birmingham County Court on July 5th, was asked to fix the amount to be paid to one of the workmen who was injured by the falling of the Christ Church roof on February 7th, 1899, an account of which appeared in our issue of February 15th. Applicant, who made his application under the Workmen's Compensation Act, was George Hood, described as a clerk of works and a workman, of 66, Birchall Street, and the respondent was James Benton, builder, of Great Barr Street, who trades as Benton and Son. Mr. Stubbins was for the applicant, and Mr. Ellison was for the respondent. Mr. Duffell represented the Life and Health Assurance Company, who were before the court as third parties. Applicant, who was earning 30s. a week, was on the floor of the church when the beams gave way, and was pinned to the ground by the fallen timber. He sustained a compound fracture of the left thigh, and a comminuted fracture of the left forearm, besides flesh wounds and bruises, causing him to become an in-patient of the General Hospital for two months and since then an out-patient. —Mr. White, the house surgeon, who attended the injured man at the hospital, told the Court that up to a fortnight ago Hood was totally incapable of working. He was now able to do light clerical work, but would never be as strong as he was before the accident. His Honour, in reply to the suggestion by Mr. Ellison that any sum his Honour awarded should be divided—one portion for the time the man was totally incapacitated, and the other portion to be the allowance after that date, which should be something less,—said he was not in a position to assent to an aggregate sum; applicant must leave himself in the hands of the Court. Applicant, recalled, stated that he had a wife, but no children, though he had an adopted daughter to support. His Honour awarded the applicant 15s. a week compensation up to June 20th (less fourteen days after the accident), and 10s. a week for life after June 20th. —Mr. Ellison applied for an order that the Assurance Company should not be entitled in any further proceedings to dispute the validity of the award. —Mr. Duffell pointed out that the company repudiated any liability. —His Honour acceded to Mr. Ellison's application.

**A Dependency Case.**—In the First Division of the Edinburgh Court of Session, last week, before the Lord President and Lords Adam and Kinnear, the case of Robert Murdoch v. Patrick Fagan was stated by Sheriff-Substitute Strachan in an arbitration brought before him, in which he was asked to find the respondent, Patrick Fagan, labourer, of 45, Adelphi Street, Glasgow, entitled to a sum of

£200 under the Workmen's Compensation Act in respect of the death of his son John Fagan, who was fatally injured on January 11th last, while in the employment of the appellant, Robert Murdoch, builder, of 91, Maxwell Road, Glasgow. The respondent averred that he was entirely dependent for support on his son, against whom he had obtained a decree for aliment at the rate of 2s. per week. The deceased John Fagan was survived by a widow, who received compensation from the appellant for the death of her husband. The widow was wholly dependent on the deceased, and the appellant understood that she was the only person entitled to compensation in respect of John Fagan's death. The Sheriff-Substitute held that the respondent was partially dependent on his son, and awarded him £25 compensation. The questions in the case were: (1) Whether the fact that the respondent held a decree for aliment against the deceased and received payment of aliment from him constituted the respondent a part dependent within the meaning of the Act; and (2) whether the fact that the deceased left a dependent wholly dependent on him, excludes the claim of the respondent as a part dependent on the deceased. The Court answered the second question in the affirmative, and found the appellant entitled to expenses. The Lord President said that in his opinion no one who was partially dependent on the deceased could claim compensation under the Act of 1897 if a person existed who was wholly dependent on the deceased. He could not say that was perfectly clear, or at least so clear as might be expected, one way or another, on a point of this importance. But it seemed to be the necessary result of the part of the Act relating to this subject. After summing up the provisions of the Act he answered the second question in the affirmative, and that superseded the first question, which was not debated. Their Lordships concurred.

**Amalgamated Society of Engineers excluded from the Trade Union Congress.**—A very curious situation has arisen in connection with the Trade Union Congress, which is to be held at Plymouth in September next. The Parliamentary Committee of the congress has informed the Amalgamated Society of Engineers that it will not be allowed to send delegates on account of its attitude towards the Co-operative Smiths Society. This means that the 84,000 members of the A.S.E. will, for the first time in its history, be excluded from representation at the Trade Union Congress. It seems that on April 5th, 1898, the Co-operative Smiths, a small society on the Tyne, had a dispute with the firm of Mail, McFarlane and Co., of Newcastle, with reference to the employment of a lad who, they complained, was "put to the fire" at the age of twenty years. Because of this, two members of the Co-operative Smiths struck as a protest. Their places were taken by two members of the A.S.E. The Smiths appealed to the Federation of Unions engaged in the shipbuilding trades, and that body advised them to take advantage of the 20th Standing Order of the Trade Union Congress, which says: "Any society engaged in a dispute, and considering themselves aggrieved by reason of the members of another society taking the place of the men on strike, may report the circumstance to the Parliamentary Committee, who may then take such steps as the circumstances may warrant, and should the charge be proved, the offending society shall be charged with all costs and suspended from representation at congress for two years." The Parliamentary Committee appointed some of its members to inquire into the matter, and these gentlemen, having gone into the charges, expressed the opinion that the A.S.E. took the right and proper course, but they recommended them to withdraw their members from Messrs. Mail, McFarlane and Co.'s works. This the Council of the A.S.E. refused to do, and the Parliamentary Committee, last Thursday, instructed Mr. Woods to inform Mr. Barnes that the A.S.E. would not be allowed to send delegates to the Plymouth Congress, in consequence of their infraction of the Standing Order 20.

Builders' Notes.

**The Aston Union Cottage Homes**, near Birmingham, are being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues and patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**The Contracts for Dundee Parish Council Offices**, which were accepted at a meeting of the Offices Committee of the Dundee Parish Council last week, were tendered by the following, being in each case the lowest: Mason work, Mr. Robert Laing; joiner, Messrs. Garvie and Farquharson; slater, Messrs. Alexander and Thomson; plumber, Messrs. William Mitchell and Son; plasterer, Messrs. Kirk and Coutts. The total amounts to £5,557.

**Glasgow's Municipal Enterprise.**—A site was recently acquired on the eastern outskirts of the city for the erection of new gasworks. On the site a large deposit of clay suitable for making bricks has been discovered. A committee of the Corporation recommend that plant, at a cost of £8,000, be erected for the utilisation of the clay. Not only will the bricks necessary for the gasworks be made, but it is estimated that a large profit will be derived from the sale of the surplus.

**Builder Fined for Keeping a Carriage.**—At the Nuneaton Police-court last Thursday John Simpson, contractor and builder, of Nuneaton, was summoned by Hubert Alexander, Inland Revenue officer, for keeping and using a carriage at Nuneaton on June 4th without a licence. He pleaded not guilty, and said the vehicle was one which he used primarily to convey his men to and from jobs some distance out. He did not let it out on hire. Hundreds of builders did the same. Defendant was fined 5s. and 11s. 6d. costs.

**Accident to Painters at a Lancashire Theatre.**—At the Theatre Royal, Ashton-under-Lyne, last week, an accident occurred to three men, employed by Messrs. Binns, of Halifax, while painting and decorating the interior. The men's names are John Midgley, H. Fletcher and James Riley. It appears that they were at work on the ceiling on scaffolding supported by stepladders which had been erected in the gallery. One of the stepladders suddenly gave way, with the result that the three men fell—Fletcher and Midgley into the upper circle, and Riley on to the gallery edge. Riley was seriously injured, and had to be conveyed to the infirmary.

Midgley and Fletcher were removed to an adjoining hotel, being not seriously injured.

**Arbitration Case at Hathersage.**—Mr. Edward M. Gibbs, architect, of Sheffield, published his award last week in an arbitration heard by him as umpire on June 5th and 6th. The case aroused considerable interest in Hathersage and the adjoining neighbourhood. Mr. Ambrose Melland, builder, of Hathersage, claimed that there was a substantial amount due to him from Mrs. E. A. Whitworth, wife of Mr. F. H. Whitworth, of Hathersage and Sheffield, over and above his contract price for the erection of two villas for Mrs. Whitworth on the Castleton Road. Mrs. Whitworth's case was that she had paid Mr. Melland all he was entitled to; and that he was liable to her for certain work which she alleged was unfinished. The umpire has ordered Mrs. Whitworth to pay Mr. Melland the sum of £169 within three weeks, and also to pay Mr. Melland's costs as between solicitor and client, and finds that there is nothing due to her from Mr. Melland.

**Scottish Building Trades' Federation.**—The quarterly meeting of the Executive of this Federation was held on Tuesday, last week, at the Caledonian Hotel, Inverness. Representatives were present from Glasgow, Edinburgh, Dundee, Aberdeen, and other Southern centres. The chair was occupied by the President, Mr. James Leslie, builder, of Aberdeen. The report of the Secretary, Mr. James L. Selkirk, C.A., of Glasgow, on the operations of the Federation during the quarter was submitted, and considered at considerable length. The discussion was of a thoroughly practical kind, and resolutions were arrived at that will lead to a more complete consolidation of the Federation in all parts of the country. In the afternoon the members visited the battlefield of Culloden. In the evening a meeting took place under the chairmanship of Treasurer Ross, President of the Inverness Branch, when addresses were delivered by the delegates dwelling upon the importance of organisation as desiderated by the Federation. Among the speakers were Mr. Leslie, of Aberdeen; Mr. Robert Lamb, of Edinburgh; Mr. Adam, of Glasgow; Mr. Shaw, of Dundee; and Mr. Selkirk, of Glasgow, Secretary of the Federation; and others.

**Fatal Accident Inquiry at Arbroath.**—An inquiry was held in Arbroath Sheriff Court last Wednesday by Sheriff-Substitute Lee into the death of Edward Docherty, jun., who resided at Ladyloan, Arbroath, and was a labourer in the employment of Messrs. J. Paterson and Son, Ltd., contractors, of 610, Pollokshaws Road, Glasgow. From the evidence of workmen it appeared that deceased,

who was employed on the surface of the Arbroath Waterworks extension, had received instructions to send a quantity of bricks and other building materials down the shaft, which is 60ft. deep. It seems that Docherty thought the cage had returned to the top, and fell down the shaft with a hutch and the building material. A juryman asked whether there should not be some definite system of signalling to be observed when the cage was at the bottom of the shaft. The sheriff remarked that acting on the assumption that the place was dangerous he would prefer, instead of any indication which might lead him astray, to look whether the cage was at the top of the shaft before stepping into it. A formal verdict was brought in finding that Docherty was accidentally killed on July 3rd, 1899, by falling down a shaft at the Warslay new waterworks, Arbroath.

**Builders and Contractors at Plymouth.**—The conference of the National Association of Contractors and Master Builders of Great Britain and Ireland was opened last Wednesday at Plymouth. The delegates, numbering between 300 and 400, were welcomed by the Mayor, Mr. J. Pethick, himself a well-known builder. A meeting of the council followed. The half-yearly meeting of the association was held in the afternoon, Alderman W. Holdsworth, of Bradford, presiding. The chairman, in an introductory address, referred to the dispute between the master builders and the plasterers. He regretted that some of the terms of settlement had not been observed by the plasterers, and announced that on the 26th inst. it was proposed to hold another conference with the plasterers with a view of adjusting differences and disputes arising over the interpretation of some of the terms of the previous conference. The principal topic of discussion was the builders' relation with the plasterers, and representatives from Manchester and Bristol complained strongly of the attitude of the latter towards the builders and their neglect to abide by the conditions of the conference terms. The Manchester representatives declared that the plasterers had demanded a rise of a penny in their wages as compensation for the lock-out, and the result was that members of the association refusing this demand had been boycotted for a long time past. It was said that unless the plasterers in these and other districts showed a different spirit from that which was at present being shown a general lock-out would soon be brought about. It was agreed to make a special point of the difficulties at Manchester and Bristol at the forthcoming conference. The association appointed twelve delegates to attend the general conference of trades' unions to be held to-morrow.

**YOUNG ARCHITECT, A.R.I.B.A.**, ASSISTS in the PREPARATION OF DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W.

**QUANTITIES prepared**, specifications written, works measured, and variations adjusted by reliable London Surveyor. Over twenty years' experience. Special terms by arrangement.—"Surveyor," office of the BUILDERS' JOURNAL. 23

**PLUMBER, GAS, HOT-WATER FITTER** wants SITUATION: good references; seven years in city firm.—"E. M.," 55, Rehere-street, Goswell-road, E.C. 1

**GENERAL FOREMAN** wants a Job, Carpenter and Joiner. General knowledge of all branches, well up in structural alteration, public-house work; town or country. Good references.—"J. B.," 66, Acre-road, Kingston-on-Thames. 1

**ABLE ASSISTANCE.** WORKING and DETAIL DRAWINGS, DESIGNS, PERSPECTIVES, TRACINGS, QUANTITIES and SPECIFICATIONS, DIFFICULTIES of PRACTICE advised upon. F. BRENT, 34, Great James-street, W.C. 50

**ARCHITECT**, having spare time, is willing to undertake preparation of Working Drawings, Tracings or Perspectives. Terms moderate.—Roberts, 19, Lynton-road, Kilburn. 1

**DRAUGHTSMAN** seeks ENGAGEMENT. Seven years' London and provincial experience. Well up in horticultural work and hot water engineering.—Address R. H. C., 5, Elm Bank Gardens, Barnes, S.W. 2

**ADVERTISER** desires SITUATION as ASSISTANT CLERK of WORKS or Builder's Foreman; first-class certificates in carpentry and joinery, building construction, architecture, &c.; accurate plan-taker; over twenty years' experience in high-class woodwork.—Address "J. W.," No. 51, Caledonian-road, Leeds. 3

**ARCHITECT'S GENERAL ASSISTANT** with nine years' experience, at present managing an old-established provincial business, wishes to fill an APPOINTMENT in London as General or Second Assistant. Age twenty-five. Plans, specifications, quantities, surveying, levelling, delapidations, and general office routine. Had practical training and experience with municipal architects and engineers. London Managing or Second Assistant requiring provincial appointment, an exchange might be arranged.—Apply, Box 1140, "BUILDERS' JOURNAL" Office. 3

## An Architectural Causerie.

### An Architect's High Calling.

It is a commonplace amongst architects to say that none should enter the ranks of their profession unless possessed of special aptitude, and that those who are unpossessed of it and yet strive to enter drift almost of necessity into surveying and building. And thus it is in reality an accepted axiom, though men rarely put it in those words, that architecture is more than a mere business or profession—a calling of high order, which only the comparatively few have been given the necessary talents to follow with success. Granted that the talent exists, training may do much to aid in its development; but the power of designing with excellence of harmony buildings which are to stand for centuries to come as monuments of the genius of the present generation is one which no amount of training will develop if it has not been implanted in the nature of a man at his birth. On the other hand, if its presence be recognised its exercise becomes imperative, the possession of the talent, as of any talent, carrying with it the responsibility for its employment, and this in no niggardly spirit, but to the utmost extent that circumstances will permit. We accept this freely as regards the musician, the painter and the sculptor, yet the architect's work is more lasting than that of any of these, appealing to as high emotions, mutely but surely influencing, for good or evil, during decade after decade and century after century. We admit it freely of the medical practitioner, yet the architect's work, properly carried out, conduces to the health of the community to a greater extent than does the doctor's. We admit it, too, of the minister of religion; yet the architect's calling is not far behind even his in its nobility and its responsibilities. When dealing with secular buildings even, it is the architect's bounden duty to teach of honesty, of purity, of the everyday virtues of domestic and business life; but when dealing with buildings intended for the higher purposes of religion, his responsibilities become great indeed. Worship, glory and honour—the elevation of the spirit of the created in praise to the Creator—all have to be symbolised; the young and the old, the joyous and the sorrowing, all have to be helped. Whether he be designing a simple country church, or a great cathedral, the nature of the work demands the exercise of the architect's fullest powers, that he may render back with interest to Him who gave it the talent committed to his care. Before undertaking work of so high a character, so lasting, and so full of influence, the talent should have been developed

by unremitted training through many years, that when called upon to exercise it the architect should be found worthy of his high calling.

G. A. T. M.

### Commercial Architecture.

THAT a purely utilitarian building can, by the application of certain principles in art, be made satisfactory and pleasant to the eye; that a single material, simple design, and severe outline can produce a total effect which is generally good and often excellent—these are things which the public are loth to believe, yet eminently true. Forty years ago the rebuilding of "The City"—the old red or brown brick Palladian city which had arisen after the Great Fire—was commenced, and a fine commercial quarter arose, of which Cornhill may be taken

generally thought. A considerable number may be seen from the bridges or from a river steamer, modest structures in brick, plainly indicating their purpose by the large doors on every floor and cranes for hoisting or lowering materials, but relieved by a simple cornice and a few mouldings, the main lines of the building running vertically upward in brick, and having the effect of pilasters. Rising above wharves and steamers and tan-sailed barges, their architectural effect is admirable; they illustrate the power of simplicity and truthfulness. Some, indeed, are ugly, but in these cases we can always detect some want of proportion, some palpable mistake in design or the introduction of some misplaced ornament; in many cases they have been spoilt by huge tawdry lettering for advertising purposes, but take it for all-in-all, Thames-side can show some good specimens of simple commercial architecture. A little-known thoroughfare to most people is Southwark

DOORWAY AT LAVENHAM CHURCH, SUFFOLK. DRAWN BY PHILIP J. TURNER. (See p. 383.)

as a type, streets resembling those of Genoa with houses largely modelled upon the palaces of Italy, and, like them, often of rich and ornate material, the outward expression of the wealth of London, but restrained as a rule by the limits of proportion and fitness. These buildings were commercial in the sense conventionally attributed to the word in London; they were banks, offices of insurance companies, exchanges, and large private firms. But there is another kind of commercial architecture, more literally utilitarian, that of the warehouse and the factory, of the great buildings that line our docks and wharves and streets, which though busy are almost as little known to the average city man as they are to the clubman of the West End. Of these London contains more examples carefully worked out than is

Street, which was cut thirty years and more ago right through a maze of small dingy streets between the Surrey end of Blackfriars Bridge and the Borough, near London Bridge. It is a purely commercial street and intended from the first to be so, wide and well-proportioned; unattractive as being without shops or amenities of any kind but useful as showing that utilitarian structures are not necessarily ugly. It is specially worthy of note that many of the fronts are Lombard or Gothic, the small round arch of the former lending itself perfectly to modern purposes and especially to street fronts; the pointed arch of the latter is here evidently drawn from the same source—that is from northern Italy. Still more effective designs might have been possible however if our modern Acts of Parliament did not so systematically discourage all bold projections and thus prevent any striking effects of light and shade.

J. C. P.

## On Reflection.

### The New War Office Buildings.

A MEMORIAL has been circulated among the members of the House of Lords, at the apparent instigation of Lord Wemyss, and extensively signed, petitioning the Government to have the architect's design for the War Office buildings supplanted by an adaptation of Inigo Jones' design for Whitehall Palace—"which it is believed," says the memorial, "might without difficulty be made to meet all War Office requirements." It is possible that Lord Wemyss may have investigated the matter, and that he holds this belief, but it is incredible that the other signatories can have satisfied themselves of the plausibility of the suggestions made in the memorial. The action of the noble lord is not complimentary to the capable architect whose design is thus all at a discount; but it is questionable whether his reputation is so much concerned as the fame of the great seventeenth century architect. It is a distinct slight to the memory of Inigo Jones that a group of persons who have advertised their ignorance of the essentials of Architecture, as these memorialists have done, should declare an admiration for his design. We may imagine the poor shade wringing its shadowy hands and exclaiming after Johnson, but with a very different relish: "Have I then done something that *they* can understand!"

### An Opportunity that will be Missed.

A RECENT correspondent to the *Morning Post*, who preserves his anonymity by signing himself "Piccadilly," made a well-considered suggestion which we hope will be adequately presented before the proper authorities, and at least receive the consideration it undoubtedly merits. "The official position occupied by the Royal Institute of British Architects," says the writer in question, "entitles it to possess sufficient accommodation to display adequately the works of its aspirants to architectural fame when occasion requires," and he suggests that the Government, on the completion of the proposed removal of the London University to quarters at South Kensington, should instal the R.I.B.A. at Burlington House. Although the reasons the writer gives for his recommendation are precisely the wrong ones, and are destitute of any persuasiveness, the idea is useful and apt. It is useful and apt because it reminds people that a wider recognition is due to Architecture, and because it constitutes a plausible illustration of what would be conceded if Architecture held in England a proper place among the recognised arts. For all direct and practical purposes the idea is barren and useless. A brief for the Home for Lost Dogs, in a similar claim, would promise better than one for architecture in the present condition of culture in England. But by every means let this suggestion be urged with all possible conviction and gravity. It is impossible; but impossible things become possible and easy by dint of time and tenacity of purpose in much asking; and perhaps the next tenants of Burlington House may retire one day in favour of Architecture.

A GREAT deal has been spoken of late, Latest Intelligence! mainly by prejudiced or irresponsible people

it is true, of the decay of the building crafts; but for a final revelation of the dark and deadly fate which pursues those who adopt the habits of independence and easy self-indulgence, which characterise the modern artisan, we have to thank Mr. John Burns, M.P. The world's moralists have ever been frantically concerned to persuade a reluctant people that a too great moral latitude in matters of conscience and ideals, must, in any condition of life, call forth a corresponding physical degeneracy and incompleteness in the back-sliders; and in the case of the building trades, it would seem that Nemesis has claimed her own with awful precision and swiftness. Mr. John Burns' revelation is the more worthy of credence for being accidental, as will appear, and for being innocent of prejudice. There is no intimation that Mr. Burns has been building himself a house, for instance, or testing a drain. It came, about, then, that a party of excursionists from Stoke visited London and included the House of Commons in their round of sightseeing. Mr. John Burns saw them on his way to the House, covered them with an observant eye, and described them in the interests of his side of the debate to urge further legislation for the protection of those employed in the pottery trade. He said that with the exception of a contingent of bushmen from the wilds of Timbuctoo, he never saw a body of more miserably diminutive people. He said that on every face there were marks of suffering and bad conditions. He said they had heads like sugar loaves and shoulders like champagne bottles. According to the "*Staffordshire Sentinel*," however, which ought to know, the subjects of Mr. Burns' compassionate eloquence were not "potters" as he supposed, but members of a building trade picnic.

### An Architectural Side Show.

NOT the least of the wonders which may be looked for by visitors to the Paris Exhibition next year is a perfect house. A group of French architects and artists in various of the crafts and fine arts, propose to erect in the exhibition grounds a "*type de maison moderne*," which shall combine all the highest excellencies of science and art to which civilisation has recourse in procuring beauty and convenience for a dwelling-house. It is hard to imagine a more illusionary and will-of-the-wisp enterprise than this of building a perfect house. The perfect house is no more and no less than that house which, being soundly constructed, perfectly expresses the tastes, and fulfils the needs of those it is designed to accommodate. No house can therefore assume to any degree of perfection, save from the point of view of a very limited number of persons; and we are surely agreed that the house which satisfies the general tastes and necessities of the largest number of persons, must be very far from perfection, for it must disregard just that individual character which associates it with its human inmates, and which constitutes the essence of a well-designed house. Indeed, we all know the average house, and the more we know of it the wider it departs from our idea of perfection in a house. It stands in long ranks side by side with itself, in streets that are called "avenues," or "crescents," or "terraces," but never "streets." It is known as a "desirable semi-detached villa," and generally has a bay window and shares the name of a bloody battle or a great general

with its twin. A fish store—even a cow house—may be dealt with in generic terms, but a house never. All that the French architects may look to achieve in their enterprise will be to erect a house which shall fulfil hygienic conditions as now best understood, and shall have a plan which offers all convenience, without hindrances, to the modern type of man, who all the world over now springs up of mornings and scrambles to catch a train, flapping a newspaper. They may also decorate it upon sound principles of appropriateness and elegance, but it can hardly be hoped that such a temptation to produce something garish and ambitious of notoriety will be resisted. A large paying public would be disappointed else. Indeed, the whole project smacks somewhat of that gate-money foresight which has characterised many exhibitions of latter years. Nevertheless, the little building will be a curiosity to all, and instructive to many. Most people who see it will surely go and look inside it, and all who examine it will come away with a distinct idea of some things that are imperfections in a house. A negative virtuousness truly, but something not to be unthankful for in these philistine days.

## OUR NEW VOLUME.

Next week's number of *THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD* will commence a new volume, and will afford an admirable opportunity for new readers to begin subscribing to the Journal. With the beginning of the present volume the Journal was permanently enlarged, and a number of improvements were introduced, which, judging from the expressions of opinion that reach us from time to time, have been very generally approved.

The new volume which begins next week will prove even more attractive, we believe, than the current one has been.

Among other important and interesting articles that have been arranged for may be mentioned the following:—

### MODEL QUESTIONS AND ANSWERS

A series of questions actually set at recent examinations in architecture, surveying, and building construction, with model answers by G. A. T. Middleton and R. W. Carden, Associates R.I.B.A. These should prove invaluable to students, as the answers will in all cases be worked out from a practical point of view, the conditions and limitations of an examination being taken into consideration.

### FORTHCOMING COMPETITIONS

Notes on competitions that have been announced, and the conditions that govern them. These should prove useful to all who take any interest in architectural competitions. We shall continue as heretofore to publish from time to time criticisms on competitions that have taken place.

### WITH GREEK BUILDERS. BY JOHN A. MARSHALL.

This will be a series of well illustrated articles, explaining the constructive principles which governed the erection of the architectural masterpieces of ancient Greece.

### MOSAIC WORK. BY GEORGE BRIDGE.

In these articles both the artistic and the constructive sides of the craft will be treated in a comprehensive and thoroughly practical manner.

### NEW PATENTS.

A column devoted to brief abstracts of New Patents, specially prepared for *THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD*, is a new feature that will be introduced with the next number, and will no doubt prove generally useful.

SKETCH PLAN OF WOOLPIT CHURCH. DRAWN BY PHILIP J. TURNER.

## NOTES ON SOME SUFFOLK CHURCHES.

By PHILIP J. TURNER.

Stone Bench End at Woolpit Church.

**WOOLPIT CHURCH**, about eight miles from Bury St. Edmunds, is a decorated building with numerous Perpendicular additions, of which the south porch is the most important. It is a beautiful and elaborate design, richly groined with a parvise over it and fine open parapet. The interior, however, is deserving of the most attention. A lofty clerestory added during the Perpendicular period is spanned by a splendid double hammer-beam roof of the most costly description. The wall pieces are wrought into niches filled with figures of saints, supported by angels with expanded wings. The aisle roofs are of the same date as those over the nave, and equally rich in detail; happily, in this instance, they have all been well restored and appear now in good preservation. The seats are very perfect and beautiful, and are panelled and carved on the backs as well as the ends; the rood screen also is an excellent specimen of Perpendicular work, though somewhat mutilated. The easternmost window in the south aisle is lowered to form the sedilia, and an elegant piscina is cut out of the angles of the jamb, which is supported by a small shaft. The masonry of the church is composed of stone dressings with flints laid in random courses. The tower was struck by lightning about twenty years ago, and a new one has been built on the old site.

**ELMSWELL CHURCH**, which adjoins the parish of Woolpit, stands on the ridge of a high hill, and is principally Perpendicular in style. The tower is a grand example of the well-known

Suffolk flint work. The sacred monograms, Maltese crosses, catherine wheels, pots of lilies, and other devices which are worked on the buttresses, and round the base are executed with much grace and freedom. The church was extensively "restored" in 1872, and it was then that the old roofs and some of the screens were removed, so that the church appears to have lost much of the interest it originally had. In the south aisle is a chantry with a piscina and a very good Perpendicular carved oak screen. Against the east wall of this chantry is erected a very fine Renaissance monument to Sir Robert Gardiner, who died in 1619, and who was during the reign of James I. Chief Justice of Ireland. The Knight is represented life size, reclining under a canopy, with the costume and face coloured.

The font is a very good and interesting example of the Decorated style, octagonal on plan, and is supported on four figures of angels, the basin being panelled with shields, five of which are charged with the letters H E D G E consecutively, which form probably the name of the donor. There are some interesting oak benches in the aisles, typical of those with which the county abounds. These are of rather earlier date than those at Woolpit. Two of the poppyheads are here illustrated; they are somewhat different in shape from those at Woolpit, and are evidently of earlier date.

**LAVENHAM.**—Of all the fine churches to be found in Suffolk, that at Lavenham, dedicated to St. Peter and Paul, is generally considered to be the best.

With the exception of some decorated work in the chancel and vestry the whole church is a splendid design in the Late Perpendicular style, and was built between the years 1480 and 1530 (contemporary with King's College Chapel at Cambridge) by the De Veres, Earls of Oxford, and members of the Spring family, whose arms are dispersed in flint and stone-work all over the building. At the time the church was being built, Lavenham was a most

prosperous place, being the centre of the woollen industry, and it is on that account, no doubt, that so many fine churches are found just in this district.

The church is constructed of Free stone with very curious decorations of flint work. The east end between the altar rails is the oldest part of the building, and almost the only remaining part of the earlier church. The junction of the old and new work is very evident. The fine chancel arch and piers are also in the decorated period, and also the east window, which is an excellent example with fine flowing tracery (five-light). In the chancel are some fine old stalls with misereres.

Attached to the east end of the chancel is a vestry built by Thomas Spring the second, the date of which is recorded on a brass to his memory 1470-1486. On either side of the chancel are chapels, that on the south side is 35ft. 3in. by 20ft. 5in. wide. The roof of this chapel is very good; the cornice composed of foliage and shields bearing the arms and initials of Thomas Spring.

The woodwork throughout the church is singularly fine, and it is impossible to speak too highly of it, both as regards design, variety of detail, and the great merit of the workmanship.

The rood screen is of oak, and is the earliest woodwork in the church. In the north aisle is a chantry chapel (marked A on plan) enclosed with screen work of the most exquisite details. It is a rare specimen of the semi-classic style

LAVENHAM CHURCH, SUFFOLK: SKETCH OF TOWER. BY PHILIP J. TURNER.

which came into fashion in the reign of Henry VIII., and is probably the work of Flemish workmen. This chapel is supposed to have been erected about 1530.

The nave measures 91ft. 6in. by 25ft. 9in., and is divided into six bays of very beautiful proportions. The capitals of the pier shafts are finished with a delicate Tudor flower, and the spandrels of the arches are filled with good panelling, above a rich cornice and a band of quatrefoils in lozenges and blank shields alternately. The roof of the nave was formerly painted. The clerestory has large three-light windows with transoms. The higher lights still contain traces of stained glass. The south porch is very rich in architectural and heraldic ornamentation. The front and buttresses are panelled, the decoration being quatrefoil and trefoil shaped flowers, similar to those repeated on the battlements.

The great feature of Lavenham Church is its unrivalled tower, 141ft. high and 42ft. wide. The interior of the tower is decorated with an arcade, beneath which runs a stone bench. A newel staircase with a good door, and handrail cut out of the solid masonry leads to the belfry

SKETCH PLAN OF LAVENHAM CHURCH. DRAWN BY PHILIP J. TURNER.

which boasts of a peal of eight bells second to none in the county. The large western doorway (illustrated on p. 381) has a segmental pointed arch, the soffit of which is richly panelled with quatrefoils. On the exterior the doorway is deeply recessed; it has an ogee dripstone beautifully crocketed, which passing through the string course appears again on the upper side, and was originally terminated by a finial. The mouldings are somewhat poor, and the bases are exceedingly stilted. The tower buttresses are richly panelled the whole way up, and all have shields bearing arms.

Round the base of the tower is a rich panelled band in compartments, which are ornamented with foil work of splendid and varied detail. The tower appears to have been left in an uncompleted state, and now ends in a parapet having panels with coarsely executed shields bearing the arms of the Spring family. The parapet to the nave is a pierced battlement with openings partly filled up with a large conventional leaf, perhaps a Tudor flower, rising upwards, the intermediate spaces enriched with boldly carved foliage in square panels. The coping is continuous. The length of the church is 156ft., the width 68ft.

COCKFIELD CHURCH, which is about three miles from Lavenham, although not so well known as the latter, is full of interest, and is principally of the Decorated style, with Perpendicular additions. The details throughout are very good, especially the chancel, with its richly moulded string courses, plinths, &c., and the groined niches in the buttresses, all in the pure late Decorated style. The Tower is 71ft. high, and of good proportion. There is an octagonal staircase on the south side, which is not placed at either of the angles, but near the middle.

It is noticeable that the clerestory windows are not over the centres of the arches, but over the centre of the piers, and also that there is an additional window on each side, in the space nearest to the chancel arch. The east window is large, but the tracery has been restored. Against the north wall in the chancel is a fine altar tomb (illustrated on page 386) of late fourteenth century, panelled, and with shields; over it is a canopy of fine design, divided into three bays, and by

buttresses with rich pinnacles. There is a great variety of detail about this monument, but it is somewhat disfigured by whitewash. To whom this monument was erected is unknown; an ancient manuscript says it is erected to a knight named Howard. The matrices of the escutcheons are now coloured black. The tomb itself is of Purbeck marble, while the canopy is a soft limestone. The pulpit is a typical Jacobean specimen. There are a few good oak stalls in the chancel.

The roofs of the nave and aisles are simple in construction, but show an unusual amount of finish as regards mouldings, carvings, and applied colour. The nave roof is of pure Decorated date, of a good pitch, each principal truss being formed of a tie-beam, with king post above, from which spring curved braces, two being in connection with the longitudinal ridge under the collar beams, and the other two abutting against the upper strutted rafters, which help to make up the general polygonal form of the roof. The nave piers are octagons, with moulded caps. The tower buttresses are square, two of which, next the nave, project somewhat awkwardly on each side of the first nave piers. The font is a plain octagon.

**A New Baptist Sunday School at Cullingworth** has been erected at a cost of £1,650. The building has a seating capacity for between 500 and 600 persons.

**The International Art Exhibition.**—The promoters of the International Art Exhibition gave an entertainment last Wednesday evening in the galleries in aid of their new Art movement. A scene from "Beauty's Awakening," the masque recently performed by members of the Art Workers' Guild at the Guildhall, was enacted, the scene being that of the "Dance of the Forest Leaves." The music accompanying the dance was performed on ancient instruments, played chiefly by the Dolmetsch family. After this a concert of old English music was given on ancient instruments by the Dolmetsch family. Another concert and entertainment was given in the outer gallery, where distinguished musicians, actors, and actresses entertained a large audience.

ELMSWELL CHURCH, SUFFOLK: SKETCH OF BENCH END. MEASURED AND DRAWN BY PHILIP J. TURNER.

## ROYAL ARCHÆOLOGICAL ASSOCIATION.

### RESTORATION AS A DESTRUCTIVE ART.

THE meetings for the year 1899 of the Royal Archaeological Institute of Great Britain and Ireland, were opened last Tuesday week at the Town Hall, Ipswich. At the outset, the chair was taken by the town clerk, Mr. Will Bantoft, in the absence of the mayor, Mr. E. P. Ridley. The company then visited places of interest in the town. The first place visited was Christchurch Mansion, of which an interesting description was given by Mr. J. S. Corder, who acted as guide to the party. St. Margaret's Church was next visited. The ancient house, in the Butter Market, was the next place of meeting. The Rev. J. T. Micklethwaite drew particular attention to the mouldings, and it was suggested by Sir Henry Howorth that these were a union of Italian and English; but Mr. Micklethwaite thought they were purely English. Through Wolsey's Gate, the company were admitted to the lawn in front of Mr. J. T. Rainer's residence, and here Miss Nina Layard read a valuable paper, giving the results of recent researches with regard to the great Cardinal's project in his native town, and the limits of St. Peter's Priory. At St. Peter's Church, Mr. V. B. Redstone read a few notes on some old wills. Mr. Micklethwaite showed many evidences that this was an old church of the fourteenth century, that had been restored and added to, but not pulled down and re-built, and he described the font as one of about 800 years old, and similar to others, wrought in Belgium, which are to be found at Winchester and Southampton. St. Mary Key was also visited, with other objects of interest in the locality.

In the evening the opening meeting of the Historical and Antiquarian Section was held at the Town Hall, under the presidency of Sir W. Brampton Gurdon, K.C.M.G., M.P. Sir Brampton Gurdon's discourse was on "Restoration as a Destructive Art." It had been very justly said by one of the most distinguished members of the County Archaeological Society that the modern restorer was a far more dangerous person than Dowsing, because Dowsing's work was only partial, whereas the restorer aimed at being thorough—that was, at destroying every vestige of architectural beauty and historical interest. They all agreed that a copy of an antique statue, or a picture by an old master was not so valuable as the original, and that a restored statue or

COCKFIELD CHURCH, SUFFOLK. MEASURED AND DRAWN BY PHILIP J. TURNER.

picture was reduced in value by the process, but they did not all seem to recognise that the same held good of an architectural building. In mediæval times the artists carried out the work themselves. Now we had only designers or modellers, and workmen carried out their directions with mathematical exactitude, with square, line, and compass. It was the difference between a beautiful, flowing hand, expressive of every word that it wrote, and a copy by a lawyer's clerk, or, worse still, a type-writer. He felt that, much as we might regret some of the mutilations which occurred during the Commonwealth, probably a good many of the pictures and ornaments swept away by Dowsing were only tawdry, and objectionable in other ways; and he (the speaker) could not help hoping often that some modern Dowsing might arise who would destroy some of the interpolations introduced by the so-called "Restorer." No doubt, anyone who wished to earn a crown of martyrdom would deserve most highly of posterity if he were to go round the churches of this country with a pocket full of stones, and destroy nine-tenths of the coloured windows, the tasteless designs, the crude greens and blues of modern glass,—the product of the half-century now drawing to a close—much of which was literally only painted. It was not only the bad glass that was objectionable, he urged, but its introduction into buildings where it was altogether out of place. He supposed they were all agreed that what was called "cathedral glass" was an abomination. It might be the saving, he contended, of many interesting and beautiful relics of the past if bishops would instruct their examining chaplains to set papers in Architecture as well as theology. What they wanted was to make generally known the simple rules of art and good taste—the ignorance and vulgarity of the present day were appalling. A very abominable practice of the modern restorer was stencilling. Of the cheap, nasty styles of so-called decoration this was the nastiest. It was not suitable for church decoration. In Hadleigh the whole chancel had lately been stencilled in such a way that it exactly resembled the farthing a yard paper which they saw in cottage bedrooms. There was another point where, in his opinion, the church decoration failed, and that was in the terrible sameness of the church furniture—the same benches were reproduced in almost the same form in every village church. It was really quite a relief now-a-days to find oneself in an old-fashioned "churchwarden" building, with a three-

ELMSWELL CHURCH, SUFFOLK: POPPY HEADS IN SOUTH AISLE. DRAWN BY PHILIP J. TURNER.

decker, high pews, and a gallery. He did not pretend to admire the style, but it was at least a change from the everlasting pitch-pine seats, and he wished that some of these churches could be preserved as specimens of their period. There was, until recently, a fine example at Orford—the regular old Corporation pew, the gallery advancing well into the nave. At Coddensham there were, not long ago, exceedingly beautiful carved oak pews; but they had all been swept away, and replaced by the worst abomination of all—chairs. There was an exception in one corner, where Lord de Saumarez, with a patriotic instinct which did him infinite credit, refused to allow his own seats to be removed, and they remained an isolated evidence of the beautiful work once to be seen there, and which was now in all probability adorning the house of someone who had the discrimination to buy it. The "restoration," as distinct from the preservation of screens, seemed to be another mistake. The attempt

to restore in cases where they were not even certain what had been destroyed was generally, if not always, a failure. Norfolk and Suffolk were peculiarly rich in fine buildings, both ecclesiastical and domestic, and it was their duty to use their best efforts to preserve them, not only by arresting decay, but by stopping the ruthless work of the so-called "Restorer." It was a matter of great regret that so many beautiful old halls were being gradually allowed to fall into decay, or were spoilt by the introduction of bow windows and other horrors. Why people of independent income did not try to purchase these exceedingly comfortable, well-built houses, instead of erecting for themselves ugly, jerry-built, and very uncomfortable cockney villas, he had never been able to understand.

Sir Brampton Gurdon then concluded his remarks by stating that what he specially wished to press on the meeting was:

1. The study of architecture. To try and induce others to take the same interest in architecture that they did themselves; it was so engrossing and attractive a study that it could hardly fail to interest if once taken up. Perhaps it might be taught in secondary schools.

2. To take the greatest care of their monuments and they would not want to restore them. A few timely repairs to the roof, a few sticks and leaves cleared from the water-courses, might save both roof and walls from ruin. Above all, a sharp watch should be kept at Easter, Christmas, and Harvest-time, when the entrance of nails and hammers into the Church should be forbidden. A really fine bit of carving should never be broken off, because it got in the way of a sprig of holly.

3. That when reparations were necessary, new stones might be substituted for decayed ones, when they were absolutely essential to the safety of the fabric; portions likely to give way might be propped with wood or metal; sculptures ready to detach themselves might be bound or cemented into their places. But no modern or imitation sculpture should be mingled with ancient work; and no attempt should ever be made to repair or restore carving, painting, or stained glass.

4. It often happened that those who wished to preserve some ancient part of the church felt, that their want of archaeological knowledge disqualified them from opposing the more fully informed architect. They should not let themselves be overawed by learning which in reality did not affect the question. It needed no special training to understand whether the architect's plans aimed at preservation or alteration. It was a simple question of fact, and what had to be decided was, "Shall the old

WOOLPIT CHURCH, SUFFOLK: POPPY HEADS IN NAVE. DRAWN BY PHILIP J. TURNER.

church be maintained, or shall we have an archaeological exercise by the architect?"

5. To avoid varnished pine, cathedral glass, and encaustic tiles. In his own church at Assington, some barbarian has covered up the gravestones of his ancestors, which he knew, from the inscriptions of the monuments, must be lying below, the most hideously vulgar, garish encaustic tiles above. It was a great grief to him, and he knew not when public opinion would allow him to tear up the floor of the chancel.

The most precious heirlooms were the ecclesiastical buildings scattered about the country. Many well-meaning (he might say, excellent) clergymen have an idea that they were wanting in reverence when they discouraged attempts to restore these old buildings to their supposed original plan, and to embellish them with ornament of the style in vogue at the particular period to which it was aimed to bring them back. The venerableness, charm of originality, distinction as a work of art, must be lost in their reproduction, however ingeniously carried out, while many links with the past, and associations with the simple faith and earnest lives of our forefathers, were also swept away.

A vote of thanks to the president was then carried by acclamation. Miss Nina Layard then read a paper on "The Religious Houses of Ipswich."

On the Wednesday the members visited Grundisburgh Church, St. Mary's Church at Woodbridge, Seckford Hall, Playford Church, and Tuddenham Church. In the evening Mr.

G. E. Fox, M.A., F.S.A., the director of the Silchester Roman excavations, read a paper on "Roman Suffolk."

On Thursday the members visited Halesworth, Southwold Church, Wenham Church, and Bramfield Church. On the same day a conversazione, organised by the Suffolk Institute of Archaeology and Natural History and the Ipswich Scientific Society, took place in the Ipswich Museum and Art Gallery. Here the fine collection of illustrations of stained glass in Suffolk, and painted screens, made by Mr. Hamlet Watling and Miss Layard's collection of Mr. Hamlet Watling's copies of stained glass, screens, frescoes, &c. were much admired. Mr. Woolnough exhibited lantern slides of old Ipswich, with descriptive comments, and Mr. St. John Hope lectured on "The Maces of Orford, Ipswich, and Beccles."

On Friday the annual business meeting of the Institute was held at the Town Hall, at which it was decided to hold the next annual gathering at Dublin. An excursion was afterwards paid to Framlingham and the neighbourhood. In the evening, at the Town Hall, the architectural section of the Institute was opened by the Very Rev. R. M. Blakiston, F.S.A., who made some remarks of a general character upon the subject of church restoration. In a church of the Early Decorated period, for instance, upon close observation, it might be found that there were traces, more or less marked, of work of later days. The correct restorer would at once say these were modern additions, and, therefore, ought to be done away with, and the church restored to

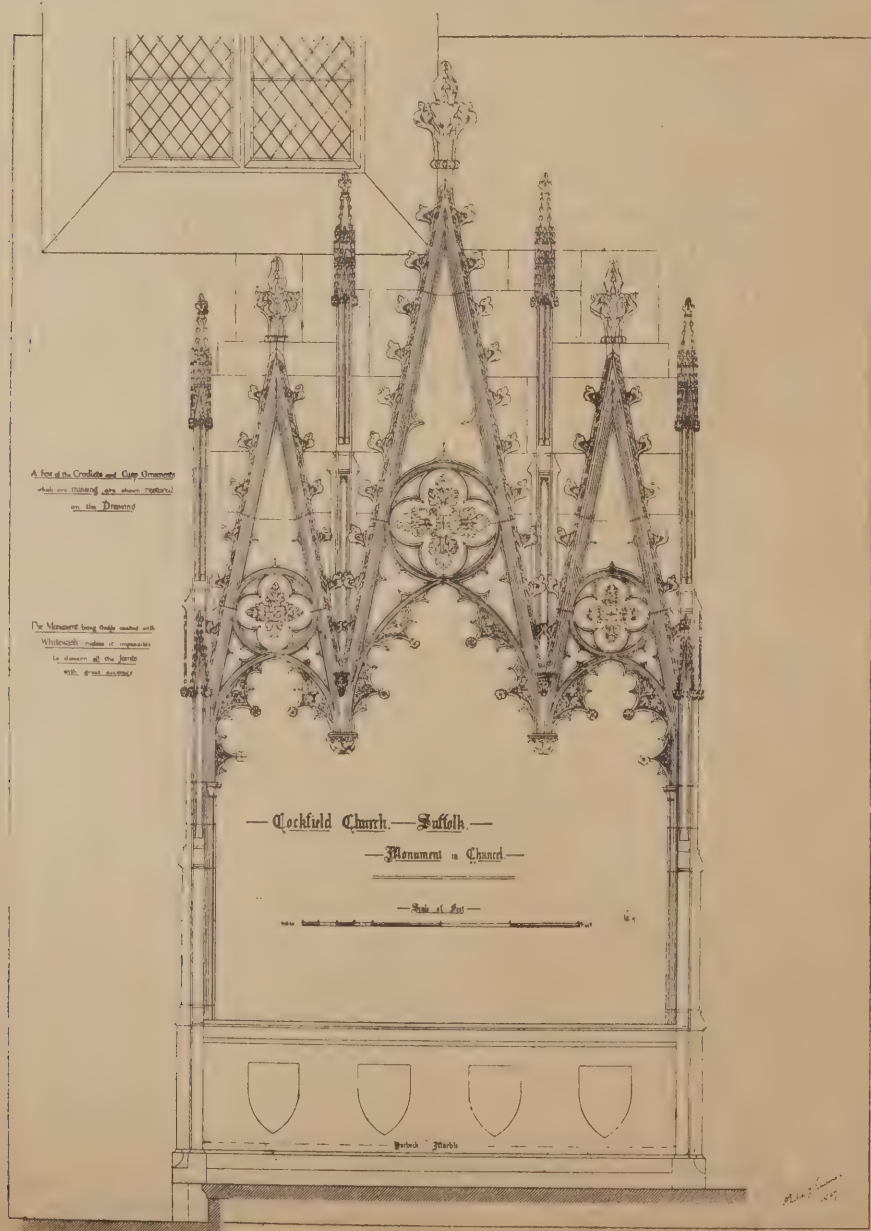

SKETCHED BY PHILIP J. TURNER.

the exact state in which it first took shape in the Decorated period. This kind of treatment struck him as falsification of history. A person would say: "Our old church is not large enough for the needs of the parish, and a separate additional church is not needed. What is to be done? May we not touch the ancient fabric at all?" He, the speaker, would reply without hesitation: "You must first of all meet the needs of the parish; therefore, if necessity demands it, your old church must be enlarged." But, in doing so, the greatest care should be used to interfere as little as possible with existing work. Except in a few very rare cases, where there was a priceless relic of early times which it would be a sin to destroy, it might generally be managed that the additional work could be added without very serious meddling with old work; and, indeed, if the old work must be altered, the needed addition would but be an extra step in the ladder of the church's history. Before concluding he should like to touch delicately on one matter, which, as a Churchman, he could not altogether pass by. In many of the thousands of sets of drawings for the so-called "restoration" of English parish churches that he had seen, there had evidently been a great lack of knowledge of what was the real use of a church. It was on this ground that he always thought that the person who was selected for the work of repairing an old, or building a new church should be himself an earnest Churchman. His conceptions of what a church was for must necessarily differ from those of a person of another persuasion, who could not possibly share the Churchman's views of what was necessary for the purposes of Divine worship.

Mr. Micklethwaite, in the discussion which followed the paper, thought that from the excesses and absurdities of so-called church "restoration," there was the danger now of a reactionary swing of the pendulum. The tendency was to maintain the church as a museum, but the fact ought to be realised that, although the churches of England were historical monuments, they were still living monuments, and should be regarded in that light.—Mr. V. B. Redstone then read a most exhaustive paper on "Orford Castle."

#### Summonses against the Crystal Palace Company.

At Penge Petty Sessions on Tuesday last week arguments were heard on four summonses taken out by the London County Council against the Crystal Palace Company in respect of certain stables for polo ponies which the Company had erected, and which the County Council said were in contravention of the London Building Act, 1894, which constituted the Council the supervising authority over all buildings in the County of London. Mr. Horace Avory appeared for the County Council, and Mr. Cunningham Glen, for the Crystal Palace Company, who maintained that the buildings complained of did not come under the provisions of the Act. The Bench reserved judgment.

## SCULPTURE IN RELATION TO ARCHITECTURE.\*

BY T. DUNCAN RHIND.

(Concluded from page 369, No. CCXXXIII.)

NOW let us make a few comparisons between the way memorials are designed and carried out in France and the method adopted in Britain. Some years ago in a recent competition for a public monument in Edinburgh to Scotland's national heroes, Wallace and Bruce, the Town Council in whom lay, and still lies, the power to give the commission had but the one idea, and that was their own—they had no advice from any artist; it was to place statues, 12ft. high, on one pedestal, under the impression, no doubt, that the bigger the statue the more imposing and grand the monument would be. Few sculptors competed, their reluctance to do so being due to the hard and fast rules that were to fetter them in the competition. It can be imagined what an unmeaning, stupid proposal it was to have these

which, symbolical though it be, there is not an intelligent Frenchman but will readily understand.

The committeemen we have amongst us can see nothing beyond what is already in so great profusion in our midst, and the sculptor is bound to go on multiplying and replenishing the city with the false bronze representations of our public men; false I say emphatically, for, excepting the head, few of our public statues are portraits in anything besides.

George Square in Glasgow holds, I think, more public statues than any similar space in the whole country; and it is noticeable how little attention they attract from the passers-by. The monuments, so monotonously conventional in their treatment, and so devoid of any decorative feeling, stand there evoking little more interest than the chimneys that render Glasgow more worthy of the name of Auld Reekie than our purer-aired city of the East. When it was determined to plant this square so lavishly with monuments, the authorities might have made infinitely more of such an opportunity of worthily em-

reverently of the men who had died for their country, and memorials for this same cause have brought out some of the finest sculpture that has ever been executed.

There is one memorial erected recently which somewhat approaches this idea, and that is Gilbert's statue of the Queen. The figure itself is most beautifully modelled, but it is the designing of the throne and the allegorical subjects that are remarkable. The shield work and wrought work feeling throughout is wonderful, and can only stand as another proof of the genius of Gilbert. Not only is his sculpture good, but all his architectural details are the same; there is a peculiarity—original, yet bold and dignified—that seems to imbue all his work, and his light and shade effects are always very strong and well placed.

In walking through the streets of Paris you cannot resist the feeling that the French are possessed of the idea that without sculpture no building of importance is complete. This same idea is powerfully expressed by one of our leading architects, who says that "Sculpture is the very soul and voice of architecture. Without it ancient buildings would not speak in the way they do. The separation of the soul from the body means death, and architecture, divorced from sculpture, is deprived of the light of the sun of intellectuality, and cannot rise to the ideal or suggest a higher life. If we wish the labours of our life to be of any real value, it cannot be arrived at while we create dead works."

In the meantime, however, sculpture, so far as Scotland is concerned, is decidedly in the shade, as it has been for a considerable period, while the support accorded by the public to painting has been largely and steadily increasing. This, as I said before, is, I think, owing in a great measure to the cultivation by the Academy and other exhibitions of a class of sculpture which appeals only to the already refined and the wealthy; and is by them buried in the seclusion of their houses with the result that it does little to bring forward that higher class of architectural figure sculpture which is such a powerful agency in beneficially influencing public taste in regard to our street architecture. According to the ideas prevalent in Edinburgh, it would just be a little beneath our leading sculptors to take up such works as sculptural decoration on the architectural basis, they would designate it "architectural sculpture," as implying something beneath the type of the sculptors' "pot-boiler," the bust. It is not therefore much to be wondered at that there are such a large number of public buildings in Edinburgh in their inanimate, silent condition.

One great thing we should always remember is that if the money that is often spent in covering a building with "shapwork," "swags," "masks," &c., which are very well in their way, were concentrated and spent in one or two groups or panels of really good sculpture, the effect I am bound to say would be infinitely better, as it is far safer to take off ornament than put it on.

And while we boast, and are proud to be able to boast, that there is a distinctly recognised and well-defined Scottish School of Painting, we must admit that in the field of sculpture Scotland has yet to win her spurs. These spurs she will never earn by such miserable doles of help and countenance as have been grudgingly accorded to sculpture in the past by her authoritative guides in the world of art. Individual talent and individual energy are indispensable factors in the success of any cause; but in the present "winter of our discontent" these struggle in vain to produce their legitimate flower and fruit; they want the sunshine of official recognition, and the breath of popular favour, to foster and make good a development which, once attained, will be on all hands acknowledged as a blessing and a boon.

**Consecration of a Chancel.**—The new chancel of St. Bartholomew's Church, Marsden, was recently consecrated by the Bishop of Wakefield. The church has been erected at a cost of £14,000, and the chancel alone will have cost about £4,000.

FROM THE BASE OF A STATUE ERECTED IN MEMORY OF GEN'RAL CHANZY AT LE MANS.  
BY CROISY.

two figures standing together—statues of men of whom we possess no portraits—yet what a splendid opportunity was here presented for an allegorical memorial—a combination of architecture and sculpture, where representations of the brave deeds of the heroes could have varied with symbolical sculptures, illustrative of their characteristics and their lives. Certain sculptors, departing more or less widely from the instructions, sent in their ideas for this monument, but they were ruled out of order and the whole matter was shelved for another indefinite period.

Very different from the ignorant dogmatism of our committees in sculptural matters is the method adopted by similar committees in France. A monument has recently been erected in Paris in honour of Gambetta, and the committee, acting on a wise and liberal principle, and desirous of having something away from the usual statue, &c., simply invited sculptors at large to send in competitive designs. A limited number of what were evidently the most meritorious was selected, and the authors of these were each granted a sum of money to work out or mature their sketch designs, the final result being that the monument now erected is a most magnificent work of art—a beautiful harmony of architecture and sculpture, telling its story in language

bellishing their city. As it is, instead of a beautiful kosmos, they have effected little less than a chaos; or perhaps it would be more correct, and at the same time more charitable, to say that George Square is like a monumental store, where the objects are placed incongruously here and there, in the expectancy of their being gradually removed to occupy more permanent positions. The truth is, the function of supervising such matters is one beyond the untrained ideas of members of shifting committees of successively changing Town Councils. And no reformation in this direction is to be expected till such men honestly confess their ignorance and incapability of properly treating questions that lie far above and apart from their ordinary walks, and hand over the responsibility to men who have made art the pursuit of their lives, just as these same councillors and committeemen have made their various vocations their life-long and engrossing study. I am afraid, however, that for a considerable time to come the committeemen will blindly rush in where even artists modestly tread, leaving behind him such ugly footprints as I have partially described.

I would also call your attention to two of the many memorials raised throughout France to the officers and men who fell in the '71 war. There is something awe-inspiring, something that makes one stop immediately and think

## Correspondence.

### REGISTRATION OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.  
LONDON, W.C.

DEAR SIR,—I have read the interview with Mr. Arthur Cates on the question of the registration of architects in the copy of your Journal of July 19th. I know Mr. Cates to have been a hard worker in the cause of the education of architects, and I as well as others much appreciate the energy with which he has carried through much valuable work with regard to the profession. Still at the same time I am bound to differ from Mr. Cates in his arguments and reasons against a Registration Bill, as they are not only inconclusive, but (I trust he will forgive me for saying so) illogical.

I pass over the question of what has been done in other countries, but I think it will be found that in many other countries, and in Germany particularly, examination is required, and an assured status is given to the competent architect.—Mr. Cates says:—"The first step towards placing the practice of architecture in a satisfactory position with the public would be to establish it as a profession, to secure the satisfactory education of its members, and in so far secure to the public that the possessor of an authoritative diploma had a certain minimum of knowledge." This is exactly what the Registration Committee propose to do. The whole difference between the method proposed by Mr. Cates and that proposed by the Registration Committee is, that Mr. Cates would do it by means of a *voluntary* examination before the Royal Institute, the Registration Committee by a *compulsory* examination, either before members of the Royal Institute, or a Board of Examiners constituted from them and others under an Act of Parliament. I put it at once that the public under the Registration Committee's scheme would be safe; under that of Mr. Cates they would not. If argument is required to show that I am correct it is to be found at once and conclusively in the fact that those who wish to join the architectural profession, who are absolutely or even partially incompetent, will, as long as they can, enter the profession without examination. They are the last people in the world who will ever offer themselves for examination. What, therefore, does it matter how many men put themselves forward for voluntary examination by the Royal Institute, so long as it does not prevent the incompetent man entering the profession?

A further argument, equally conclusive, is that outside the Royal Institute of British Architects there are twenty times as many architects as there are within it; and while I am pleased to say I believe a considerable number of these are competent men, as, indeed, many of them are leading men in the profession to-day, still, there are very large numbers who must undoubtedly be incompetent, and who naturally and necessarily are not intending to offer themselves for examination by the Royal Institute. Mr. Cates goes on to deal with the matter as a question of entering the Royal Institute. Now, I freely acknowledge, and do so willingly, the very great services which have been done to the profession by the Royal Institute; to the admirable way it is conducted, and the efficacy of its examinations, I am also willing to bear witness. The Institute (though not the only Society) is undoubtedly the leading Society, and I will even put it a long way before any of the other societies. Experience, however, has proved that it is impossible to join (not only in this but in any profession) all its members under any one voluntary association; the question at issue therefore cannot be furthered or helped by a discussion of the advisability of all architects belonging to the Royal Institute.

I quite acknowledge that "strength lies in unity," but I absolutely disagree that "the advocates of the Registration Bill would do well" (or even be right) "to show the real earnestness of their desire by becoming mem-

bers of the Institute, and ultimately by force of numbers influence the action of that body in the direction they desire." The arguments against even the possibility of such a course are many. To wait until such a Utopia as all the members of the profession joining together in one society has been accomplished is practically to put off the date for compulsory registration until the world will need architects no longer. I quite agree it might add to the funds and add to the prestige of the Royal Institute if all who are in favour of registration, and those who are trying to work for that end, were to join its ranks; but if they did, has there been anything which has shown any probability that the Royal Institute would be influenced to take action? I am fain to doubt it. I think the statement made by the president of the Institute at its last public dinner speaks absolutely against any such probability. The feeling expressed in the speech, too, is one hardly calculated to encourage those who earnestly desire to see the profession joined into one great body, feeling satisfied that it was worth while to come forward; unless they wished very much to risk a rebuff. The question of registration has been several times before the Royal Institute, and from time to time resolutions in its favour have been passed, but no action of any description has been taken towards that end. Neither has any action been taken with a view to draw the profession together, nor any action to elicit opinion on this question from the various provincial societies on the part of the Institute. Now the Society of Architects, willing as it is to leave it for the Institute to lead the van, if it will only make up its mind to do so, has taken very great pains, and gone to very considerable expense in trying to ascertain the opinion of architects in the great provincial cities of the kingdom, and I am happy to say that in no case whatever has the society visited any city in which it has met with a rebuff. Indeed, with extraordinary unanimity resolutions have been passed expressing the desire for compulsory registration, and the necessity for Parliamentary action.

Mr. Cates in conclusion says, that he cannot accept the arguments which he has generally heard put forth in support of a Registration Bill as in any way effective, and he says he does not believe that there is any analogy between the professions of law and medicine and that of architecture. Well, I have supplied some arguments in this letter; can Mr. Cates or anyone controvert them, or can they show arguments on the other side which shall appeal more closely and more thoroughly to the common sense of the public? The architect has power over the purse of the public to a very large extent, and he also has the health of the public to a very large extent in his hands. And apart from the question of art, which it is most desirable should be made a chief study, the question of sanitation is of such importance that even, if for that alone, every man who professes to deal with it should be compelled to pass an examination before he is allowed to practise. My desire is not that of protecting the architect. A competent man will make his mark whether he has compulsorily passed examinations or not, and whether he belongs to any society or not; this is a fact which has been proved over and over again. But the public cannot protect themselves. It is useless to say that the public should see that they are employing a competent person, or one, we will say, who even belongs to the Royal Institute. It is perfectly obvious that the public have not had this brought to their minds, and they necessarily obtain assistance from architects in their neighbourhood. They cannot be secure in this way, any more than they could have been in the past with regard to the medical profession, that the person they employ is competent; and such security can only be obtained by it being compulsory that examinations shall be passed before an architect shall practise. I must apologise for occupying your space to such an extent. The subject is an important one, possibly to the architect, but certainly to the public at large.—Yours, &c.,  
WALTER EMDEN.

## Enquiries Answered.

The services of a large staff of experts, including all those engaged on "Specification," are at the disposal of readers who require information on architectural, constructional, or legal matters. Questions should in all cases be addressed to the Editor.

### GREEN STAIN.

To the Editor of THE BUILDERS' JOURNAL.

BEBBINGTON.

SIR,—Will you kindly inform me through your Journal of a good green stain for oak, for picture frames.—Yours &c.,  
W. A.

A good green stain may be made by dissolving 4ozs. verdigris and  $\frac{1}{2}$ oz. of indigo in three pints of good vinegar. The proportion of indigo may be modified to suit the shade required, and, in order to get a good effect, the stain should be applied hot, so that it may sink into the pores of the wood. Aniline dyes also make good stains, and almost any shade can be obtained by admixture of the various colours. Another green stain may be obtained by first treating the wood with a concoction of turmeric, followed by an application of Prussian blue.  
H. E.

### MEMBERSHIP OF SOCIETY OF ARCHITECTS.

To the Editor of THE BUILDERS' JOURNAL.

CROUCH END, N.

SIR,—Will you be good enough to inform me where I can obtain full particulars of how to become an M.S.A.; and also will you inform me how many exams. there are to pass, and if there are any fees of any kind.—Yours &c.,  
S. H. B.

Examinations qualifying for membership of the Society of Architects are held once a year; the fee for such examinations is two guineas, but in the event of failure to qualify in any of the compulsory subjects a candidate will be admitted to a subsequent examination in these for a further fee of one guinea. All who qualify for admittance to membership will be elected on the payment of one guinea, half the usual entrance fee. Members of the society have to pay an annual fee of one guinea. There are three sections of the examinations to pass, namely: 1. Architecture, 2. Building Construction and Materials, 3. Practice. Further particulars may be had on application to the secretary of the society, at St. James's Hall, Piccadilly, W.

### R.A. GOLD MEDAL, &c.

To the Editor of THE BUILDERS' JOURNAL.  
NEWCASTLE-ON-TYNE.

SIR,—(1) Can you tell me where to apply to for particulars respecting the Royal Academy Gold medal for this year? What other prizes of a similar nature are there to compete for besides the R.I.B.A. medals?

(2) Also can you supply me with or is it possible to obtain a list of works carried out by Mr. Norman Shaw in the neighbourhood of Godalming (Surrey) and round about? I suppose to ask for a list of all the more interesting modern works in that region would be too wholesale a request.—Yours, &c.,  
B. B.

(1) Only students attached to the Academy Schools may compete for the R.A. gold medal; and the regulations as to admission to the schools can be obtained from the Secretary of the R.A., Burlington House, W. Smaller prizes of a similar nature to those offered by the R.I.B.A. are given by several of the provincial societies, but in all cases it is necessary to belong to the particular society in question in some way or other.

(2) If application be made to Mr. B. T. Batsford, 94, High Holborn, W.C., he might be able to assist, as he may know of books dealing with the district of Godalming—and there certainly is one describing Mr. Shaw's works.

## "BUILDERS' JOURNAL" COMPETITION.

WE reproduce this week in our inset plates two more of the designs for a country house, submitted in our recent competition; both of these were highly commended by our assessor, Mr. Edward S. Prior.

### DESIGN BY "CARACTACUS."

The design by "Caractacus" (Mr Charles M. Childs) was accompanied by the following description:—

**PLAN.**—The accommodation is as set forth in the conditions; with the addition on ground floor of a small verandah, which could easily be utilised as a conservatory, and on first floor of a dressing room.

Whilst the author has endeavoured to plan the rooms in a manner calculated to insure convenience, he has at the same time imparted such a degree of "mystery" as is compatible with that convenience.

The Hall is reached through a pentagonal vestibule, and is placed in the centre of the house; at one end is a long, low, heavy-mullioned window looking on to the garden, and at the other end is a raised recess entered by way of a low-beamed arch. This recess has a seat below the small window the two side lights of which are filled in with dark coloured leaded lights taking the extenuated tulip form. On one of the two remaining sides is a recessed and raised fire-place with seats on either side; on the other is the wide staircase with a hood over it, having a suitable motto thereon. The room will be treated with plastered walls, and 6in. by ½in. dark-stained oak stuff planted on same—the rafters, purlins, and collars, will show. The garden may easily be reached by passing out of hall and into garden lobby.

The dining-room opens out of the hall, and is treated to level of picture-rail with ½in. dark-stained V-jointed matchboarding, above this a deep splay returns round room, giving a very good, but quaint, effect, emphasised by the raised fireplace recess at the end of the room, faced to level of opening with red brickwork with wide joints. A door is provided opening into servery.

The boudoir is entered off the staircase, but door is recessed from same. The room is in easy communication with the bedroom. At one end is an angle nook with seats on either side, and also a seat in bay window. The garden can be viewed from the side light, whilst the morning sun streams through the window proper.

The study does not open directly out of the hall but is cut off by means of a well-lighted lobby, this gives the room the necessary seclusion from noise. Access to first floor can be obtained by way of passage and up three steps without passing through the hall. Panelling to a height of 4ft. and a stencilled frieze goes round the room with the floor joists showing. This room looks on to the north, east, and south, thus giving a varied aspect.

The servants' quarters are entirely isolated from the house proper; this has been obtained by keeping their bedrooms on ground floor. In addition to the requirements there is a pantry, servery, and tradesman's entrance. The author would suggest that one of the servants' bedrooms be used as a sitting-room, and not a bed-room; this would leave two sleeping rooms for their accommodation.

A servants' staircase is provided so as to give the servants access to first floor without entering through the house proper.

**FIRST FLOOR.**—Leading off a spacious landing is the best bedroom; a small angle nook with seat is provided, but should this not be required it could easily be omitted. As required in particulars a bathroom is placed in connection with this room, and a dressing-room has been added in addition, these rooms being en suite.

A gallery 3ft. 6in. wide extends round two sides of the large hall, and has a long window with two small bays. This will give a considerable amount of light to the hall.

The ordinary bedrooms, five in number, are

conveniently situated. Three of these are entered off a well-lighted hall, and the remaining two off an equally well-lighted corridor. This corridor has a lounge and window recess looking towards the garden. The rooms are so planned that the beds shall not be in draughts.

All the bedrooms without exception have fireplaces, and there is a second bath-room in connection with these rooms.

In addition to the stated requirements, there is a housemaid's closet, linen closet, and servant's staircase; whilst, if required, a large box-room could easily be planned in the roof.

The general treatment of bedrooms will be plain and simple, the doors to be 1½in. with ½in. veneer planted on to form raised panels, and moulded skirting to return round doors as architrave.

**CONSTRUCTION.**—The general construction will be 9in. by 6in. oak posts, finished on outside and inside (except where match-boarding is shown) with plaster, and rendered in centre. This forms a weather-proof house, and is less costly than brickwork with 1½in. stuff planted on wall, and, besides, is more truthful.

The ground floor walls generally will be 4½in. brickwork whilst the upper floors of stud partition.

**ELEVATIONS.**—The author has avoided all crude and incongruous forms for the sake of what is at times falsely termed "originality," and has endeavoured to obtain a picturesque, but at the same time architectural effect by means of simple and unbroken lines.

PERSPECTIVE SKETCH BY CHARLES M. CHILDS.

The exterior will be of half timber work on a red brick base, the posts being 9in. by 6in., dark stained oak, finished between with selentic plaster set back ½in. from face of posts, giving the black and white effect which is so pleasing.

The windows will be quarry glazing with wide lead courses.

The roof to be covered with Broseley Tiles, or, if desired, thatch could easily be substituted, but strongly recommend the former, the latter being so very insanitary and inflammable. The eaves are 3ft. wide, finished flat and soffit.

**DRAINS.**—The drains will be the best of their kind.

**CUBICAL CONTENT**—59,560 cubic feet, taken at 8d. = £1,990—say £2,000.

### DESIGN BY "TORSO."

The descriptive note accompanying the design by Messrs. H. T. Rees and H. M. Macpherson ("Torso") is as follows:—

**EXTERIOR.**—The material proposed to be used for this house are, for the walls up to 3ft. above the ground random coursed rubble, colour washed, if thought necessary, and above this 8in. by 8in. oak timbering split out of 10ft. logs with adzed faces and intervals filled with brickwork, with rough-cast facing (cream). Gables to be faced with rough-cast tinted cream-colour. Casements to have oak frames with wrot iron fittings and leaded quarries. Chimney stacks to be of random rubble. Roof to be thatched.

**INTERIOR.**—Hall to be fitted with panelled dado.

Walls of Ingle-nook to be faced with red-rubber bricks putty painted.

Balcony round hall to be supported on wrot oak cantilevers with wrot oak balustrading.

Floors to be of wood block in all living rooms. Dining-room to be panelled in oak with oak ceiling. We anticipate the price of building to come within the sum stipulated.

## ART SCHOOL FOR LEEK.

THE Duchess of Sutherland laid the corner stone of a new School of Art, Science and Technology, and County Silk School, on July 24th. The buildings have been designed by Messrs. Wm. Sugden and Son, F.R.I.B.A. The school is an extension of the adjoining Nicholson Institute, the gift of the late Joshua Nicholson, and which was the work of the same architects, who are responsible for the major part of the principal public and private edifices erected in the town during the last half century. The Nicholson Institute already provides a public reading room, and has associated with it a free library, a reference library, a museum, and a picture gallery. The corner stone has been excellently sculptured by Mr. A. Broadbent, and is emblematic of the genius of such an institution.

The execution of the scheme will involve an outlay of nearly £10,000, reckoning the cost of

equipment, furnishing, &c. It is hoped that in time the scope of the project may be enlarged so as to embrace secondary education, and the plans have been drawn with an eye to such a development. The enterprise has been rendered capable of achievement by the co-operation of the well-to-do residents with the Urban District Council, part of the funds being raised by personal contributions, and part being provided from public resources. The local authorities have obtained leave to borrow £4,000, the Technical Instruction Committee of the county have made a grant of nearly £2,000, and the Science and Art Department assist with nearly £500. Individual subscriptions amount to about £1,500.

On the ground floor of the buildings there will be a chemical laboratory, 31ft. by 22ft., a balance room 13ft. by 7ft., a domestic school, 27ft. by 22ft., a physical laboratory, 27ft. by 20ft., all over 15ft. high; and a manual instruction room, 29ft. by 20ft., and a weaving shed, 29ft. by 30ft., lighted by ample north skylights, both averaging 18ft. high. Also entrance hall, boys' cloakroom, &c., and spacious corridors are here provided. There will be separate entrances for boys and girls, in view of developments in the future for secondary and higher education purposes. On the mezzanine floor will be the mistress' room, &c., and on the first floor the science lecture theatre with gallery, 31ft. by 22ft., and four classrooms, all from 15ft. to 17ft. high. There will also be a master's room, preparation room to lecture theatre, a girls' cloakroom, &c., and communication with the Nicholson

Institute on this floor. In the master's room will be fixed an ancient plaster ceiling, carefully taken down from the sixteenth century Manor House in the Market Place (lately pulled down. Also round the walls will be placed some very old painted chestnut wainscoting from the Chateau de Lormont, near Bordeaux, formerly the residence of the Archbishops of Bordeaux, whose arms are painted on the panels; the Black Prince lived in this chateau, and his son, Richard of Bordeaux, was born there. The wainscoting was rescued from destruction by Mr. Larnier Sugden.

The exterior of the new buildings are plainly but proportionately treated. The chief decorative features, in addition to the corner-stone, will be modelled spandrels, by Mr. Broadbent, above the windows, symbolising the Arts and Sciences. Mr. Grace, of Leek, is the builder, and Mr. M. Carding his sub-contractor for the plumbing, &c. Some old dilapidated cottages have been pulled down at the back giving an open quadrangle for the public use, bordered by neighbouring trees, thus improving the light and air, both for the new buildings and the Nicholson Institute. Another old block of cottages which similarly hamper the buildings ought to be disposed of in the same way.

After the stone-laying the architect, Mr. Sugden, presented Her Grace—on his own behalf—with a silver tablet commemorative of the occasion, and introduced the author of the design, Mr. A. Broadbent, a rising young sculptor. The souvenir was in the form of a miniature reproduction of the stone, artistically cut, and framed in wood.

The architects are visiting the best examples of the most modern technical schools both in this country and abroad, as the committee and their indefatigable chairman, Mr. Hall, are determined to have the appointments and furnishing of the best and latest type. Mr. Kineton Parkes, the principal, is equally taking the closest and most energetic interest in everything connected with the enterprise.

**New Presbyterian Church at Newcastle.**—The Building Committee of Blackett Street Presbyterian Church invited four local architects to send in competition plans for the proposed new church in College Road (opposite the Durham College of Science), the plans to be unsigned or under motto. Four sets of drawings were received, one set unsigned, the other three under the mottoes "Experientia Docet," "99," and "St. Andrew's." The Committee unanimously decided on those sent in under the motto "St. Andrew's," which proved to be the design of Messrs. Badenoch and Bruce, of 55, Pilgrim Street, and they have been appointed architects for the work, and are now busy with plans for the Town Improvement Committee.

**Proposed Fever Hospital at Skipton.**—At the Skipton Town Hall on Tuesday last week Mr. R. Deane Sweeting, one of the inspectors of the Local Government Board, held an inquiry into an application by the Skipton and Silsden Urban and Skipton Rural District Councils, for permission to borrow £16,000 to erect a joint infectious diseases hospital at Skipton. Mr. Edgar Wood, the clerk to the joint authorities for this purpose, gave evidence concerning the present infectious hospital at Skipton, which, he said, was built in 1888, at a cost of £400. The estimated cost of the proposed hospital was £14,958. Mr. G. E. Balshaw, the architect, said that on the ground floor of the hospital there would be a waiting room, rooms for medical officer, matron and nurses, and kitchen, scullery and stores. On the first floor there would be six bedrooms and other accommodation, and on the second floor seven bedrooms and other conveniences. In the isolation block there would be four single wards, for two separate diseases, if necessary. There would be two pavilions for scarlet fever, and two wards, containing eight beds for women and children and six beds for men. Other evidence having been given the inquiry terminated, and the inspector and others visited the proposed hospital site.

## Bricks and Mortar.

*"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."*—JOHN RUSKIN.

### Art Exhibition at Kendal.

A LARGE and interesting exhibition was opened on July 6th, at Abbot Hall, Kendal, and will remain open until the 26th inst. Kendal is in the heart of a district where a strong revival of the artistic crafts has taken place, and a special effort has been made to bring together an interesting collection of works of art, in view of the fact that eight years have elapsed since the last exhibition. The exhibition comprises oil and water colour paintings; decorative designs, drawings in black and white; prints; wood and stone carving; metal work, including repoussé and other hammered or pierced work; modelling in terra-cotta, wax and plaster; gesso; pottery; bookbinding and leather embossing; textiles and embroidery; and photography. A different line has been taken to that adopted at the last exhibition. The last exhibition was competitive and consequently amateurish, but the present is non-competitive and primarily educational, most of the work shown being professional. The works on exhibition have been divided into three sections:—1, Work exhibited by artists and craftsmen for sale or otherwise; 2, Loans from various sources; 3, Loans from South Kensington. The excellent character of the exhibition is in great part due to the earnest work of the hon. secretaries, Messrs. Cuthbert Rigby and Arthur W. Simpson.

### Government Control of Fire Protection.

THE evidence before the Select Committee on Fire Brigades, was closed last Tuesday week. Mr. Herbert Brown, standing hon. counsel to the National Fire Brigades Union, declared himself in favour of conferring compulsory powers on a Government department over Local Authorities in respect to the establishment and maintenance of Fire Brigades. He recommended that the procedure in regard to protection from fire, as between the Government department and the Local Authority, should be similar to that in regard to sanitary matters under the Public Health Act of 1875. Compulsion should be applied by means of *mandamus*. Mr. Kershaw, one of the Assistant Secretaries of the Local Government Board, also gave evidence, advocating the extension of the powers of Local Authorities in regard to protection from fire. Mr. Edward Sachs, Chairman of the Executive of the British Fire Prevention Committee was next examined. His evidence primarily lay in the direction of the safety of life in public buildings, such as theatres, and in the technical knowledge of fire brigade officers. His opinion was that it appeared that no control was at present exercised on the efficiency of private firemen having posts in places of public entertainment and the like, much less any control as to their knowledge of such fire preventive measures as a *bona-fide* fireman or watchman should be conversant with, and the result was, speaking generally, that the private staff of firemen in public buildings was of doubtful value. Then as re-

gards the manning of fire brigades, Mr. Sachs laid great stress on the necessity of the building and mechanical trades being well represented, and that the officers in particular should be thoroughly conversant with construction and building materials. For officers in big towns, the retired Royal Engineer officer was advocated as a suitable commander, whilst for the officering of smaller brigades Mr. Sachs seems to favour the local borough and town surveyors, the local engineers, architects, or builders. The great importance of applying technical knowledge and the results of modern science to the purposes of the fire service was particularly emphasised, and attention called to the fact that the fire service of the country was becoming more and more a technical problem than has been formerly the case. Commander Wells, Chief Officer of the Metropolitan Fire Brigade, said he had two alternative proposals in regard to a training institution for Fire Brigade officers—one for a school in connection with the Metropolitan Fire Brigade, and the other for an independent establishment under the Government. He foresaw great difficulty in maintaining a school in connection with the Metropolitan Fire Brigade, and he had very little hope of seeing such an institution as that established. Army, navy, and police officers should have some training at the school he proposed. The establishment he had in his mind would cost £4,800 a year if attached to the Metropolitan Fire Brigade, and £6,100 if unattached.

### Newcastle Antiquaries.

THE Newcastle Society of Antiquaries held a meeting last Wednesday, Mr. Richard Welford presiding.—Mr. E. O. Heslop read a memoir, by Mr. F. G. Holmes, of Greenwick, dealing with the geology of the district round about Carlisle. Mr. Holmes presented certain considerations in connection with the Roman works on the Solway, leading to the presumption that there had been no perceptible change in the level of the district since the Roman occupation. There had been no alteration in the relative positions of the land and sea.—Mr. R. C. Clephan exhibited a portion of a brick, which had been found in the demolition of an old house. On one side there were impressed medallions, with the figures of a king and queen, and on the third medallion a castle. There were upon the portion the first three figures of the date, 157. That would make it in the time of Elizabeth, so that it would not be an English brick. It was probably a German or Flemish sixteenth century brick.—Mr. R. O. Heslop, for Mr. George Forster, exhibited a bronze celt which had been found in the River Tyne at Newburn. It was remarked that at their last meeting they had a spearhead, which was found at the same place.—Mr. Welford said there was a project for the making of a dock at Jarrow Slake, and suggested that the excavations should be watched for "remains."—Mr. Sheriton Holmes presented a stone which had been found at North Jesmond.

### St. Dunstan's.

LAST Tuesday week a sitting of the Consistory Court of London was held at St. Paul's Cathedral by Dr. Tristram, Q.C., Chancellor of the Diocese of London, to hear the petition by the rector and churchwardens of St. Dunstan-in-the-West, Fleet Street, E.C., for a faculty authorising certain alterations in the church consequent upon an agreement which had been entered into for the sale by the rector and churchwardens of the western portion of the forecourt of the church to the Law Life Office for the extension of their premises in consideration of the payment of £4,500, which it was proposed to ultimately devote to the erection of a rectory house on the eastern side of the forecourt. The case for the rector and churchwardens was heard on May 31st. The application was then unopposed, and the Chancellor intimated that he would grant the faculty asked for, subject to his visiting the church and ascertaining what provisions and covenants were necessary to insert in the faculty. Mr. F. F. Daldy, who appeared for certain parishioners opposing the scheme, said

the land which it was proposed to sell was consecrated ground, and the Court ought not, therefore, to grant a faculty to allow it being built upon for secular purposes. The open ground was kept as an approach to the church, and the powers of the trustees to sell it were exhausted. From an architectural point of view the scheme was objectionable, as it would ruin the beauty of the Gothic tower. — Mr. L. T. Dibdin, who appeared in support of the application, said the points raised by Mr. Daldy were before the Court at the last hearing, when the Chancellor said he would grant the faculty. He was not asking the Chancellor to express any opinion whether there was power to sell the land or not, or whether it was a good or bad contract. The Court had no jurisdiction to decide a question of title. The existing premises of the Law Life office, west of the church, were erected on part of the site of the old church seventy years ago under private Act, and no question of title had ever been raised. A large amount of evidence was given on the ground that the building-in of the tower would completely spoil its architectural beauty, in reply to which Mr. Dibdin said the evidence of Mr. Caroë, the architect to the Ecclesiastical Commissioners, was to the effect that the loss to the building from an æsthetic point of view would be small compared with the benefit the parish would derive from the funds resulting from the sale of the land being applied to the provision of a house for the rector. The Act of Parliament had authorised the sale of any part of the site of the old church not required for the new.

#### The Faculty Granted.

The Chancellor, in giving judgment, said that all the Court had power to do—and all that it was asked to do by the rector and churchwardens—was to grant a faculty, assuming that the trustees had power to sell the piece of land to the Law Life Association, to allow one window, which was of no practical use, to be blocked up, and another to be improved if anything. He inspected the church on the previous day very carefully, and he came to the conclusion that the evidence which was produced by Mr. Dibdin at the last hearing was in entire accordance with the opinion which he formed as to the result of the scheme. The window facing Fleet Street, which would be blocked up, lighted a staircase which was seldom used, and which was mainly used when any person was required to have access to the clock for the purpose of winding it up, and in order to make use of that staircase it was necessary to have gas lamps. The staircase also led to the organ gallery. There was another staircase, much more convenient, on the other side, which was also used for gaining access to that organ gallery. There was a painted window in the church, on the west side, which, no doubt, would be to a certain extent darkened by the erection which the Law Life Office contemplated making on the land, but they proposed to lighten it artificially, in a way which would really let more light into the church than it had at present. The third alteration he was asked to sanction was the closing of a passage leading to a vault beneath the church. The passage itself was underneath the present building of the Law Life office. To that vault access could be procured at the back of the church just as conveniently as at present. The Law Life office proposed to make a new entrance into the vault and to close the old. With regard to the present opposition, it was said in the first place that the scheme would spoil the appearance of the tower. Mr. Dibdin produced, however, several witnesses, who gave it as their opinion that the building would harmonise with the tower. They had the opinion of the vestry, of both churchwardens, and of three architects called by Mr. Dibdin in favour of the proposal, but there had been no architectural evidence in support of the opponent's view. He had looked at the site several times, and he agreed with the architects called by Mr. Dibdin. He thought that the building would not be detrimental to the appearance of the tower. The Court, therefore, were prepared to grant the faculty,

on the assumption that the trustees had power to sell the land. Mr. Daldy gave notice of appeal from the Chancellor's judgment.

**Fire Tests.** LAST week, Sir John Taylor, K.C.B., of H.M. Office of Works, and Mr. Thomas Blashill, late architect to the L.C.C., presided at a series of fire tests undertaken by the British Fire Prevention Committee at their Regent's Park Station. The strictly limited company of visitors included distinguished representatives from the War Office, Admiralty, and other Government departments, as well as from the London County Council and the great insurance companies. The tests, which were conducted by Mr. Edwin O. Sachs (Chairman), Messrs. Max Clarke, F. Hammond, Ellis Marsland and Robert Mond, included some interesting investigations with "non-flammable" wood, wire glass and a ceiling of slag wool, and a number of very important results were obtained. The object of the test with "non-flammable" wood was to ascertain in a reliable and independent manner whether thin boards (3/4 in. rebated) would sustain or spread flame when in contact with fire of such high temperatures as 1,000deg. Fahr., for terms of five, ten, or fifteen minutes respectively. The wire glass both in skylights and windows was to show its resistance under a fierce fire increasing to a temperature of 1,000deg. Fahr., water being applied during and after the tests, which lasted thirty and forty-five minutes respectively, and the slag wool ceiling was to withstand a fire increasing to a temperature of 2,000deg. Fahr. for an hour, followed by the application of water. The reports embodying the important results of these tests will be issued in due course.

#### Architecture in France.

THE June and July numbers of that excellent art magazine, the "Revue de l'Art Ancien et Moderne," contain articles on the Salons of 1899, dealing with painting, engraving, sculpture, and architecture. The number for June also contains articles on the prophetess Sambeth of Bruges, by M. Henri Bouchot; Goya, by M. Paul Lafond; the designs of scenes in the Trojan War, recently acquired by the Louvre, by M. Jean Guiffrey; and the July number contains articles on the Bardo Museum at Tunis, and the antiquities discovered by M. Gauckler, by M. Georges Perrot; Goya, continued; the two idealists, Gustave Moreau and Burne-Jones, by M. Léonce Bénédite; and the monuments of Damietta and Mansourah contemporary with the time of the Crusades, by M. Al. Gayet. This year's Salon has been remarkable for designs for a number of important buildings and a number of monuments, which are being erected in large numbers. These latter designs being so urgently wanted are generally characterised by the want of thought and their obvious hurried preparation. The chief interest of the architectural portion of the exhibition seems to centre in several designs submitted in the recent international competition for the University of San Francisco, in which all the winning designs were by students of the French school. A design for a sanatorium in the typical French style by M. Hannotin is reproduced, but it is considerably below the usual standard of the magazine, and we do not like its wearying duplication of parts; it looks too much like a row of French flats.

#### An Artistic Street Station Indicator.

THE Liverpool Tramways Committee, with the view of facilitating the journeyings of the city electrical trams and affording ample guidance to travellers as to the stopping places which have been established on the lines, have resolved to place what are called Street Station Indicators on the route to and from the Dingle. These indicators consist of an ornamental and conspicuously coloured pavement, 4ft. square, formed of red granite concrete, and surmounted by a border of white granite ornamented with an incised foliated design. The appearance of the square will be artistic, and it will be easily seen from a distance by the pedestrian. Each indicator will contain the name of the thoroughfare in

characters legible at all times of day and night. An arrow will indicate the direction of the cars, and the destinations will be clearly stated in white characters on a dark-red background. The indicators to equip the Dingle route will be forty in number, and have been made by the City Mosaic Company, of Liverpool, the concrete work involved being done at the headquarters of the Stanley Land and Brick Company, of Stanley. These artistic indicators will certainly be a great improvement on the iron street name tablets, which are sometimes placed beyond the limit of vision, and at night are illegible to all. It is to be hoped that the new idea will be generally adopted.

#### Popularising Art.

A LOAN picture exhibition organised by the Woolwich District Trade and Labour Council and the Co-operative, Temperance and Friendly Societies of the district, which will remain open during this and next week was recently opened at the Woolwich Polytechnic Institute by Mr. Walter Crane. The exhibition consists of nearly five hundred pictures of ancient and modern artists, including works of Raphael, Sir Joshua Reynolds and Rossetti. The Circulation Department at South Kensington Museum has lent a collection, and there are also a number of works of the best-known artists in black and white. The committee has made a charge of 2d. for admittance to the exhibition, so that it may be self-supporting.—Viscount Morpeth, who presided at the opening ceremony, said they were helping to raise the people's ideals by holding loan picture exhibitions, which he hoped to see established as permanent exhibitions in all parts of London.

#### Mr. Walter Crane on Art.

MR. WALTER CRANE, in declaring the exhibition open, said that the name of Woolwich was rather more associated in the public mind with arms than with arts; but some of them would like to depose Mars and set up Minerva. At any rate, for the present the two powers were to walk side by side. Looking at London a the wealthiest city in the world, and a city, as some contended, of some beauty, one found in the mantle patches of purple and gold concentrated in certain places, and vast areas of sackcloth only. The attempt to distribute those patches of purple and gold more liberally and consistently was represented in such exhibitions as that which they saw in that hall, as the result of the energetic work of Mrs. Bridges Adams and her committee. There was no lack of material for embroidering London with the purple and gold of art. They only wanted to find out just where it ought to go, and who were willing to take the trouble of arranging the pictures. He thought that London, and England generally, might very wisely adopt some organisation for circulating exhibitions, so that collections of pictures could be passed on from one district to another, as was often done in Germany, and the whole country could get the benefit of the best art at a small cost, instead of confining the collection to one town or district. Art, of course, was not solely comprised within pictures. It was not possible to separate any intellectual work of humanity from association with art; and it ought to be made a more familiar friend in the daily life instead of being only an occasional visitor. If refinement, beauty, and health were necessary things of life, Art was useful even in a positively utilitarian sense. The workers ought to see that every side of their nature was supplied, lest they became a half-starved and a narrowly-specialised race. Pictures, of course, would not do everything. The people must have bread and butter before cake. In many parts of London other work was more important than picture exhibitions. He would like to see one township or district emulate another so that all might compete for the cleanest and most beautiful streets and open spaces, and the best fed and most intellectual and healthy inhabitants, and to gain those advantages for the people Art must take up her abode with them permanently.

## Keystones.

**The New Catholic Club at Ainsdale,** which is situated in the Liverpool Road, was opened last Thursday. The club is a well equipped corrugated iron structure, 60ft. by 30ft., the cost of which has been about £400.

**A New Wing at Ryde Hospital** was opened by the Queen last Friday. About half an hour previous to the Queen's arrival Princess Henry of Battenberg unveiled a bust of Her Majesty in front of the new building.

**The Lichfield Victoria Nursing Home,** which has been erected as a memorial of the Diamond Jubilee of the Queen, was opened last week. The site and the building have been acquired at a cost of £1,003.

**A New Sunday School at Blackpool.**—Foundation stones were laid last Thursday of the Methodist New Connection Sunday School at Layton. The new building will cost about £850.

**Statue of Flora Macdonald.**—The Flora Macdonald statue was unveiled on Castle Hill, Inverness, last Wednesday afternoon, by Mrs. Fraser, daughter of Captain Henderson Macdonald, the donor of the statue, which has cost £1,000.

**A Technical School for Redditch.**—The Worcestershire County Council have granted the sum of £600 towards the erection of the proposed new technical school for Redditch, for which a suitable site in Casemore Road has been purchased, and plans have been passed.

**The Tender of the Patent Victoria Stone Company,** of Hamilton House, Bishopsgate Street, has been accepted by the Ilford Urban District Council for the supply of 3,100ft. of Norway Granite kerb, 60ft. of circular kerb, and 1,560 square yards of Victoria indurated stone slabs.

**Asylum Extension at Leicester.**—The foundation stone of a new two-storey wing, which is being erected at the borough asylum, Humberstone, was laid recently. The new buildings, which include an administrative block, are to cost about £76,000, and will give accommodation for 330 patients.

**Proposed Isolation Hospital at Menston.**—An inquiry was made at the Wesleyan Schools, Menston, last Tuesday week, into the application by the West Riding County Council for sanction to borrow £2,300 to erect an isolation hospital at Menston to serve the three townships in the Wharfedale Union.

**New Chapel at Horbury.**—The foundation stone was laid recently of a new Free Methodist Chapel and Sunday School. The site is in High Street, and the cost of the building, of which the Sunday School will occupy the lower storey, is estimated at £2,000. The chapel will seat about 300 persons.

**The Monument to M. Faure.**—*Apropos* of the wish to grant to Madame Faure a spot at Père Lachaise between the tombs of Floquet and Anatole de la Forge, for a monument to the late President, it is now stated that she has accepted a new offer of ground near the tomb of Couture, and in front of that of Paul Baudry. The monument will be the work of M. René de Saint-Marceaux.

**Emmanuel Baptist Chapel, Plymouth.**—The trustees of Trinity Chapel, Plymouth, in consequence of inconvenience from street traffic and other causes, sold the building and secured a site for £700 in North Road for a new chapel. Plans were prepared for a building in the early Gothic style by Messrs. Weblin and De Bonville, and the tender of Mr. J. Paynter for £1,749 was accepted. The memorial stone of the building was laid recently.

**New Premises for the Newcastle Weights and Measures Department.**—At a meeting of the Finance Committee of the Newcastle Corporation last Thursday, the tender of Messrs. J. and W. Lowry, amounting to £2,045, was accepted for the erection of the Weights and Measures Department's new premises in the City Road. It was the lowest tender. The new building will adjoin the Carpenters' Tower.

**Master Plumbers' Gathering in Sheffield.**—The Executive Council of the National Association of Master Plumbers of Great Britain and Ireland paid a visit to Sheffield last Wednesday, and after holding a private business meeting in the afternoon at the Masonic Hall, met again in the same hall in the evening, and partook of dinner, given by the local branch. The chair was occupied by Mr. H. Cawthorne (president of the Sheffield Branch).

**Reopening of Semer Church.**—This church has been closed for six weeks for the purpose of restoration, during which time the old pews have been removed and replaced by carved oak benches, and the ground floor has been relaid with Minton tiles. Mr. J. Shewell Corder, of Ipswich, was the architect, and the work was carried out by Mr. J. H. Castle, of Bildeston. A new organ by Messrs. Norman and Beard, of Norwich, has been presented to the church by Mr. Charles Beard.

**Leadless Glaze.**—An important regulation has been issued by the Office of Works. It is to the effect that all articles for domestic use supplied under contract for the Public Department, the Houses of Parliament, and such of the Royal Palaces as are under their charge, shall be made with leadless glaze. Earthenware, stoneware, and glazed bricks used for sanitary or architectural purposes, have to be obtained as required by the surveyors of the department. It has been found impossible at the present time to insure an adequate supply of these articles made with leadless glaze; but the Office of Works are making enquiries with a view to arrangements which will effect this object.

**The N. A. P. Window Company, Limited.**

—A winding-up order having recently been made against this company, the statutory meetings of creditors and shareholders were held last week at the Carey Street offices of the Board of Trade. It was reported that the company was registered in November, 1893, with a nominal capital of £30,000, divided into 10,000 preference and 20,000 ordinary shares, and was formed to acquire certain patent rights for the manufacture of safety windows from Mr. William Youlten. By a contract dated July 10th, 1896, the company purchased the patents, plant, stock, &c., for £20,000, and Mr. Youlten was appointed managing director at a salary of £500 a year. The purchase consideration was satisfied by the issue of 15,000 ordinary and 3,000 preference shares fully-paid up, and £2,000 in cash. A prospectus was issued, but £5,567 only was subscribed. Attempts were subsequently made to raise further capital, but without success. In June, 1897, debentures for £1,000 were issued, but these were paid off in September, 1898. In November, 1898, debentures for £20,000 were created, and of these about £3,085 were issued for cash, 16,000 of them being given as security for a previous advance of £2,000. In June, 1898, an attempt was made to reconstruct the company, and the new N. A. P. Window Company (Limited) was registered with a capital of £200,000. The new company was to purchase the business of the old company for £150,000, but the flotation proved abortive. The amount subscribed by the public was returned and that practically ended the matter, as a winding-up order followed, and a debentureholders' action was commenced. A receiver was eventually appointed, who was now carrying on the business on behalf of the debentureholders. The company traded throughout at a loss, which was stated to be due to the fact that it became necessary to spend large sums on advertising and in management during the development and introduction of the windows constructed under the patents. The assets of the company were valued at £8,838, and were subject to claims on debentures amounting to £4,816, leaving net assets £4,022 against unsecured liabilities amounting to £8,000 or £9,000. Mr. W. Youlten, the managing director, said it was proposed to submit a scheme for the reconstruction of the company, but at present he could not give any definite idea of the details. After some discussion the meeting was adjourned until August 25 next, in order that a scheme might be submitted.

## Under Discussion.

### SANITARY INSPECTORS IN CONFERENCE.

The annual meetings of the North-Western and Midland Sanitary Inspectors' Association were recently held at Rhyl. The councils of the North Wales Centre and the Central Executive first met under the presidency of Mr. Bland, of Urmston. The hon. secretary, Mr. R. J. Hughes, in presenting the annual report, said that the past session might rank as one of importance to North Wales inspectors, as it had witnessed the first year's working of their centre as an integral part of the Association. The fusion of the new North Wales branch with the larger North-Western and Midland Association had been mutually advantageous. The gain of the branch from the exchange of thought and the interchange of ideas, the bolder policy pursued, and the increased status demanded by identifying themselves with the larger body who now shared their allegiance, were not to be lightly passed over. The chief advantage to the Association lay in the augmented numerical strength and area. The strength of the centre now stood at thirty-one members. The following officers were elected for the ensuing year:—President, Dr. Fraser, Carnarvon; vice-president, Dr. Williams, Penmaenmawr; chairman of committee, Mr. E. Worrall, Penmaenmawr; vice-chairman, Mr. W. H. Worrall, Bangor; secretary, Mr. R. J. Hughes, Rhyl; scrutineers, Messrs. W. Winslow, Denbigh, and R. E. Hughes, Abergelle; delegate to the Central Executive, Mr. R. Little, Llandudno. It was decided that the next meeting be held at Bangor.—The twelfth annual meeting of the North Wales District Centre followed, and was presided over by Dr. Frazer, of Carnarvon. The annual report was read and approved, and the following officers were elected for the ensuing year:—President, Sir Francis Sharp Powell, M.P.; chairman, Mr. Bland, Urmston; treasurer, Mr. N. Coates, Liverpool; hon. secretaries, Mr. H. H. Spears and A. Gleaves, Liverpool. A large number of new members were elected, on the recommendation of the centres. The meeting then resolved itself into committee for consideration of private business.—The third annual conference of members of the North-Western and Midland Sanitary Inspectors' Association followed, when Mr. John Sumner, Chief Inspector for Wigan, read a paper on "The New Food and Drugs Bill." Mr. J. T. Quinton, Public Health Department, Liverpool, next read a paper on "The Small Houses (Acquisition of Ownership) Bill." A discussion on the subject of the future of sanitary administration was opened by Mr. H. H. Spears, chief sanitary inspector for West Bromwich, and secretary of the Association. He argued that although sanitation was so much to the fore it was questionable whether any substantial progress was being made, owing to the number of factors which militated against sanitary progress. In his opinion, the present methods of administration by local authorities were open to severe criticism. The fact could not be lost sight of that members of local authorities would themselves be directly interested in the perpetuation of insanitary surroundings, and at the same time placed in a position to vote sanitary reform. Legislation did not appear to do much to alter the existing state of things, and the formation of small sanitary authorities did not help matters, as they could not afford to pay large salaries to competent men. The multiplicity of functions performed by public authorities rendered it impossible for adequate attention to be paid to public health. Progress was stopped in a great measure by appointment of officers for a limited period, the lack of security of tenure and of independent power of action, and the unfortunate tendency to appoint unqualified members of local authorities to important sanitary offices. He advocated the removal of power as regards sanitary matters from the hands of local authorities, to that of a central authority, which would have a Minister of Public Health

at its head. The Rhyl Sewage Works were then visited and drives to places of interest were made.

### MECHANICAL ENGINEERS' SUMMER MEETINGS.

The summer meeting of the Institution of Mechanical Engineers was begun last Tuesday week at Plymouth, and continued for the next three days, under the presidency of Sir William White, F.R.S. On Tuesday the members of the institution were welcomed to Plymouth by the Mayor, Alderman John Pethick, the Mayor of Devonport, Mr. William Hornbrook, and the chairman of the East Stonehouse Urban District Council, Mr. John E. Bone. The first paper on the programme was by Sir Frederick Bramwell, who described the South Devon Atmospheric Railway, which was laid down between Exeter and Newton in 1846, and was shortly after abandoned. He described Brunel's interesting experiments, and the other attempts to work railways on the atmospheric system, and said it seemed incredible to suppose that the valve on which the working of the railway depended could be made quite tight along its whole length. Mr. Pendred supplemented the paper by some recollections of the atmospheric system worked for very many years between Kingstown and Dalkey, suburbs of Dublin. Mr. H. R. Champness, Chief Constructor of the Royal Dockyard, Devonport, read a paper on the launch of a battleship, descriptive of the launching of H.M.S. Ocean. The last paper read at Tuesday's sitting was on "Railway Viaducts in Cornwall, Old and New," by Mr. T. H. Gibbons, engineer of the Great Western Railway. By means of diagrams and a model, he described the design and method of construction of the old Cornish viaducts, which formed so prominent a feature in the railway engineering of the west. One class of viaduct consisted of timber trusses to carry the decking and the railway, with timber piles to form the piers. Some of the creeks crossed have deposits of mud 70ft. deep, so that the piling for foundations is of a somewhat elaborate nature. The heights range from 40ft. to 100ft. The renewal of the timber trusses, an extremely difficult operation, has to be carried out about every twenty years. Another form of viaduct consists of timber struts radiating from the top of masonry piers. In this case renewals are more easily effected, it being possible to renew a strut in less than an hour. These timber constructions are apparently fast disappearing, the author saying that when the work now going on is finished there will only remain one timber viaduct between Truro and Penzance, and thus a picturesque and characteristic feature in connection with railway construction is disappearing on this line. Members of the Institution, after having lunched in the pavilion on the pier, embarked on a steamer for Devonport Dockyard, which was inspected under the guidance of the dockyard officers. On the Wednesday four papers were read and discussed. Mr. Whately Eliot, Admiralty superintending civil engineer at Keyham extension works, first read a paper on "The Mechanical Appliances Employed in the Construction of the Keyham Dockyard Extension Works." He pointed out how largely in important construction works machinery of every description was now superseding hand labour. The new works at Keyham occupied 113 acres, largely land reclaimed from the Tamar. The works comprised a tidal basin of ten acres, a closed basin of 35½ acres, besides large graving docks. The whole of the work was being carried out by contract undertaken by Sir John Jackson, of Westminster. Amongst the appliances described, the most interesting and novel were the scoops used for excavating soft mud, which was a more difficult material to deal with than might be thought. The scoops were dragged along the surface of the mud by chains, and were made to automatically tip the spoil into barges for carrying to sea. The way in which this was done was entirely novel and very ingenious. The next paper was by Mr. Robert Mayston, chief engineer of Her Majesty's dockyard, Devonport. He described the machinery of Her Majesty's ships *Proserpine* and *Psyche* as illustrative of the work

done at Keyham, particularly with reference to the practical training of the engineer students. Mr. Edward Sandeman, borough water engineer, Plymouth, then read a paper briefly describing the means that had been adopted for supplying Plymouth with water, the present works being, in fact, an enlargement and extension of those commenced in the year 1591 by Sir Francis Drake. The last paper read at the meeting was by Mr. Henry A. Garrett, borough engineer and surveyor at Torquay, the subject being "Refuse disposal and the result obtained from a six months' working of the refuse destructor at Torquay." The heat obtained from the burning of the town refuse was used for raising steam, and tests were quoted which showed that the destructor was capable of developing more power than was required for the machinery introduced in its original construction. An electrical installation was therefore adopted, and was now in course of construction, and will be used for lighting part of the street gas lamps. After a short discussion on this paper, the meeting was brought to a conclusion with votes of thanks to those who had taken part in the reception of the institution.

### THE HIGH-PRESSURE HEATING APPARATUS.

The newly-formed Institution of Heating and Ventilating Engineers held their summer outing at Stourbridge recently on the invitation of the president, Mr. Walter Jones, of the firm of Messrs. Jones and Attwood, of Titan Works, Stourbridge. The party visited the Titan Works and the Glass Works of Messrs. Thomas Webb and Sons, Ltd. A meeting was afterwards held at Stewponney Hotel, with Mr. Walter Jones in the chair, when a paper was read by Mr. A. E. Grindrod, of Messrs. Renton, Gibbs and Co., on "The Disfavour shown by Fire Insurance Companies to the High-pressure Heating Apparatus." He said that undoubtedly the greatest difficulty at the present time presenting itself to engineers fixing the high-pressure hot-water heating apparatus was the disfavour with which the fire insurance companies regarded the system. He was quite sure such an apparatus properly fixed was perfectly safe, and could not possibly be the direct cause of fires any more than other systems of heating. He had had a long experience with the system, and had never known such an apparatus to set fire to any building. Yet, unfortunately, for the last few years this disfavour of the fire offices had become more pronounced, and it was quite time that the subject should be thoroughly considered. He put the questions: What were the causes for this disfavour shown by the fire insurance companies? And, secondly, how was this disfavour to be removed? To the first question he answered that most certainly the principal cause was bad and incompetent workmanship. He came across much defective work, and had repeatedly to put right work done by firms who could not have given any study whatever to the system. He went into details on the question, and gave instances where the system had been condemned, when it was the workmanship which was at fault. As to his last question, he felt sure that their wisest and best course was to approach the Fire Insurance Tariff Committee in London, and lay their case before them, and get their view of the matter. He thought that it would be of great advantage in preventing incompetent workmanship if this Institution insisted upon members passing an examination, which would prove them competent to do their special work. This would be a stimulus to men to study their work, and membership would be considered an honour, work would be more intelligently done, and they would hear very much less of the disfavour shown by the fire insurance companies to the high-pressure hot-water heating apparatus. In the discussion which followed, Mr. W. R. Maguire (Dublin) said that he was engaged in the erection of a small bore apparatus as well as the erection of a low pressure apparatus, and hot-air apparatus, and he could instance a case in Dublin where a fire occurred, attributed

to but not caused by this apparatus. A building was erected in timber—a temporary building—and a contract was entered into amounting to about £500 for heating it with high pressure apparatus. The work had gone about half way through when the insurance companies combined, put their foot down and refused to insure the building. The result was the contractors and the company had to meet, and arrange for them to remove it. In its place hot-air apparatus was placed, which in his opinion was not so safe as the high pressure. They all knew that the hot-air apparatus became red hot, the flues became intensely hot, and there was a good deal of danger attached to that form of apparatus also. They knew very well what the insurance companies wanted; they wanted an apparatus, if they could get it, that would be perfectly safe. This they could not get, and then they would want an apparatus that would be the nearest to perfectly safe. Whether in town, where experts could be called in to meet difficulties, or in the country house, far away from experts, they wanted an apparatus to meet this; they wanted an apparatus that, in case of frost would be tolerably safe, and there would be no danger of pipes freezing up, and bursts occurring which would scatter the burnt fuel. Probably the burst would occur within the brick or metal boiler, and a fire occur in that case. Then the Companies wanted an apparatus which did not require an expert down to pump the apparatus full. They knew a low-pressure apparatus was safe, and there was not so much fear of frost, and further, there was no pumping required, and no great risk of explosion occurring. Several other members spoke in the discussion and in reply Mr. Grindrod said he did not wish to condemn the insurance companies for the manner in which they looked upon this work. They had found out that they had had to pay through high-pressure apparatus going wrong, before they condemned the system, but the faults lay more in neglect than in the system, and if the apparatus was properly fixed, from his experience—and he had had twenty years—he could tell them they were perfectly safe, and he had never known such an apparatus to set fire to any building. He thought if this class of apparatus was more carefully fixed, they would have no difficulty in getting the insurance companies to remove their restrictions, because it was only a matter of profit with them. A dinner was held in the evening, after which Mr. L. F. Pearson, managing director of the Beeston Foundry Company, Limited, Nottingham, read a paper on "Low-pressure water as a heating medium," but the discussion thereon was deferred until the next meeting, which is to be held at the Holborn Restaurant on October 5th.

**A Munificent Offer.**—At a meeting of the Bristol Town Council on Tuesday last week, it was stated that Sir William Henry Wills had offered to give £10,000 towards the erection of a Municipal Art Gallery building, on a site to be secured by the Corporation, near the Bristol Museum, Queen's Road, Clifton. The Council voted its grateful thanks to Sir William for his generous gift.

**Leeds Dead Meat Market**, which has just been erected in New York Street by the Leeds Corporation was formally opened last week. The market has been erected from designs by Messrs. Hanstock and Sons, of Leeds and Batley. The site contains 3,260 square yards, and it contains a market hall for sale of meat, a department for the Corporation officials, slaughter-houses and lairages for beasts and pigs, tripery, &c., and cold stores and chill rooms (in the basement). The wholesale meat market, which is the largest and most important of the departments, is 195ft. 4in. long, 45ft. wide, and its height is—to the eaves of the walls 25ft. 8in., and from floor to ridge 41ft. 6in. It is divided into twenty-two stalls, with centre avenue from end to end. The building has cost about £25,319 to erect, though in all a total of £40,860 has been expended.

## Professional Practice.

**Bilston.**—At the Staffordshire County Court an action was heard recently in which Mr. Richard James Rowe, Architect, of Bilston, sought to recover from Mr. Edwin Jones, of Mount Pleasant, Bilston, £62 14s. for architect's fees. Plaintiff said in January he received instructions from defendant to survey a piece of land in Wellington Road, Bilston, prepare plans for the erection of four houses, get out the quantities, and obtain tenders. The lowest tender was £2,090. Subsequently defendant decided not to build. For the defence, it was contended that the cost of the houses was not to exceed £1,600, and that defendant was only to charge four per cent. Judgment was given for the amount claimed, with costs.

**Clacton-on-Sea.**—It is proposed to extend Christ Church, Clacton-on-Sea, by the addition of a large school and lecture hall, seating about 400, with four large class rooms, which can be thrown into it. The scheme also pro-

submitted that no negligence on the part of his client had been shown. All he did was to give a rough idea of what the work would cost, without entering into anything like an elaborate estimate, and to some extent he was misled in his calculations by the plaintiff. The jury found for the plaintiff for £100 on his claim, and for the defendant on the counter claim.

**Exeter.**—The competition for a new Boys' School at St. Thomas, near Exeter, has resulted in the first premium being awarded to Messrs. McKewan and Dunn, of Birmingham, and the second premium to Messrs. Ayling and Hulbert, of Westminster. The plans were exhibited last week at the offices of the St. Thomas Urban District Council. The conditions of competition presented some curious and not very satisfactory features, on which we commented in our issue for April 26th. There were eighteen competitors.

**Folkestone.**—The new building specially designed and constructed on the East Cliff, Folkestone, for the carrying on of the work of

The site has a frontage of 73ft. 4in. to Marsh Street and 63ft. 9in. to Mill Street, and on this the company have already commenced operations. The premises will consist of a four-storied building, and will be erected in the Renaissance style. In the semi-basement will be located the stores. The underground cables will be led in from the streets on this level and carried past the various floors to the test and switch rooms above by means of a cable shaft specially constructed for their reception. The main entrance will be from the Trinity Street front and will be a recessed porch doorway leading to the vestibule; the latter will open into a road corridor. The corridor then widens into a large hall, on the right of which will be the main staircase leading to the floors above. On the left will be the call offices for use by the public. The first floor will cover accommodation for the inspector's staff in three large rooms. The caretaker's living rooms will also be situated on the Mill Street wing of this floor. On the second or top floor will be the switch-room. This will be the most important room in the building, and has been specially designed for its purpose. It will occupy the entire length of the Marsh Street

PROPOSED EXTENSION TO CHRIST CHURCH, CLACTON-ON-SEA. T. H. BAKER, ARCHITECT.

vides for the extension of the church, and the provision of a much-needed organ. The existing church was built in 1887, from the plans of Mr. T. H. Baker, architect, of Clacton and Colchester, whose design was selected in competition, and he will be employed for carrying out the proposed extension, of which we give an illustration on this page. The church, which at present seats just over 400, is built of Luton bricks and Bath stone dressings, and is in the Early English Gothic style. The estimated cost of the additions is £2,500.

**Driffeld.**—At the Yorkshire Assizes, at York Castle, recently, Mr. Justice Grantham and a special jury heard an action in which Mr. Daniel Byass, maltster and corn merchant, Driffeld, sued Mr. Richard Hardy, architect, of Nottingham, for damages arising from negligence on the part of the defendant in the reconstruction of malt kilns at Driffeld. The claim was for £226, the difference between £150, the amount for which the defendant undertook to reconstruct a malt kiln, and £376, the amount actually paid by the plaintiff for the work done. The defendant put in a counter claim for £44 9s. 4d. for services rendered to the plaintiff. For the defence it was

Mrs. Mearn's Convalescent Home, was duly dedicated and opened last Tuesday week. The ceremony of opening was presided over by the Mayor of Folkestone, Alderman Salter, J.P., who was assisted by Sir Edward Sassoon, M.P. The building consists of three floors, enclosed with hollow walls faced with red brick, all dressings, strings, and baluster columns being of buff terra-cotta by Messrs. Stiff, of Lambeth. The floors are fireproof. The walls of the lavatories, bathroom, w.c.'s, kitchen, and other offices are lined with Newellite tiles. The building is heated throughout by a low-pressure hot-water system, carried out by Messrs. Rosser and Russell; and the lighting throughout is by electricity installed by Messrs. Bergtherl and Young. The bedroom accommodation is designed so that each patient has a separate or private cubicle. The architect is Mr. W. A. Hughes, of 3, Dean Yard, Westminster, and the builders are Messrs. T. W. Gregory and Company, of Station Works, Clapham Junction, S.W.

**Hanley.**—The National Telephone Company are having a new exchange erected in Trinity Street, and a site has been purchased at the corner of Marsh Street and Mill Street.

side, a distance of 68ft., and will be 31ft. wide with an open roof having a top lantern light for a greater portion of its length, in addition to the usual windows. The architects are Messrs. B. Scrivener and Sons, of Hanley, and the builders are Messrs. Tompkinson and Bettelley, of Longton.

**Shrewsbury.**—At the Staffordshire County Court an action was recently heard in which Messrs. Manton and Sons, architects, Wolverhampton, sought to recover £21 17s. from Trouncer and Co., brewers, of Shrewsbury, and Mr. Burdass, a member of the firm, for fees for the preparation of plans and other work. The plaintiffs' case was that they received instructions from Mr. Burdass to prepare the plans and specifications for alterations in connection with the Onward Club at Compton, at 5 per cent. After the work had been completed the alterations were not proceeded with, and a dispute arose as to the amount to be paid. Defendants had paid £10 18s. 6d. into court, as a fair sum. The defence was that the plaintiffs had exceeded instructions. His Honour considered the amount paid into court sufficient, and gave judgment for the defendants.

## Trade and Craft.

### CAILLET'S MONORAIL.

We have received from the Monorail Portable Railway Co. Ltd., of 22, Laurence Pountney Lane, London, E.C., a book of over fifty pages, which describes the Caillet monorail system of transportation. It contains illustrations of its practical use in various countries. The system consists of a single rail of light section supported by steel sole plates at intervals of a few feet which are laid down direct on the surface of the ground without sleepers, ballasting, or other special preparation. The rails are joined together by scabbard fish-plates, which fit the lower part of the rail and are slid along so as to form the joints, thus obviating any necessity for boring holes in the rails. The line is constructed with ease and rapidity, and can be used immediately after being laid down. The rolling stock comprises cars for hand traction and trucks for animal traction. The cars can be obtained in various sizes and shapes, according to the use for which they are intended. The car runs on two wheels of the same size, one being placed before and the other behind the car. The hand car is put in motion and balanced on the rail by means of a lever in the form of a rod, which projects from the back line of the car at right angles to the line of the rail. This rod is adjustable, and can be lengthened to suit convenience. Assuming that the car is so loaded that its balance is nearly exact, it is plain that very little exertion is required for propulsion. In fact the act of propulsion maintains the equilibrium of the car without any special effort. One of the advantages of the system is the fact that it provides a uniform and continuous surface, preventing the jolting and jarring which result from traction over uneven roads or tracks, and it is, therefore, suitable for transporting fragile and heavy loads. The cars and trucks cannot be upset. Caillet's monorail is very portable, and can be constructed and repaired very easily. The firm state that they will be pleased to send estimates for fully-equipped lines, suitable for any specified class of transport or traffic, on application.

### HENDRY & PATTISSON, LIMITED.

We have just received copies of the catalogues of casements and art metal work, and of heating and ventilating appliances, made by Messrs. Hendry and Pattisson, Ltd., of 4, Marlborough Mews, Hill's Place, Oxford Street, London, W. The company incorporated the late firms of Mr. D. O. Boyd, and Messrs. E. Farrar and Co., the original makers of "Farrar's" well-known casements. All "Farrar's" casements are hung on steel pivots, with strong gun metal bearings, to prevent any dropping of the opening frame, and, when required, are fitted with a condensation cill. This cill, which is fitted with an arrangement whereby all moisture settling on the inside is carried outside, provides a great advantage in a humid climate like that of England. Many objections have been raised to the usual form of sash hung upon pulleys, lines and weights, and for many reasons casements are desirable. The advantages of windows which can be easily opened in weather such as we have lately been experiencing cannot be gainsaid. The strongest objection against the ordinary casement is that in wet weather it is not watertight, and especially does this objection apply in buildings exposed to the force of the wind. This disadvantage is overcome in casements made by Messrs. Hendry and Pattisson, and these at the same time can be had to open both inwards and outwards. Another advantage they possess is that the glass can be cleaned from the room. The parts are so simple that they cannot get out of order. The casements are made in either bronze, steel, or wrought iron. Although Messrs. Hendry and Pattisson have such excellent goods in the shape of casements, they study the wishes of customers who like the ordinary form of double hung sash in providing a reversible window sash,

which meets the one great objection to this form of window, in the ease with which the windows can be cleaned. The top one can easily be arranged to admit an ascending current of air in rainy weather, yet keeping out the rain. Both sashes can be fixed at any angle, and can be so arranged as to leave nearly the whole space of the frame open for getting in furniture, &c. The sashes can be adapted to suit any old frames. In the same catalogue we note several designs for artistic wrought iron work, which is at the present moment in such great demand. The firm carries out this art metal work from architects' own designs. Another speciality of this firm is D. O. Boyd's patent ventilating grates and stoves, which are made in a number of patterns and shapes to suit any room in an ordinary house. They are specially suitable for heating large rooms effectively, such as hospital wards, workhouses, schools, libraries, public halls, and churches. The upper part of these stoves has an arrangement which enables fresh, cool air to enter from the outside of the building in summer when fires are not alight; in winter the air can be warmed to any desired temperature, and is not burnt in so doing. The air supply can be regulated as required. The stoves can be fixed in the centre of a ward, the products of combustion being carried off by a descending flue underneath the floor. Percival's Patent Automatic Acetylene Gas Generator is solely manufactured by this firm. This new illuminant is increasing in use, as it has been proved to be less poisonous than coal gas, and the light given by it is about sixteen times more than that of coal gas. Percival's Generator gives a steady, cool, and brilliant light, and is so simple, that it can be managed by any domestic servant. The generator is perfectly safe, the gas being only under a pressure of about one-eighth of the maximum allowed by the authorities. It can be recharged while in action, and without variation of the pressure, thus enabling a constant supply of gas to be kept up.

## New Companies.

### Jarrah Timber and Wood Paving Corporation Limited.

An issue is announced this week of £100,000 First Mortgage Debentures of this company. The stock is issued at par and will bear interest at five per cent. The object of the issue is to acquire and develop 25,000 acres of the Downer Estate, which formerly intersected the eastern and western sections of the original property of the company. This issue of debenture stock will be secured by a specific first mortgage to the trustees for the debenture stockholders of the whole of the Corporation's freehold lands, buildings, sawmills, railways and tramways in Western Australia, and by a floating charge on the stocks of timber at the mills and in transit, locomotives, rolling stock and other assets, so that the issue seems fully secured both as regards capital and interest. Further particulars of the issue will be found in our advertisement pages.

### Weybridge Furnishing Company Ltd.

This company was registered on July 20th, by Scatliff and Gray, 6, Lancaster Place, W.C., with a capital of £6,000 in £1 shares, to acquire and carry on the business of builders, electric and sanitary engineers, &c., carried on at Queen's Road, Weybridge, as the Weybridge Furnishing Company. The first directors (to number not less than three nor more than five) are E. L. Shaw, C. H. Eray, H. Wilson, F. H. Weller, C. O. Wallasey, C. Snook, and J. Cave. Qualification, one share. Remuneration, £5 each per annum.

### Saxon Portland Cement Company, Ltd.

This company was registered on July 19, by Waterlow Brothers and Layton, Limited, Birch Lane, E.C., with a capital of £40,000 in £1 shares (20,000 preference), to carry on at Cherryinton, near Cambridge, and elsewhere, the business of Portland cement manufac-

turers, stone and tile merchants, &c., and to adopt two agreements with G. Keeble, A. J. Keeble, and G. H. Innes. The first directors (to number not less than three nor more than seven) are G. Keeble, A. J. Keeble, G. H. Innes, A. C. Davis, and A. Durose. Qualification, £250. Remuneration as fixed by the company.

### Bargoed Artizans' Cottage Company, Ltd.

This company was registered on July 21, by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £7,000 in £10 shares, to acquire or construct houses, buildings, roads, &c., in England or Wales. Registered without articles of association. Registered office: Firwd Villa, Mountain Ash, Glamorgan.

### Smokeless Chimney Company, Limited.

This company was registered on July 21st, by Jordan and Sons, Limited, 120, Chancery Lane, W.C., with a capital of £30,000 in £1 shares, to acquire from Thomas Lowe, of Nottingham, and all others having any claim therein, Patent No. 22,614 of 1897, to adopt an agreement between Thomas Lowe, of Nottingham, of the first part, W. C. Courts, of Nottingham, of the second part, John O. Earp, of Matlock, Derby, of the third part, Joseph C. Brister, of Manchester, of the fourth part, and the company of the fifth part, and to carry on the business of agents, engineers, &c. Registered without articles of association.

### North Riding Assets Co. Limited.

This company was registered on July 18th, by Adam, Burn, and Son, 6, Bell Yard, Doctors' Commons, E.C., with a capital of £20,000 in £1 shares, to acquire, develop, and turn to account and deal with real and personal property of all kinds, and in particular lands and buildings, hereditaments, goods, merchandise, plant, machinery, stock-in-trade, produce, works, concerns and undertakings. The number of directors (to number not less than three nor more than seven) are George Bradford, William H. Hardy, Gervase E. Markham, Hermann Ronnebeck, and Francis T. Tristram. Qualification, £300. Remuneration as fixed by the company. Registered office, Post Office Chambers, Marton Road, Middlesborough.

### Brushes, Limited.

This company was registered July 20th, by Waterlow Brothers and Layton, Limited, Birch Lane, E.C., with a capital of £100,000 in £1 shares, to adopt and carry into effect two several agreements, each bearing date July 8th, 1899, and expressed to be made between Thomas Shaw and Sons, Limited, of the one part H. Wilde of the second part, and H. W. Rose and G. Rose of the third part, for the acquisition, by purchase or otherwise, as a going concern, of the business now and hitherto carried on under the style or firm of Thomas Shaw and Sons, Limited, at Warre Street, Ashton-under-Lyne, and Miller Street, Manchester; a similar business carried on by H. Wilde as J. Wilde and Son at Oldham, and the brush manufacturing business carried on by H. W. and G. Rose at St. Albans, Herts, under the style of H. Rose and Sons, to develop and extend the said business, and, generally, to carry on in all or any of their respective branches the business of brush manufacturers, and as importers and exporters of and dealers in all materials used in connection with the above, together with any plant, apparatus, or machinery necessary or convenient therefor; to acquire, for the purposes of the company or otherwise, any lands, buildings, factories, warehouses, turning engines, &c.; to acquire and turn to account any patents, patent rights, and inventions; as stock and share dealers, bill brokers, &c. The first signatures (each one share) are: J. B. Grundy, T. Shaw, H. Wilde, W. Rose, J. G. Wilde, G. Rose, and H. Rose. The first directors (of whom there shall be not less than five nor more than seven) are the first signatories to the memorandum of association. Qualification, £500. Remuneration to be fixed by the company.

**Times Nut and Bolt Works, Limited.**

This company was registered on July 21, by Waterlow Brother and Layton, Limited, Birchin-lane, E.C., with a capital of £20,000 in £1 shares. Object to adopt an agreement with T. M. Anderson and F. A. Murphy, and to carry on the business of nut, bolt, and machine tool makers, engineers, &c. The first directors (to number not less than three nor more than seven) are to be appointed by the subscribers. Qualification, £200. Remuneration as fixed by the company.

**Robert Stephenson and Co., Limited.**

This company was registered July 19th, by W. A. Crump and Son, 10, Philpot Lane, E.C., with a capital of £500,000 in £10 shares, to adopt and carry into effect an agreement expressed to be made between Sir J. Whitwell Pease, Bart, M.P., Sir C. Furness, and Sir R. Dixon of the one part and this company of the other part, for the acquisition of certain businesses mentioned in the said agreement, and to develop and turn to account the same in such manner as the company shall see fit; and, generally, to carry on in all or any of their respective branches the businesses of mechanical, marine, and electrical engineers, engine repairers, ship builders and repairers, shipowners, carriers by land and sea of passengers, goods, mails, troops, &c.; as colliery proprietors, coal merchants, ironfounders, steel converters, producers and suppliers of gas, coke manufacturers, cement makers, brick and tile manufacturers, makers of ropes, masts, spars, &c.; as sawmill proprietors and timber merchants, builders and contractors, farmers and graziers, stock raisers, ice merchants, refrigerating storekeepers, warehousemen, wharfingers, to construct and maintain rail and tram roads, as dealers in live and dead stock, grain, &c.; to acquire and turn to account any patents, patent rights, real and personal property, &c., in any part of the world. The first signatories (each one share) are Messrs. W. C. Warwick, P. A. Heitland, G. P. Carpenter, W. J. Fox, W. G. J. Copeman, W. R. Barr, and W. Leaver. The first directors (of whom there are to be not less than five nor more than seven) are Sir R. W. Pease, Sir R. Dixon, Sir C. Furness, J. A. Pease, Lieut.-Colonel P. Watts, and H. Withy. Qualification, £2,000. Remuneration, £2,000, divisible, per annum. Registered office: South Street, Newcastle-on-Tyne.

**Joseph Nathan and Co., Limited.**

This company was registered July 19th, by

Hollams and Co., 30, Mincing Lane, E.C., with a capital of £127,000 in £100 shares, to adopt and carry into effect a certain agreement for the acquisition, by purchase or otherwise, as a going concern, of the business of dealers in wool and other produce, as now and hitherto carried on under the style or firm of Joseph Nathan and Co., at 17, Fenchurch Street, E.C., and Wellington, New Zealand, the said agreement expressed to be made between J. E. Nathan, D. J. Nathan, and L. J. Nathan of the one part and this company of the other part; to develop and extend the same, and, generally, to carry on in all or any of their respective branches the business of wool brokers, commission agents, importers and exporters, refrigerating store keepers, shippers, shipowners, carriers by land and sea, forwarding agents, farmers and graziers, stock-raisers, cattle dealers, extract of meat manufacturers, preservers and packers of provisions of every description; colliery owners and coal merchants, brewers and maltsters, wine and spirit merchants, miners, smelters, and metallurgists; as manufacturers of artificial manures, tallow manufacturers; as mechanical electrical, and general engineers, ironfounders, ironmasters, steel converters, carpenters, wood workers, &c.; to acquire and turn to account any real or personal property, patents, patent rights, mines, grants, leases, claims, concessions, &c., in any part of the world. The signatories (each one share) are Messrs. J. E., D. J., L. J., M. J., P. J., and C. J. Nathan and H. Isaacs. The first directors (of whom there shall be not less than two nor more than seven) are J. E., D. J., L. J., and M. J. Nathan. Qualification of the first directors, £3,000; of ordinary directors, £1,000. Remuneration of the above-named as managing director, £1,900 per annum and a percentage of the profits; remuneration of ordinary directors to be fixed by the company.

**The Death of Sir Henry Dryden, Bart.,** occurred at his residence, Canons-Ashby Hall, Northamptonshire, last Monday week. Sir Henry was a well-known antiquary, and wrote a large number of papers and articles for the Scottish Society of Antiquaries, the Scottish Architectural Society, and the Northampton and local archaeological societies and their publications. Last year he presented to the Corporation of Northampton his large collection of drawings, plans, and rubbings that he had collected in Northamptonshire during the last sixty years; these were contained in more than 500 portfolios.

## DEBENTURE PROSPECTUS.

This Corporation was formed in March, 1898, for the purpose of engaging in the West Australian timber trade, and since that date the Directors have been actively engaged in developing the property and business of the Corporation, devoting their attention specially to the property originally acquired by the Corporation in the Collie district, where two additional mills, furnished with the most modern machinery, have recently been erected. This policy has been pursued by the Directors in view of the superiority of the Jarrah timber in that district, of its proximity to the port of shipment, and of the facilities afforded by the Government railway. Hitherto, however, economical working has been to some extent interfered with owing to the fact that the Eastern and Western sections of the property are divided by a tract of freehold Jarrah forest, 29,986 acres in extent, known as the Downer Estate.

It is claimed that the Downer Estate is absolutely unique among Jarrah forests by reason of the magnificence of its timber, its density, its accessibility, and the fact that it is freehold. It is, and has been for many years past, the settled policy of the West Australian Government not to part with the freehold of its forest lands, and the freehold estates created under an earlier régime have become increasingly valuable. Sir WILLIAM INGRAM, Bart., one of the largest Shareholders, appreciating the enormous value of this property to the Corporation, recently acquired it, and, under Contract dated July 10th, 1899, has agreed to sell 25,000 acres thereof to the Corporation, and to accept payment of the purchase price of £60,000 wholly in Debenture Stock of this issue at par in certain eventualities detailed below. He has further agreed to accept a seat on the Board of Directors on completion of the said Contract. It will be seen on reference to the sketch map which accompanies this Prospectus that the Collie Coalfields (Government) Railway runs through the centre of the Estate, and that the acquisition of 25,000 acres of the property will consolidate the Eastern and Western sections of the Collie Estate into a homogeneous whole, the Corporation thus owning practically in one block no less than 30,100 acres (over 47 square miles) of freehold timber lands, apart from all its other valuable assets.

Mr. NEWTON J. MOORE, of Bunbury, W.A., an eminent authority on forest lands and their values, describes the Jarrah Timber in the Collie District as "the best Jarrah in the Colony," and reports as follows in reference to the Downer Estate:—

BUNBURY, WESTERN AUSTRALIA, 5th May, 1899.

The Directors,

JARRAH TIMBER AND WOOD PAVING CORPORATION, LIMITED,  
BROAD STREET HOUSE,  
LONDON, E.C.

GENTLEMEN,

I have the honour, acting on instructions from Mr. J. C. PORT, your General Manager in Western Australia, to report on the property known locally as "Downers," consisting of three distinct blocks situate in the Collie District, and which I shall call herein:—(1) "A," being portion of Wellington Location No. 1, consisting of 3,842 acres; (2) "B," being portion of Wellington Location No. 51, 12,489 acres; (3) "C," Wellington Location No. 56, containing 13,655 acres. (The property in the aggregate totalling 29,986 acres, but from this must be deducted about 400 acres resumed by the Government for Railway and Road purposes).

2. For the purposes of this report, I forward herewith a map of the District on which I have coloured:—(1) Red, the properties above referred to; (2) Blue, the Freehold and Conditional Purchase Blocks held by your Company, and (3) Yellow, the Timber Leases in your name.

3. I must first direct your attention to the immense advantage the acquisition of this property will be to your Company by placing your interests in concrete form in one block, and thus doing away with the very vexed question of "overlapping boundaries." You would possess a monopoly of the timber lands between the Collie and Brunswick Rivers connecting with Millars Karri and Jarrah Forests, Limited, property on the North, and the Collie Coalfields Mineral area on the east, whilst you would obtain ten miles double railway frontage through a virgin forest.

4. I consider "Block A" as a timber property the finest selection in the Colony. It carries 50 loads per acre of sound, well-grown, matured Jarrah Timber, aggregating 190,000 loads in the round. It offers you the great advantage of being easy to work from No. 1 Mill. "Block B" carries an average of 25 loads per acre, aggregating 300,000 loads of equally as good timber as "A." Its loss in carrying capabilities as against "A," being in a measure marred by river and creeks. However, it has an advantage over "A" in railway frontage (5 miles), along which the timber growth is heavy. Its northern boundary, as previously stated, adjoins Millars Karri and Jarrah Forests, Limited. Your Worsley [or No. 2] Mill controls this block. "Block C" will yield an average of 20 loads, or 270,000 loads of good Jarrah timber, as well as a large quantity of Black-Butt, and it includes some really

fine Agricultural Land in close proximity to a railway connecting with the Markets. The Jarrah in this block has the best growth along the railway line, and thus is very easy of access. The Three Blocks will yield approximately three-quarters of a million loads of good sound Jarrah in the round.

5. The land comprised in the three blocks was acquired in the early days of the Colony, when the whole of the country was open for selection. It has since been regarded as the pick of the timber country in the South-west, and in consequence of having been strictly preserved, it is now in its virgin state. In fact, it includes not only the largest area of freehold timber country in the district, but has the finest growth of Jarrah we can show. Apart from the timber there is a considerable area of really first-class Agricultural Land on the property, especially in the neighbourhood of the Hamilton River, and this being as shown, near to a railway, and also adjacent to the Collie Coalfields, would if now thrown open bring a good price.

6. Concisely, by acquiring "Downer's" property, your Company

- (1) Would secure a monopoly of the timber on the Collie Ranges;
- (2) Would secure ten miles frontage to the Collie Railway;
- (3) Would add years to the life of your present Mills;
- (4) Would be in a position to conserve the young growth so as to secure a continuous and inexhaustible supply of timber and
- (5) Would place you in the unique position of being permanently fixed within a reasonable distance of the shipping port of Bunbury on the one hand, and the Collie Coalfields on the other.

I have the honour to be, gentlemen, your obedient Servant,  
NEWTON J. MOORE, L.S., &c., &c.

The proceeds of the present issue of Debenture Stock will be applied as follows:—The first £20,000 towards further working Capital, the next £20,000 towards the purchase price of the property, and the balance, as to one-third in providing further working Capital, and as to two-thirds in further part payment of the purchase price of the property, and in so far as the proceeds of this issue may be insufficient to provide the purchase price in cash, Sir William Ingram has agreed to accept payment in the said Debenture Stock at par.

The present issue of Debenture Stock will be secured by a specific First Mortgage to the Trustees for the Debenture Stockholders of the freehold property now being acquired, and of the whole of the Corporation's other freehold lands and timber yards, buildings, saw-mills, railways and tramways, and also by a floating charge on all the other assets of the Corporation, including forest lands held under special licence from the Government of Western Australia, leasehold timber yards in the City of Perth, W.A., stocks of timber at the mills and in transit, locomotives, rolling stock, loose plant, book debts, and goodwill.

By the present issue the working capital of the Corporation is increased to £73,000, and its profit earning capacity largely augmented. Apart, however, from this consideration, it will readily be seen that the security for the Debenture Stock now offered for subscription is of the most ample character. As the freeholder of a vast tract of densely timbered country, the Corporation will be in a position to adopt the most approved methods of forest conservation, and to secure a continuous and inexhaustible supply of Jarrah of the finest quality. The necessity of establishing a sinking fund being thus obviated, the service of the Debenture debt will only involve an addition of £5,000 to the annual charges of the Corporation.

The Corporation continues to secure a full and satisfactory proportion of the business now offering. All timber, arrived and to arrive, has been sold: orders are now on hand for upwards of two millions of paving-blocks; and negotiations with numerous Municipal authorities and public bodies are in progress for further large contracts.

Application will be made in due course for a Stock Exchange settlement and quotation.

Copies of the Memorandum and Articles of Association of the Corporation, and of the Debenture Stock Certificate, and draft of the Trust Deed securing the Debenture Stock, can be seen at the office of the Solicitor to the Corporation.

In the event of no allotment being made, the deposit will be returned in full, and where the amount of Stock allotted is less than that applied for the available balance will be appropriated towards the payment due on allotment or subsequent instalments, and any excess will be returned to the applicant. Any amount repayable will be sent to the applicant by cheque through the post at the applicant's risk. Failure to pay any instalment when due will render the allotment liable to cancellation and previous payments liable to forfeiture.

Prospectuses with forms of application can be obtained at the offices of the Corporation, or at those of its Bankers, Brokers, or Solicitor.

July 29th 1899.

## COMPETITION.

### NORTHFLEET SCHOOL BOARD. TO ARCHITECTS.

The Board invite PLANS for the ERECTION of SCHOOLS to accommodate 750 children; 500 mixed, 250 infants.

The architect whose plans are selected will be required to prepare detailed specification, and the plans and specification are to be subject to the approval of the Education Department.

A fee of £15 15s. will be paid to the candidate whose plans are selected which shall be the absolute property of the Board.

Plans to be sent in not later than MONDAY, SEPTEMBER 4th.

The name of the architect is not to be placed on the design, but simply a non-de-plume, a copy of which should be placed in an envelope securely sealed and sent direct to me.

Further particulars of site and class of building required may be obtained on personal application to me.

FREDERICK MITCHELL,  
No. 49, Windmill-street, Clerk to the Board.  
Gravesend,  
July 26th, 1899.

FIG. 1.—SECTION OF A WALL SLAB.

## A NEW FIRE-RESISTING MATERIAL.

MR. WILLIAM MILLAR (author of "Plastering Plain and Decorative") has recently invented a new kind of plaster slab called "Petrura," which is claimed to be practically fire-proof, sound-proof, and damp-proof, besides being cheap and durable, simple of manufacture and easily fixed. A short description of these slabs may be of interest. The Petrura plaster slab is prepared from a basis of gypsum with which hydraulic lime and certain chemicals are scientifically incorporated. The plaster is gauged with a chemical liquid which hardens it, and renders it more incombustible. In the process of manufacture the slabs are cast with grooved edges, rebated joints, and counter-sunk perforations in one operation. Petrura slabs being made with a finished face, no setting coat is required, and except for stopping the joints, no plastering is needed. The slabs contain no canvas or wood (both inflammable materials used in fibrous plaster slabs), and being of a thicker substance, they are obviously superior in many points to fibrous plaster work in general. The slabs are easily fixed with screws, and counter-sunk perforations are made to receive the screws. Ceiling slabs have counter-sunk perforations on the rebated-sunk joints, so that when the perforations and joints are stopped the screw heads are doubly protected from fire and damp. The slabs are constructed in various forms. There are wall slabs with keyed backs, a section of which is shown in Fig. 1, ceiling slabs, casing and lining slabs, and slabs for decorative purposes.

If the slabs are fixed on brick, stone, or concrete walls the bottom row is first fixed with screws, and then liquid Petrura grout is run into the keyed back, thus forming the whole into a solid and compact body. Fig. 2 shows a portion of a wall slab so fixed, the dotted line indicating the keyed back. The figure also shows a section of skirting slab. These skirting slabs may be used in place of wood skirtings. They are made in various lengths

and are plain, or may be moulded to any design. In the ceiling slabs there is a rebated or sunk joint on all face edges, and on this sunk surface counter-sunk perforations for fixing screws are formed, the screw heads being protected from the effects of fire by stopping the sunk joints.

Withstanding both the action of fire and water, these slabs, as was shown at a recent fire test, are well adapted for casing iron or wood beams, girders, and columns as a protection; and a combination of the Petrura slabs and other materials form what is known as the A Z fireproof floors, sections of which are shown in Figures 3 and 4. This floor with iron joists is formed by first fixing the Petrura ceiling slabs on the flanges of the joist, and fixing next the Petrura centreing slabs; the rough concrete is laid, the sliding pieces are inserted, and the joists stopped, thus finishing the work. If wood joists are used, the narrow Petrura lining slabs are fixed on the lower sides of the joists, and then the centreing slabs are laid in position, after which the lining slabs are fixed on the upper sides of the joists. The rough concrete is next laid, and Petrura ceiling slabs are then fixed.

From their composition these floors are hollow and light, and it is claimed that they are fireproof, sound-proof, and vermin-proof. By them a perfect system of ventilation is provided, and channels for electric bells, tubes or wires can be readily formed. Both the Petrura slabs and the materials for the A Z fireproof floors are manufactured by the London Portland Cement Company, Ltd., of 123, Bishopsgate Street, Within, E.C., and at the present time, when there is a keen demand for materials with the qualities claimed for these products, they are likely to be widely used.

**East Dereham Carpenters and Joiners** have received an advance of a penny per hour. A meeting of the men was held recently, at which a resolution was unanimously passed to ask for the advance. A round robin which was sent to the building trades was favourably considered by them, and in each case the advance has been granted. The increase brings the wages up to 6d. per hour.

## SEWER VENTILATION.\*

By J. MORGAN.

ANY new theory advanced or practical suggestion made, with the object of improving the system or systems in vogue for the ventilation of sewers, will, the author feels sure, receive from every municipal engineer and surveyor that consideration which the importance of the question demands.

It will not be necessary to enumerate here the various gases generated in sewers by the

FIG. 2.—SECTION OF A SKIRTING SLAB.

putrefaction of sewage matter. For the purpose of this paper it will be sufficient to classify them under two heads—viz. (1) heavy gas, and (2) light gas.

The heavy gas, being weightier than the atmosphere, rests on the surfaces of the

\* A paper read at the annual meeting of the Incorporated Association of Municipal and County Engineers, held at Cardiff, June 29th and 30th, and July 1st, 1899.

FIG. 3.—SECTION OF IRON JOIST.

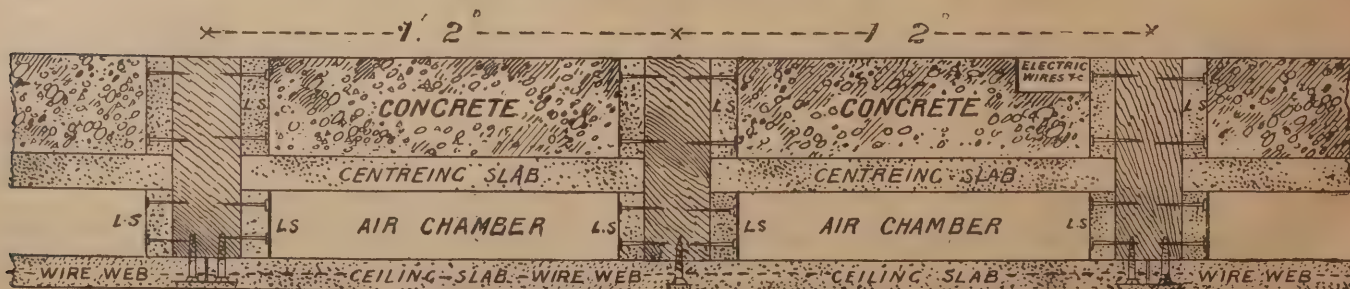

FIG. 4.—SECTION OF WOOD JOIST.

sewage, and, owing to the friction caused thereby, a large percentage is rolled along with the flow towards the outfall, while the remainder is either diffused by the air or dissolved by the liquid.

The other gas, which is lighter than air, presses against the soffit of the sewer, and, when the sewage increases in volume, this gas is also rolled with the flow in the manner already described. As, however, the flushing is intermittent, the light gas will often ascend along the crown of the sewer to the nearest ventilator, where it will create a nuisance—especially in the case of a service ventilator—if not previously diluted with sufficient air. Where an ordinary iron pipe forms the outlet, the current is greatly retarded, if not quite overcome, during hot weather by the friction resulting from the expansion of the sewer air within the heated vent-pipe. Consequently, surveyors often find that the longer the vent-tube is the less effective it proves under the condition named.

Under the old system air rarely enters a sewer to create a draught, except immediately after it has been flushed, when it will rush in to fill the partial vacuum caused by the displacement of the gas, and when strong currents of wind blow over the ventilator.

The shaft outlet system, with the surface ventilators closed—excepting a few which are used as air inlets—is no doubt an improvement upon the old method in its present form, but it is defective in many respects, of which the following may be mentioned: (1) The uncertainty, and therefore the irregularity, in the action of the air inlets, inasmuch as they also act as outlets under certain conditions, especially during flushing operations. (2) When a group of two or more outlet pipes are fixed on either side of an inlet, each with a sectional area in excess of the said inlet, as advocated by those who adopt this system, it is evident that all the air that enters the sewer will pass up the nearest vent-pipe, leaving the portion of the sewer extending to the furthest outlet in the group unventilated. (3) The vent-pipe, as already explained, becomes inoperative during hot weather, which is the most critical period the surveyor has to contend with in the discharge of this branch of his duties.

It is therefore necessary, in order to properly ventilate sewers—especially those which have to be frequently entered for cleansing purposes, &c.—that they should be regularly supplied with sufficient air to diffuse and dilute the gases ere they reach the surface or shaft ventilators; and the efficiency of a system of ventilation depends to a great extent upon the relative positions and sectional areas of the several groups of air inlets and outlets.

Having thus briefly reviewed the existing systems, I will now proceed to explain what I make bold to describe as my improved method of ventilating sewers.

The chief feature is the arrangement of a passage through which air may enter the sewer, while it will be impossible for gas to escape into the atmosphere through the same channel.

This automatic air inlet may be briefly described as follows: A grooved flange is arranged at the bottom of the frame which supports the manhole grating. In this flange a hole is formed to receive a pipe which is firmly and tightly fixed therein. This pipe, which may be 3in. or 4in. in diameter, extends into the manhole to a point which will be level with one-third of the diameter or depth of the sewer. The groove in the flange is filled with fine sand, on which the corresponding rim of the upper end of the dirt box rests, thus rendering it air-tight. The air inlet arrangement is fitted at every alternate manhole, leaving the intermediates to act as surface outlets, if not substituted by shaft outlets. It may be well to mention here, that I consider it an indispensable condition, that one outlet only shall be placed on either side of an inlet, and that the distance between them shall not exceed 100 yards, and at as equal distances as circumstances will permit.

I have already mentioned the defects, in my opinion, of a shaft outlet with a uniform

sectional area throughout. This plan of outlet should be modified in the following respects, viz.: The pipe should taper from 6in. at the closed manhole, or at a more convenient junction with the sewer, as the case may be, to 4in. at a combined junction and rust pocket fixed at the base of the upright shaft attached, for instance, to the gable of a house. The vertical portion of the shaft should taper in the inverse ratio, that is to say, from 6in. near the top to 4in. at the surface line. In order, however, to lessen the atmospheric pressure on the column of air in the pipe, the top end should be bevelled so as to reduce it to the same sectional area as that at the base. The temperature of the sewer air is considerably lower than the outer air during the summer months. The quantity passing through the shaft will be regulated by the reduced area at the base of the upright, so that during hot weather it will have room to expand in its upward and quickened progress through the enlarged and heated vertical shaft, thus reducing the friction to a minimum.

On the other hand, during the winter months, this form of outlet shaft will be advantageous, inasmuch as the sewer air, with a higher temperature than the atmosphere, will obtain a passage through it almost free of friction.

The conjoint action of the inlet and the outlet on either side will ensure a regular current of fresh air passing into the sewer, to diffuse and dilute the gas before it passes out at the nearest shaft or grating. For instance, when the sewer runs from one third to two-thirds full, with the sewer air travelling in the same direction as the flow, an induced current of fresh air will pass over the air-tight dirt box and through the inlet pipe into the sewer. When the sewer is more than two-thirds full, the inlet pipe becomes submerged and therefore inoperative; but when this point is reached, the gas will have been completely diffused by the air or absorbed by the liquid, and under this condition of the flow no putrefaction can take place to form additional gas.

During the time that the sewage runs low, natural ventilation will set in between the inlet at the lower and the outlet at the higher level.

As the atmospheric pressure on an inlet and surface outlet connected with a sewer having a flat gradient is practically equal, the ventilation is neutralised. In such cases, I would recommend that the surface ventilator be closed, and a shaft substituted. Surface outlets will, however, in my opinion, suffice for gradients which may be steeper than say 1 in 150.

The advantages claimed for this system of ventilation are: (1) The inlet is automatic in its action. (2) Each section of the sewer is aerated independently. (3) No gas can escape through the inlet, as it will pass up or down the sewer, above the level of the lower end of the inlet pipe. (4) Outlet shafts may be dispensed with, except for flat gradients. (5) The form of outlet shaft is more effective.

#### Leicester Bricklayers' Labourers' Strike.

—The conference convened by the Leicester Society of Architects between representatives of the Master Builders' Federation and the local branch of the Bricklayers' Labourers' Union, in the hope of bringing about an amicable settlement of a long-standing dispute, was continued last Thursday afternoon in the Old Town Hall. Alderman Sawday presided, and was supported by Alderman Wakerly, Mr. Paget, and Mr. H. H. Thompson, of the Architects' Society. At the previous conference the Society of Architects suggested, as a compromise, an advance of a farthing on the sixpence per hour which the men had been receiving up to the time of their ceasing work. The suggestion was accepted by the master builders, but was rejected by the men, whose representatives stood out for their original demand, viz., an advance of one half-penny. The conference, after having sat three hours, broke up without any good object having been achieved beyond the bringing of the parties together.

## THE PLASTERERS' DISPUTE.

A CONFERENCE of the National Association of Master Builders of Great Britain and Ireland and the National Association of Operative Plasterers met at the Salisbury Hotel, Fleet Street, E.C., last Wednesday, for the purpose of considering points arising out of the recent settlement. The masters were represented by Mr. B. J. Greenwood (London), Mr. T. Gregory (London), Mr. G. Nichols (Leicester), Mr. J. Higson (Manchester), Mr. W. Cunliffe (Bolton), and Mr. J. W. Sugden (Bradford). The men's delegates were Mr. M. Deller, general secretary National Association Operative Plasterers; Mr. M. Jones, president; Mr. G. Jackson (Manchester), Mr. Dan Hennessey (London), Mr. A. McLeod (Newcastle), and Mr. G. Duckett (Birmingham). Mr. Hassall, secretary of the National Master Builders' Association, was also present. Mr. E. T. Cook, editor of the "Daily News," was voted to the chair. The grievances of both sides were brought forward, each side alleging in turn that the other was not duly carrying out the terms of the settlement of May 30. Each side in turn tendered explanations, and it is to be hoped that the exchange of views will tend to relieve local friction. From Manchester it was reported that the men declined to return to work until an advance in wages was granted. It was pointed out on the one side that the general settlement was irrespective of the question of wages, and that the men ought to have returned to work forthwith; and, on the other, that the general settlement could not debar local associations of the men from seeking such rise of wages as they considered themselves entitled to. After a long discussion, Mr. Deller, the Secretary of the National Association of Operative Plasterers, undertook to visit Manchester at an early date with a view of using his good offices to obtain a compromise on the point in dispute. This offer was accepted by the representatives of the masters. From Rochdale, Ashton-under-Lyne and Stalybridge it was reported that local rules embodying the general settlement had not yet been put in force, owing to the local associations of masters requiring a differential scale of wages according as the work was done for master builders or master plasterers respectively. After some discussion, the chairman said he gathered that the National Association of Master Builders, as such, had no cognizance of any such differential rates, and were not prepared to approve of them. This statement of the case was accepted, and it was agreed to call a meeting of the Lancashire and Cheshire Federation at once to settle the points at issue, Mr. Deller meanwhile agreeing to suspend any strike in the localities affected.

From London and several other places it was complained by the masters that the men had refused to return to work on certain jobs or with certain employers on account of the employment of non-union men. It was contended that this was a breach of the settlement. The men, on their side, relied on the words of the settlement, which declared the objection of the Operative Plasterers to work with "defaulters and other men who have been shown to the employers to have made themselves specially objectionable to the union men." They maintained that all "black legs" were objectionable, and explained in some specific cases that defaulters were being employed. Several detailed cases where difficulties had arisen were gone into, but these, it was urged, were exceptional cases, and in a great many others no hitch had occurred.

A vote of thanks to the chairman was proposed by Mr. T. Gregory and seconded by Mr. M. Deller. Mr. Cook thanked them for their appreciation of his services. He said that as far as he could see, only three important questions of difference were involved. One was the question of the differential rates of wages that they had been discussing. He hoped that would be settled by the proposed local conference. The second important question of wages would, it was hoped, be settled by Mr. Deller's good offices at Manchester. With regard to the third point,

perhaps on that no very precise agreement had been reached—viz., the question of black-legs. It struck him very much in the course of the afternoon, that when either side proceeded to draw up a hard and fast definition, they were sure to get rather wide apart. But, at the same time, he could not help observing that when they got into details the difference tended to diminish. The subject was one which required treating with tact on both sides.

## Masters and Men.

**Working of the Conciliation Act.**—The second report by the Board of Trade of proceedings under the Conciliation Act of 1896 was published the other day, and covers the two years from July, 1897, to the end of June last. The number of disputes in which action was taken or invited shows some falling off compared with the first report, the total amounting only to thirty-two, of which twenty-two were settled under the Act. Nine of the settled cases arose in the building trade, two in the metal, engineering and shipbuilding trades, six in mining, and five in miscellaneous trades. One case, which was settled, came from St. Helens, and 300 joiners and carpenters were affected, but there was no stoppage of work. Another case, affecting 300 hands in the same trade, came from Wigan, and here again the Board of Trade appointed an arbitrator, with the result that the matter was settled without a cessation of work.

### Glasgow Corporation Employees' Wages.

—A mass meeting of the Glasgow Central Branch of the General Labourers' Union was held recently in the Albion Halls, College Street, "to consider the grievances and complaints of the cleansing and sewage works employees." A resolution was adopted requesting the following concessions for men in the Cleansing Department:—An advance of 6d. per day in wages of all grades; a fifty-one hours' week, stopping time on Saturday being 1 p.m.; double time for Sunday work; and ten days' annual holiday with pay. The Sewage Department employees made the following demands:—That all workers with a wage less than 24s. per week should receive 6d. per day advance; double time for Sunday labour, and time and half for all overtime; ten days' annual holiday and pay. It was agreed to send the resolutions to the committees having charge of the departments.

### The Loss of an Eye—Interesting Point.

—Sheriff Spens, on Monday last week, issued his decision in an interesting action under the Workmen's Compensation Act. The plaintiff was a labourer named John Geary, of 7, Calder Close, Coatbridge, and in February he sued Dixon (Limited), coal and iron masters, of Glasgow, for compensation for the loss of his right eye while in their employment as an assistant furnaceman. The claim raised by him was for the difference between the amount of his average weekly earnings before the accident (30s. 8d.) and the average amount he was able to earn after it (21s. 6d.). His Lordship awarded the amount of his claim in a judgment on 14th February last. The defendants contended that the statute provided that only half of the difference in the earnings should have been awarded, and they took a stated case to the Court of Appeal, which, however, upheld the Sheriff's decision. Last week the defendants were allowed a proof as to the alleged discontinuance of the plaintiff's partial incapacity, in respect of which he had been granted the allowance of 9s. 2d. per week; and, following that proof, his lordship issued a judgment in which he found that the plaintiff was no longer incapacitated from pursuing the occupation which he was following at the time of the accident, and therefore ends and determines the weekly allowance of 9s. 2d. No expenses were awarded. In a note his Lordship quoted the evidence of four witnesses who had lost the sight of an eye while working as assistant furnace keepers, and all of whom

said this in no way affected their efficiency to perform the duties of their calling. In face of such evidence, now that the inflammation in plaintiff's eye had disappeared, and that it was simply a dead eye, it could no longer be held that he was incapacitated from pursuing his former avocation, which, according to the evidence, was offered him. All that the Act provided for was a weekly allowance during partial or total incapacity.

**Danish Labour War.**—Mr. J. Macdonald, the secretary of the London Trades Council, received notice at the beginning of last week that another 20,000 men have been locked out in Denmark in connection with the big dispute now going on in that country. The object of the employers is to destroy the Federation of Trade Unions which has secured so strong a hold on the workmen of the country. Practically all the workpeople in the country are members of the Federation, which has a membership of 80,000. Forty thousand were locked out eight weeks ago, and thus to-day three-fourths of the members of the Federation are idle. The London Trades Council has collected and despatched £400 for the aid of the locked out, and the Amalgamated Society of Engineers has sent £800 to the engineers in Denmark, who have not until now been compelled to ask for assistance from the general funds.

**The Building Trade Dispute.**—A conference between representatives of the various trade unions in the building trades and the National Association of Master Builders was held yesterday at the Salisbury Hotel, Fleet Street, E.C., to discuss points at issue between the parties, and to consider a scheme to establish a board of conciliation for the prevention and settlement of disputes, which had been submitted by the representatives of the men. One of the conditions on which the conference was held was that on the joint committee of the trade unions formally agreeing to take part therein the Yorkshire lockout should be declared at an end pending final settlement. Mr. Gregory, of Battersea, presided. The proceedings were private, and at their conclusion it was stated by Mr. Hassall, the secretary to the National Association, that the conference had considered the points raised by the Yorkshire Federation. Attention had also been given to the draft proposals for the establishment of a conciliation board, and the meeting had adjourned that these might be laid before the masters and the unions for acceptance, the delegates to meet at such time as the joint secretaries might advise. The proposals as to the board were accepted with little alteration. The principal features of the Board were thus set out:—"The objects of the Board shall be to adjust by conciliatory means all questions relating to hours, wages and working rules generally that may arise, and may be referred to by either employers or employees, and by mediation prevent strikes and lock-outs, and assist in the settlement of disputes that may take place. There shall be district committees equally representative of the employers and employees, and a central board similarly representative of the National Association of Master Builders and the other societies, parties to this agreement. In the event of any dispute arising between the members of a society or societies and the employers, and failing a settlement between the disputants locally, the question at issue shall be referred to the district committee, and should this body fail to agree, the matter shall be referred to the Central Board, and, failing a decision on this part, the matter shall be laid before a board of disinterested referees, whose decision shall be binding on both sides. In all cases work shall go on without stoppage pending a settlement." A joint meeting has been arranged between the Yorkshire employers and the Bricklayers' and Carpenters' Trade Unions to deal with the disputed matters in Hull. At the beginning of last week the Amalgamated Society of Carpenters and Joiners withdrew its members from all the Federation shops in Leeds, but subsequently the men returned to their work.

## Builders' Notes.

**The New Drill Hall, Weymouth,** is being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**Damages for Slander.**—In the Edinburgh Court of Session, last Wednesday, the trial took place of an action by John Wilson Bruce, accountant, of Glasgow, against J. M. Smith, Limited, proprietors and publishers of the "Glasgow Evening News," in which the plaintiff sued for £2,000 as damages for alleged slander. He complained of a paragraph which the defendants published on October 18th, 1897, regarding a building which he had erected in New City Road, Glasgow. Part of the building collapsed on account, the plaintiff said, of bad foundations, but the damage was put right. The paragraph complained of stated that signs of fresh weakness were already evident in the reconstructed building, and concluded with the expression: "The Master of Works may hear that his services are required when the tenement comes down with a run for the second time." The statement, it was maintained, had the effect of depreciating the plaintiff's property, and was slanderous. The defendants maintained that the paragraph, so far as it consisted of statements of fact, was substantially true, and that it was a legitimate comment upon a matter of public interest. The jury returned a unanimous verdict for the plaintiff, and assessed the damages at £450.

**Electric Light Advertisements.**—The Universal Electric Advertising Syndicate, of 2, St. Peter's Church Walk, Nottingham, was summoned at Marlborough Street Police Court last week by the London County Council for erecting at 3, Oxford Street, W.C., a structure which projected beyond the general building line, contrary to the provisions of the Building Act. Mr. Chilvers, for the L.C.C., said that the structure complained of was an electric light advertisement erected in front of the fourth storey of the building, which was situated at the junction of Oxford Street and Charing Cross Road. The advertisement was 23ft. long and 10ft. 4in. wide, covering the whole front of the fourth storey, and projected over 2ft. beyond the general line of building. It contained about 1,000 electric lights, worked from the inside, which formed into groups and made the letters of the advertisement. The whole structure was of iron. Thomas Barrett, architect and surveyor from the offices of the County Council, gave a detailed description of the structure, and stated that it projected 2ft. 3in. from the general building line. On cross-examination, he admitted there was no danger; it was securely fixed up. Other signs in the neighbourhood projected further than the one complained of. It might have cost £1,000 to erect. Counsel for the defendants said that the general building line was not defined by the County Council until after the sign was put up at a great expense. Mr. Denman adjourned the further hearing of the case for a month.

**Wooden Structures and the London Building Act.**—Last Wednesday at West London Police Court, the Albert Hall Estate Company (Limited), who are engaged in erecting a large pile of flats at the rear of Albert Hall on land belonging to the Commissioners of 1851, were summoned by the London County Council for setting up a wooden structure, which has been used as a means of approach by the tenants, without a licence, and an order to demolish it under the powers of the Amended Building Act was asked for. Mr. Chilvers, for the L.C.C., gave a reference to the different sections, contending that the corridor was a wooden structure which was not exempted. He submitted that the Legislature drew a distinction between buildings and wooden structures. Mr. Avory, who represented the company, said when the corridor

was up an application was made to the County Council for a licence. The attention of the company was called to it by the district surveyor, and an application was then made for a licence, not because one was thought necessary. If it were granted, well and good; if not, they did not want it. Mr. R. Worley, the company's architect, in giving evidence, said he had the sanction of the Royal Commissioners for the building to be erected on their land. The completed part of the building could not be used without the use of the temporary corridor. Mr. Fenwick suggested that the company should approach the County Council for the purpose of trying to meet their objections. The summons was then adjourned for four weeks, Mr. Fenwick expressing an opinion that the roofing of the corridor was undesirable.

**A Brickmaking Case.**—In the First Division of the Court of Session for Scotland, a case in an arbitration under the Employers' Liability Act, in which William Dollan, labourer, 106, Clippens Row, Johnstone, claimed compensation from his employers, the Linwood Brickmaking Company (Limited), 5, Oswald Street, Glasgow, for injury to his left hand, caused by the stamper of a stamping machine, in the respondents' brickworks, coming down upon it, was brought before the Lord President, and Lords Kinnear and McLaren. The case was stated by Sheriff-Substitute Spens, who found in fact that the appellant was engaged to work on the night shift, and obtained employment on the false representation that he was over eighteen years of age, whereas he was only sixteen. His particular work was to run a bogey loaded with bricks from the stamping machine to the kiln, and heard other two lads by arrangement known to the respondents' foreman interchanged duties. On 23rd February, the appellant took the place of another lad, M'Mahon (who was then cleaning the machine), and engaged taking bricks from the plate, and thinking that the stamper was dirty, put his left hand into the machine to clean the stamper, with the result that it came down upon his hand. It was absolutely against the rules of the work to clean the stamper until the machine was stopped, and then only by a special tool provided for the purpose called a scraper. On these facts the Sheriff-Substitute held that the accident did not arise out of and in the course of the employment of the appellant, and that the accident was attributable to the serious and wilful misconduct of the appellant, in respect he would not have been employed on the night-shift had it not been for his fraudulent misrepresentation as to his age; compensation was, accordingly, refused. The questions in law for the opinion of the court were: (1) Whether the accident to the appellant arose out of his employment with the respondents; and (2) whether the accident was attributable to the serious and wilful misconduct of the appellant. The Court now answered the first question in the negative; and found the respondents entitled to expenses. The Sheriff-Substitute's decision on the second question was not supported by the respondent's. The Lord President said the Sheriff-Substitute was right. He did not think that in every case it was a question of law whether the accident arose out of and in the course of the employment of the appellant, but they must, at all events, determine the case on the facts which the Sheriff had found. The first question was whether, assuming there was a recognised interchange between the appellant and M'Mahon of their respective duties, this occurred in the course of what was originally M'Mahon's employment. That was a question of fact which the Sheriff had decided, and when they examined the facts it did not appear as an express finding or as matter of legal or even of natural inference that it was part of M'Mahon's duties to clean that machine at all; and as the original employment of the appellant was something totally different, it fell to him to make out that his change of work had the sanction of his employers. He was for answering the first question in the negative. The finding of the Sheriff on the second question was not maintainable, and was not supported.—Their Lordships concurred.

**Improvements at Newcastle.**—At a meeting of the Town Improvement Committee of the Newcastle Corporation last Wednesday plans were passed for the erection of an ice factory and cold stores in St. Mary's Street, Quayside. The proposition to widen High Bridge was agreed upon. The Committee had under consideration plans for the erection of a portico to the entrance of the County Hotel, which is at present undergoing extensive alterations. The portico is described as being a valuable acquisition to the appearance of the building. The application was ordered to stand over until next meeting, the plans, in the meantime, to be subjected to certain alterations. Plans were presented for no fewer than 130 houses to be erected, principally on the outskirts of the City; in addition, plans were presented for works, shop fronts, and alterations and improvements of premises in almost all parts of the city.

**A Foreman's Wages Case.**—At the Walsall Assizes held last week, Joseph Holden, Queen's Place, Wednesbury, was summoned by Mr. F. W. Cross, engineer and architect, of Walsall, for £2 for neglect of work between the 3rd and the 13th inst., and also for £2 money overpaid in respect of wages and expenses. Plaintiff was carrying out work under the Corporation at Leeds, and sent defendant as foreman to superintend the job. He gave defendant £3 to cover his expenses and on account of wages, but three days later defendant wrote for £4 more. Plaintiff thought that excessive and only sent £3, whereupon defendant wrote that he should not stay on the job and went away, and plaintiff claimed £2 out of the £6 he had sent, and £2 for leaving without notice.—Defendant put in a statement that he had spent £6 10s. on plaintiff's behalf, but on the items being examined that was reduced to £5 10s., and an order was made for defendant to pay £2 10s. and costs.

## Surveying and Sanitary Notes.

**Proposed Improvements at Wallasey.**—Mr. G. W. Wilcocks, a Local Government Board inspector, held an inquiry last Thursday, on behalf of that body, into an application by the Wallasey Urban District Council for sanction to borrow £7,580 for the construction of a new road from Wallasey village to the shore; £4,318 for the improvement of Poulton Road, Seacombe; and £300 for the provision of an underground convenience in Liscard Road.

**Douglas Improvements.**—A scheme for improving the Douglas Promenade is shortly to be submitted to the Douglas Town Council. It is proposed to build a new sea wall, and thus widen the Loch and Harris Promenades over their whole length by 40ft. The estimated cost is £50,000, and it is contended that the increase in tramway royalties will more than cover the interest and sinking fund. The improvement will allow of electric traction on the tramways, and will permit of a more effective drainage system.

**Stockport Corporation Sewage Works.**—The formal opening took place last Wednesday of the sewage outfall works just constructed by the Corporation of Stockport on the Cheadle side of the river at Heaton Mersey. Mr. Alderman Lees opened the building. He said that a little over £152,000 had been expended upon the main intercepting sewer, buildings, machinery, and land at the outfall, the land, amounting to 96 to 98 acres, having cost about £17,000. The main intercepting sewer, buildings, reservoirs and other works have been constructed by Messrs. T. and W. Meadows, contractors, of Heaton Norris; the engines and pumps were supplied by Messrs. J. and H. Gwynne, of Hammersmith; and Mr. Daniel Eadie was the contractor for levelling and draining the outfall land.

## Engineering Notes.

**Electric Lighting at Stockton-on-Tees.**—Stockton-on-Tees has formally inaugurated a scheme for the erection of municipal electric light works at a cost of £28,000.

**Fleet Church, Hants,** has been fitted with the latest improved "Small Tube" hot water heating apparatus, with special economical coil heater with water-way fire-bars, by Messrs. John King, Limited, engineers, of Liverpool.

**Harbour Extension at Stonehaven.**—It is stated that a favourable communication has been received from the Public Works Loan Commissioners in reply to the request from Stonehaven Harbour Trustees for a loan of £11,000 for harbour extension purposes.

**Eighteen Steel Bridges Ordered in America** by Russia for the railways in Eastern Asia were completed and accepted recently by the Russian agent. The bridges were completely built in ten weeks, and fifteen of them have already been shipped to Siberia.

**Electric Lighting at Derby.**—A Local Government Board inquiry was held at the Derby Town Hall recently into the application by the Derby Town Council for sanction to borrow £25,000 for the purpose of electric lighting. After the usual formal evidence the inquiry closed.

**The New Workhouse Infirmary, Liskeard, Cornwall,** is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, patent exhaust roof ventilators, and inlet tubes, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

**A Bridge Over the River Calder at Ossett.**—The Lancashire and Yorkshire Railway Company are preparing to widen their main line at Ossett and Thornhill. The line crosses the River Calder at Healey by a viaduct, and negotiations have been proceeding for some time between the Thornhill Urban District Council and the Company, the former desiring to secure the erection of a bridge for public traffic between the two townships. Terms have now been arranged for the erection by the company of a road bridge, 12ft. wide, across the river at Healey.

**The Institution of Junior Engineers,** of which the president is Sir W. H. White, Director of Naval Construction and Assistant Controller of the Navy, holds its summer meeting this year at Portsmouth and Southampton, commencing August 12. The Government establishments and engineering works in the neighbourhood are to be visited, whilst at Southampton, in addition to the London and South-Western Railway Company's docks, an inspection will be made of the North German Lloyd steamship, Kaiser Wilhelm der Grosse, and the American liner, St. Louis. The Mayors of both towns are offering entertainment to the institution.

**Dock Extension at Hull.**—The opening of the Alexandra Dock Extension took place last week. The new extension is  $7\frac{1}{2}$  acres in extent, and has been designed specially for the shipment of coal and mining timbers. It will be fitted with four coal hoists of modern pattern. The length of additional quay provided is nearly half a mile, and the depth of water will be the same as in the existing Alexandra Dock. From foundation to coping the dock walls, which are of solid concrete, average 50ft. in height, and are 22ft. wide to base. In carrying out the works nearly 400,000 yards have been excavated, and nearly 66,000 yards of concrete work have been executed. The whole of the work has been done under the superintendence of Mr. R. Pawley, M.I.C.E., the company's engineer, by Messrs. Whitaker and Sons, of Horsforth, Leeds, the contractors for the extension.

## COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>BUILDINGS—</b>			
Aug. 4	Drumhillary, Ireland—Renovating Church	Public Health Committee	H. C. Parkinson, Architect, College-street, Armagh.
" 4	Egremont, Cumberland—Shop and Warehouse, &c.	Burgh School Board	J. S. Stout, Architect, Gilfoyle, Egremont.
" 4	Treorchy—Workmen's Cottages	Rural District Council	J. Rees, Architect, Hillside, Pentre.
" 5	Ipswich—Additions to Borough Fever Hospital	Gas Commissioners	E. Buckham, Borough Surveyor, Town Hall, Ipswich.
" 5	Burntisland—Secondary School	Aberystroth School Board	R. Little, 4, St. Brycedale-avenue, Kirkcaldy.
" 5	Lisnaskea—Five Labourers' Cottages		J. O'R. Hoey, Clerk, Council Offices, Lisnaskea.
" 7	Perth—Gasworks		W. Campbell, 32, North Methven-street, Perth.
" 7	Abertillery, Mon.—Alterations, &c., to School		R. L. Roberts, Architect, Victoria-chambers, Abercarn.
" 7	Keighley—Residence, &c.	Great Western Railway Co.	W. H. and A. Suggden, Architects, Keighley.
" 8	Bynea, Wales—New Passenger Station	Corporation	Engineer, Great Western Railway Station, Neath.
" 8	Hastings—Boundary Walls	Great Western Railway Co.	P. H. Palmer, Borough Engineer, Town Hall, Hastings.
" 8	Hendford, near Yeovil—Goods Shed, &c.	Great Western Railway Co.	District Engineer, Great Western Railway Station, Taunton.
" 8	Pengyraig and Tonyrefail, Wales—Stations	Great Western Railway Co.	Resident Engineer, Theatre Royal-chambers, Cardiff.
" 8	Witchington, near Hereford—Station Buildings	J. H. Waddington	Engineer, Great Western Railway Station, Gloucester.
" 8	Halifax—Building Extension	Tramways Committee	Jackson and Fox, 7, Rawson-street, Halifax.
" 8	Sheffield—Car Sheds	Union Guardians	C. F. Wike, City Surveyor, Town Hall, Sheffield.
" 9	Hendon—Repairs, &c., to Workhouse Buildings, &c.	School Board	F. J. Seabrook, Clerk, Union Offices, Edgware.
" 9	Hexthorpe—Infant School	Board of Overseers	Architect, 11, Priory-place, Doncaster.
" 9	Leeds—Alterations to Offices	Wesleyan Chapel Trustees	Redford and Kitson, Architects, Greek-st.-chambers, Leeds.
" 9	Pilsley—Sunday Schools	Amalgamated Society of Engineers	W. J. Cutt, Padley Wood Farm, Morton.
" 9	London—General Offices	Union Guardians	C. Thompson, 203, Graham-road, Edgware.
" 9	Hendon—Repairs to Workhouse Buildings	Barra School Board	F. J. Seabrook, Clerk, Union Offices, Edgware.
" 10	Lochboisdale, Scotland—Additions, &c., to School	Committee	— Hill, Clerk to Board, Lochboisdale.
" 10	Wrexham—Ward at Infirmary	Harbour Trustees	Lockwood and Sons, Architects, Chester.
" 10	Swansea—Engine and Boiler Houses	Bermondsey Vestry	A. O. Schenk, Engineer, Harbour Offices, Swansea.
" 10	London, S.E.—Alterations to Town Hall	London County Council	Surveyor, Town Hall, Bermondsey, S.E.
" 10	Mayford—Alterations to Swimming Bath		Architect's Department, 13, Spring Gardens, S.W.
" 11	Rhyl—Intermediate School	County Council	F. H. Shaylor, Architect, Welshpool.
" 12	London, S.W.—Supply of Portland Cement	Strand Union	Manager, Works Department, Belvedere-rd., Lambeth, S.E.
" 15	London, W.C.—Repairs, &c., to Workhouse	Birkenhead Corporation	W. S. Cross and Kekwich, 18, Outer Temple, W.C.
" 15	Tramere—Additions to Science and Art School	J. Morgan	C. Brownrigg, Borough Engineer, Town Hall, Birkenhead.
" 16	Dinas Powis, Wales—Pair of Villas		W. H. D. Caple, 1, St. John's-square, Cardiff.
" 18	Filey—Coastguard Buildings		Coastguard Station, Filey.
" 18	Kirkwall, Orkney, N.B.—Coastguard Buildings	Town Council	Watch Room, Coastguard Station, Kirkwall, N.B.
" 20	Portsmouth—Decorating Room, &c., at Town Hall	Corporation	Town Clerk, Town Hall, Portsmouth.
" 21	Southsea—Technical Schools and Fire Station	Corporation	W. H. Snow, Town Clerk, Southsea-on-Sea.
" 31	Sunderland—Workmen's Dwellings	Corporation	Borough Surveyor, Town Hall, Sunderland.
Sept. 1	Malmö, Sweden—Electric Works	Town Council	Clerk, Gasworks, Malmö.
" 12	Croydon—Superstructure of Asylum	R. Hayward	Borough Engineer, Town Hall, Croydon.
No date.	Tonbridge—Five Villas	Wesleyan Chapel Trustees	Neve and Sons, 1, Rank-street, Tonbridge.
"	Thornton Heath—Chapel		F. W. Ledger, 8, Philpot-lane, E.C.
<b>ENGINEERING—</b>			
Aug. 4	London S.W.—Conduit and Wiring Work	Bridgewater Trustees	O'Gorman and Cozens-Hardy, 66, Victoria Street, S.W.
" 4	Basingstoke—Laying Water Main	Union Guardians	R. S. Wallis & C. Smith and Son, Architects, Basingstoke.
" 5	Southampton—Dredging Work	Harbour Board	A. H. Skelton, Clerk, Town Quay, Southampton.
" 7	Bakewell—Gas Mains	Urban District Council	T. W. Tiplady, Manager, Gasworks, Bakewell.
" 7	Blackburn—Abutments to Bridge	Highways Committee	W. Stubbs, Borough Engineer, Town Hall, Blackburn.
" 7	Blackburn—Steel Bridge	Highways Committee	R. E. Fox, Town Clerk, Town Hall, Blackburn.
" 8	Salford—Eight Dynamos	Rural District Council	L. C. Evans, Town Clerk, Town Hall, Salford.
" 8	Bristol—Railway Lines	Great Western Railway Company	Engineer, Paddington Station, W.
" 9	Christania, Norway—Copper Wire Insulators, &c.	State Railways Administration	Commercial Department, Foreign Office, S.W.
" 9	Halifax—Electric Lighting School	Technical Instruction Committee	Borough Electrical Engineer, Foundry-street, Halifax.
" 9	Kingswood Hill, near Bristol—Pumping Plant	West Gloucestershire Water Co.	E. D. Marten, The Birches, Codsall, Wolverhampton.
" 9	St. Albans—Laundry Machinery	Workhouse Guardians	H. E. Hansell, Architect, Granville-road, St. Albans.
" 10	Stokesley—Stone Bridge	Rural District Council	W. H. Dixon, Surveyor, Kirby-in-Cleveland.
" 11	Hensbridge, Somerset—Reservoir	Wincanton Rural District Council	C. Coombes, Engineer, Tisbury.
" 11	Tarvin, Cheshire—Waterworks	District Council	H. B. Killon, 22, Cooper-street, Manchester.
" 12	Biddulph—Water Supply	Urban District Council	C. R. Hall, 1, West-street, Congleton.
" 12	Goole—Heating, &c., Public Baths	Urban District Council	F. Chambers, Surveyor, Goole.
" 12	Ibiza, Spain—Harbour Works		Government of the Balearic Islands.
" 14	London, S.W.—Gasholder	Wandsworth and Putney Gaslight and Coke Company	H. H. Jones, Engineer, Gasworks, North-street, Wandsworth, S.W.
" 16	Great Crosby, Lancs.—Tramway, &c.	Urban District Council	S. B. Cottrell, Overhead Railway, James-street, Liverpool.
" 24	Plymouth—Outfall Sewer, &c.	Corporation	J. Mansergh, 5, Victoria-street, Westminster, S.W.
" 28	Willesborough, Kent—Water Supply Works	East Ashford Rural District Council	Bailey-Denton, Son and Lawford, 9, Bridge-st., Westminster.
" 31	London, S.W.—Crane, &c.	St. Mary's Vestry, Battersea	Vestry Clerk, Municipal-buildings, Lavender-hill, S.W.
<b>IRON AND STEEL—</b>			
Aug. 4	Hastings—Wrought-iron Fencing	Corporation	P. H. Palmer, Borough Engineer, Town Hall, Hastings.
" 7	Dublin—Railway Stores	Cavan and Leitrim Railway Co., Limited	P. MacNulty, 37, College-green, Dublin.
" 12	Rio de Janeiro—Steel Rails, Bolts, &c.		Manager, Central Railway, Rio de Janeiro.
<b>ROADS—</b>			
Aug. 4	Wanstead—Granite, &c.	Urban District Council	W. Blewitt, Clerk, Council Offices, Wanstead, N.E.
" 5	Sunderland—Materials	Rural District Council	T. Young, Surveyor, Council's Offices, Sunderland.
" 7	Droxford—Hire of Steam-Roller	Rural District Council	F. Clark, Clerk to Council, Bishop's Waltham.
" 7	Ogmore—Limestone, &c.	Urban District Council	Council's Surveyor, Office, Blackmill.
" 7	Jarrow—Paving, Channelling, &c.	Urban Sanitary Authority	— Petree, Borough Surveyor, Jarrow.
" 8	Christchurch, Hants—Quartzite	Corporation	E. I. Legg, Borough Surveyor, Town Hall, Christchurch.
" 15	Felixstowe—Road Works and Granite	Urban District Council	G. S. Horton, Surveyor, Town Hall, Felixstowe.
" 15	Neath, Wales—Tar Paving	Town Council	Borough Engineer, Gwyn Hall, Neath.
" 15	Romford—Granite	Urban District Council	Surveyor to Council, Romford.
" 16	Burham, Kent—Approach	Parish Council	A. Neale, Burham.
<b>SANITARY—</b>			
Aug. 4	Wanstead—Stoneware Pipe Sewers, &c.	Urban District Council	Surveyor, Council Offices, Wanstead, E.
" 15	Ensom—Sewerage Works	Rural District Council	Beesley, Son, and Nichols, 11, Victoria-street, Westminster.
" 15	Witney—Drainage Works	Urban District Council	N. Laidy, 16, Great George-street, Westminster.
" 21	Leigh-on-Sea—Town Sewerage Works	Urban District Council	Bailey-Denton, Son & Lawford, Palace-chbrs., Westminster.
" 24	Plymouth—Sewerage Works	Corporation	J. Mansergh, 5, Victoria-street, Westminster.
